Audio Interchange File Format: Sound Files To Windows

I'm looking for information on the Audio Interchange File Format (AIFF) that I've seen sound files available in. Is AIFF a standard with Mac OS? Can it be used with Windows? How can I move sound files to DOS/Windows?
This article has been archived and is no longer updated by Apple.
AIFF sound files are the standard file format defined by Apple and several third-party developers for sampled (digitized) sound.

However, Windows only works with AIFF in a few applications. Windows uses .WAV files as its own file format for digitized sound. Unless the application you are using in Windows works with AIFF files, a simple transfer of the sound file won't provide a usable Windows sound file.

The AIFF sound file has header information that can be followed by a variety of "chunks." One of these chunks represents a linear sampling of audio waveforms stored as bytes. A general overview of AIFF files is in Chapter 22, The Sound Manager, of Inside Macintosh VI. A more complete description of the AIFF file format is available from Apple's developer web site at:

http://www.apple.com/developer/

Nothing in the Windows/MS-DOS environment can directly understand the header information. Therefore, you need to do a file conversion. There are several Macintosh applications and shareware utilities that allow you to convert AIFF files into WAV files.

Mac OS: Maximum Size of the Note Pad

What is the limit to the size of the Note Pad file?
This article has been archived and is no longer updated by Apple.
The practical limit of each page of a Note Pad in Note Pad version 7.5 is 32,700 characters. Note Pad 7.5 is included with Mac OS 7.5 and later.

Earlier versions of Note Pad are limited to 8 pages total.

For information on working around these limitations, please see Knowledge Base article:

Article 25127: "Mac OS: Using Multiple Note Pads and Scrapbooks"
Published Date: Feb 20, 2012

Apple Hardware: See Manual for Care and Cleaning Information

Refer to the manual that came with your Apple product for recommendations and instructions on how to clean it.
This article has been archived and is no longer updated by Apple.
The manual that comes with each Apple product contains basic care and cleaning instructions. You can find the specific page numbers for this information in the manual's table of contents.

Some cleaning procedures must be performed by Apple Authorized Service Providers. If you cannot find cleaning instructions for your particular needs in the manual, contact your Apple-authorized reseller or Apple Authorized Service Provider.

How to clean edge connectors on cards

Technicians agree that the most difficult troubleshooting involves intermittent symptoms, and that many of these can be traced to dirty electrical connections or connectors.
This article has been archived and is no longer updated by Apple.

Inspecting an Edge Connector

1. Make sure the card is not receiving electrical power. If necessary, turn off and unplug the device housing the card.
2. Touch an electrically grounded area to rid yourself of static electricity. For example, touch the power supply or the metal chassis frame of the computer. Once this is done, do not shuffle your feet or move your body in a way that will create a new static electric charge.
3. Handling the card by its edges as much as possible, remove the card from its slot or connector. Do not touch electronic components or the edge connectors.
4. Visually inspect the edge connectors for signs of dirt or contamination. A magnifying glass may help.

   Cleaning an Edge Connector

   Here are two methods for cleaning edge connectors:

   Pencil eraser

   Use an ordinary pencil eraser to clean the edge connectors. Blow the eraser crumbs away; do not wipe them away with your fingers.

   Stabilant-22A

   Stabilant 22-A is a contact-enhancing product by D.W. Electrochemicals Ltd.; their website is at http://www.stabilant.com/ .

   Stabilant 22-A is a non-conductive block polymer that becomes conductive in the presence of an electrical field or when placed in a very narrow gap between electrical contacts. It remains non-conductive between adjacent contacts in a multiple-pin environment. Users of this product report that it works well on a variety of connections. It can also be used for audio and video connectors.

   [**Important:** Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

AirPort Base Station: How to Set Up File Sharing Between AirPort and Ethernet Computers

Computers connected to an AirPort Base Station (Graphite) may not be able to share information with each other if bridging is turned off. For the AirPort Base Station (Dual Ethernet) and AirPort Extreme Base Station, bridging from wireless AirPort clients to the LAN port is automatically enabled.
This article has been archived and is no longer updated by Apple.

Symptom

An Ethernet (wired) computer and an AirPort (wireless) computer successfully connect to the Internet through an AirPort Base Station, but attempts to set up File Sharing or any TCP/IP services between them on the local network fail.

Click here if you are using the AirPort Base Station (Dual Ethernet).

Solution

An AirPort Base station treats Ethernet and AirPort as two disconnected network segments. Turning on the "AirPort to Ethernet bridging" option in the AirPort Admin Utility allows you to connect those two segments for services such as File Sharing. For detailed instructions and information on designing an AirPort network, review the document "Designing AirPort Networks" to see what works best for you. You may find the document at Apple Software Updates (http://www.apple.com/swupdates/).

If you have a cable modem and need to bridge Ethernet and AirPort, see this article:

Article 106021: "**AirPort: How to Set Up Bridging When Using a Cable Modem**"

Important: Bridging may adversely affect other network services in certain environments. If you have a cable modem, you should not use the AirPort Base Station for bridging combined with NAT (network address translation) and DHCP services. NAT and DHCP services may be run on a separate router.

Note: Computers that are set up as AirPort software base stations do not have a bridging feature.

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: **"AirPort: How to Use with AOL**." Range may vary with site conditions.

Sharing with AirPort Base Station (Dual Ethernet) or AirPort Extreme Base Station

Bridging from wireless AirPort clients to the LAN port of the AirPort Base Station (Dual Ethernet) and AirPort Extreme Base Station is automatically enabled. You do not need to follow these steps. You may share across the WAN port when you are not using network address translation (NAT) to share a single IP address.

Published Date: Oct 3, 2008

AirPort Base Station (Graphite): How to Set Up Bridging When Using a Cable Modem

Users of cable modems may use one of two network strategies when bridging Ethernet (wired) and AirPort (wireless) computers with an AirPort Base Station (Graphite).
This article has been archived and is no longer updated by Apple.

Designing AirPort Networks

To follow the directions in this article, you will need the document "Designing AirPort Networks," available in article 75138: "**Designing AirPort Networks**"

If you do not have a cable modem or would like an example of why you might wish to use bridging, see related article 106016: "**AirPort: How to Set Up File Sharing Between AirPort and Ethernet Computers**"

Bridging With a Cable Modem

If you have a cable modem and need to bridge Ethernet and AirPort, you may consider one of these two solutions:

An IP Address for Each Computer

- Obtain additional DHCP leases from your Internet Service Provider for each computer on your network. A DHCP lease is the ability for one computer to obtain the IP address necessary to connect to the Internet. If your cable provider uses static IP addresses instead of DHCP service, obtain additional static IP addresses.
- Set up the AirPort Base Station as a bridge only as described in the document "Designing AirPort Networks."

Add a Router

- Set up a separate router on the network for DHCP and NAT services. For information on locating a router or routing software, you may search the Macintosh Products Guide (http://guide.apple.com). Routers come in many sizes, from industrial strength to table top. A computer with two Ethernet interfaces and routing software may also serve the same purpose.
- Set up the AirPort Base Station as a bridge only as described in the document "Designing AirPort Networks."

Important: Bridging may adversely affect other network services in certain environments. If you have a cable modem, you should not use the AirPort Base Station for bridging combined with NAT (network address translation) and DHCP services. NAT and DHCP services may be run on a separate router.

Note: Computers that are set up as AirPort software base stations do not have a bridging feature.

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**"

Published Date: Feb 19, 2012

Macintosh Manager: Ways to Mount Volumes

Using the method presented here, you may mount (connect to) volumes for use within the Macintosh Manager environment.
This article has been archived and is no longer updated by Apple.
When a student logs in at a Macintosh Manager client workstation, that computer by default connects to the Macintosh Manager shared folder on the startup volume of the designated authentication server. Using the following techniques, other volumes may be accessed or used for storage.

Terminology: What is a "volume," or an "authentication server"?

A "volume" is a unit of storage. Physically speaking, examples of a volume include:

- hard disk
- hard disk partition
- CD-ROM disc
- an array of disks (RAID)

A volume behaves as a single, independent disk on the desktop, regardless of its physical form. Additional volumes may be physically connected to the authentication server or to other computers. A multi-volume or multi-server setup may be attractive or even necessary when each of a large number of students needs to store a relatively large amount of data, such as an iMovie project. When connecting to a server, a share point (whether a single folder or an entire disk) also behave as a volume.

A "share point" is a folder or volume that has been designated for sharing by an AppleShare IP or Mac OS X Server.

"Authentication server" is a specific way of referring to the Macintosh Manager server to which a student logs on when beginning a Macintosh Manager session. Because it verifies the student's name and password, it is called an "authentication" server. The authentication server uses either AppleShare IP or Mac OS X Server in conjunction with Macintosh Manager software. In advanced setups which may include multiple servers, understanding which is the authentication server is important.

Common reasons that Macintosh Manager users may want to add volumes include:

- to create Group Documents folders on other volumes to expand total storage area
- to give access to remote files or applications

The steps presented here require that you know how to set privileges in AppleShare IP. For general questions about setting privileges, see these documents:

60612: "**AppleShare IP 6.3: About Sharing, Share Points, and Access Privileges**"
31265: "**Macintosh Manager 1.3: Saving Workgroup Documents to Another Volume**"

The Multiple Users User/Macintosh Manager User

When Macintosh Manager users are at the log-on screen, they connect to the Macintosh Manager authentication server via a special AppleShare user. If the authentication server is using AppleShare IP, that user is named Multiple Users User. For authentication servers using Mac OS X Server, that user is named Macintosh Manager User. If a user logs on to a workgroup that has a Documents folder outside the default Macintosh Manager volume on the authentication server, the authentication server disconnects that user from the default volume and automatically forwards the user's connection to the correct volume--a process that is transparent to the user.

Note: When an added Documents volume is local (physically connected) to the Macintosh Manager authentication server, users who belong to more than one workgroup will not be able to switch between them while logged on. In other circumstances this may be possible via the Macintosh Manager Icon in the menu bar. Users affected by this may switch workgroups by logging off and logging back on to the new workgroup.

Here's a simple test for determining if your Multiple Users or Macintosh Manager User has appropriate access to a volume:

1. Open the Macintosh Manager admin application.
2. Log on to your server.
3. Open the Chooser.
4. Click AppleShare.
5. Double-click the authentication server name. You should already be connected as "Multiple Users User" or "Macintosh Manager User".
6. Click Connect.

You should now see the list of volumes to which the Multiple Users User or Macintosh Manager User has access. If the volume you need to mount does not appear in the list, make sure that the Macintosh Manager User or Multiple Users User has read or read-write privileges to the volume.

Important notes for setting privileges:

- The only volume of which the Multiple Users User or Macintosh Manager User should be the Owner is the Macintosh Manager shared folder on the authentication server.
- All other volumes accessed by a workgroup (for Documents volumes, general storage, or application use) should have the Multiple Users User or Macintosh Manager User listed in the User/Group field with read-write access.
- Each of these additional volumes should be assigned its own unique AppleShare user as Owner. Each of these AppleShare users should have a password that is not the same as the server administrator's.

Once you have successfully logged on, follow these steps to connect to a volume automatically for members of a workgroup:

1. Open the Macintosh Manager application from the administration computer, not at the server.
2. Click the Workgroups tab.
3. Click the Volumes tab.
4. Click Chooser.
Note: Skip steps 4 and 5 if the volume you want to add already appears on your desktop.
5. Use the Chooser to connect to the volume you wish to add.
6. In the Volumes field, click the name of the volume.
7. Click Add.
8. In the "Mount at log in" field, click the name of the volume.
9. Click the radio button next to "Log in automatically as the following AFP user."
10. Enter a user name and password.
Note: You should not use the name of a user that is designated Owner or Administrator in the Users & Groups list of the Mac OS Server Admin. When mounting a volume that is physically connected to the authentication server, you want to use the user name that was created for the owner of that specific volume (see above paragraph). When mounting volumes that are physically connected to a different computer, choose a user from that computer's Users & Groups list that has appropriate privileges for the volume.
11. Click Save.

You do not need to check the box next to "Always try automatic log-in with user's name and password first."
Published Date: Feb 17, 2012

Macintosh Manager 1.3: Moving Macintosh Manager Folder to Another Volume

When considering a move of the Macintosh Manager folder, it is best to copy only the Users folder.
This article has been archived and is no longer updated by Apple.
The Macintosh Manager folder that is created on the startup disk of your Macintosh Manager server contains all the databases and initial documents and preferences for your users.

Moving the Macintosh Manager folder from the startup disk to another local disk or partition may result in stability issues with the clients and server. The most common reason administrators want to move the Macintosh Manager Folder is to utilize more hard disk space that's available for user's documents and preferences.

Rather than copying the entire Macintosh Manager folder, copy only the Users folder contained within the Macintosh Manager folder. The Users folder contains all user preferences and documents. The Users folder may be relocated to a disk or partition on the server or on a remote server.

In this configuration, the original server's startup disk remains the authentication volume for Macintosh Manager, while the users then save their documents to another volume to conserve space on the startup disk of the Server.

Once the Users folder is copied, you must change the location of the Group Documents folder in the Macintosh Manager application. For instructions, see:

Article 31265: "**Macintosh Manager 1.3: Saving Workgroup Documents to Another Folder**"

Mac OS 9.1, FireWire 2.7: Third-Party FireWire Drives May Not Recognize Audio CDs

If required software for third-party FireWire drives is not installed, these drives may not recognize audio format CDs.
This article has been archived and is no longer updated by Apple.

Symptom

Third-party FireWire drives eject or fail to recognize audio CDs.

FireWire 2.7 software, included with Mac OS 9.1, includes built-in support for third-party mass storage devices such as CD-R drives. This does not, however, eliminate the need to install any third-party software included with the drive. In the absence of appropriate third-party software, Mac OS 9.1 may allow the third-party device to recognize data but not audio CDs.

Solution

Follow the installation directions included with third-party FireWire drives for any required software.

Alternatively, you may use the Macintosh computer's built-in CD-ROM, DVD-ROM, or DVD-RAM drive for audio CDs.

Mac OS 9.1: Computer Stops Responding After Accessing Extensions Manager at System Startup Time

On some Macintosh computers, using the space bar to access the Extensions Manager at system startup time may cause the computer to stop responding (or "freeze").
This article has been archived and is no longer updated by Apple.

Symptom

After using the space bar to access the Extensions Manager during system startup time, the computer may stop responding immediately after the Extensions Manager window is closed.

Solution

1. Turn on or restart the computer.
2. Press and hold the Shift key as the computer starts up to turn off all system extensions. You may release the key when you see the "Welcome to Mac OS" screen.
3. Open the Extensions Manager control panel and make any changes.
4. Restart the computer

Published Date: Feb 17, 2012

Mac OS 9.1, 9.2, and 9.2.1: Hard Disk Space Requirements

Though Mac OS 9 requires about 320 MB of available hard disk space for installation, the System Folder is only 160 MB after restart.
This article has been archived and is no longer updated by Apple.

Symptom

The Mac OS 9 Installer may inform you that you do not have enough hard disk space to complete the installation. For example, you may see a message that contains a statement like "313 MB required, 290 MB available."

But after restart, the System Folder takes up only 160 MB of hard drive space.

Solution

During installation, several temporary folders and files are created. These require more room on the hard disk than just the amount needed to install a System Folder. If you need to make room for a Mac OS 9 installation, you can copy files to another partition or disk, then copy the files back over once installation is complete.

Mac OS 9.1: PowerBook 1400 Fails to Restart After PRAM Reset

PowerBook 1400 computers may fail to restart after resetting PRAM.
This article has been archived and is no longer updated by Apple.

Symptom

After a PRAM reset, the PowerBook 1400 may have a black screen with no lights or sound.

Solution

Press the reset button on the back of the computer to restart. This is an intermittent software behavior for PowerBook 1400 computers using Mac OS 9.1. It does not indicate a hardware failure.

Published Date: Feb 17, 2012

Mac OS 9.1: Some Preferences Are Not Retained When Updating to Mac OS 9.1

Preferences for Views, Trash, General Controls, and default Desktop Printer are not retained when updating to Mac OS 9.1. You must also re-enable Web Sharing, File Sharing over TCP/IP, and Custom settings in the Date & Time control panel.
This article has been archived and is no longer updated by Apple.

Symptom

After installing Mac OS 9.1:

- Finder Views in list or button mode change back to the default icon view.
- The Trash defaults to asking for confirmation before deleting files.
- The default Desktop Printer is no longer selected.
- The TCP/IP feature of File Sharing is disabled.
- Web Sharing is turned off.
- Settings in the General Controls control panel return to default.
- Custom settings for Time Formats and Date Formats return to the default region of the system software installed.

Solution

Some preferences are not retained during the upgrade to Mac OS 9.1. Follow these steps to restore any setting you may have lost:

- To change the way items are displayed in Finder windows, choose the appropriate command from the View menu.
- In the File Sharing control panel, click the checkbox to "Enable File Sharing clients to connect over TCP/IP."
- In the Web Sharing control panel, click Start.
- Open the Chooser from the Apple menu and use it to create a Desktop Printer.
- Open the General Controls control panel to reset settings.
- In the Time Formats and Date Formats panes of the Date & Time control panel, reselect Custom from the Region pop-up menu.
- To disable the Trash warning:
  1. Click the Trash to select it.
  2. Choose Get Info from the File menu.
  3. Click the checkbox next to "Warn before emptying" to deselect that option.

Published Date: Feb 17, 2012

AppleWorks 6: AOL Users Must First Connect to Internet to Use Web Clippings

You must make at least one IP (Internet Protocol) connection before AppleWorks 6 can access Web-based clippings.
This article has been archived and is no longer updated by Apple.

Symptom

If you connect to America Online and then immediately try to access Web-based AppleWorks clippings, this message appears:

> "You must be connected to the Internet in order to access content from a Web site."

Solution

There are three contributing factors to understand for this issue:

- Because America Online uses proprietary connection protocols, it may not make an IP connection immediately.
- Your computer's underlying IP software, or "stack," must be activated before you can make an IP connection. Most Internet applications, such as Netscape Communicator or Microsoft Internet Explorer, do this automatically.
- AppleWorks does not activate the IP stack.

To work around this issue:

1. Connect to America Online.
2. Open an Internet application, such as Netscape Communicator or Microsoft Internet Explorer, that is not a part of America Online. This activates the IP stack. Keep in mind that getting email via America Online does not necessarily activate the IP stack due to its proprietary protocols.
3. You may quit the application you used to activate the IP stack.
4. Open AppleWorks 6.

Once the IP stack is activated, you should be able to use Web-based clippings in AppleWorks.
Published Date: Feb 20, 2012

Mac OS 9.1: Some Sherlock 2 Channels May Appear Empty

On first use of the Sherlock 2, the contents of some channels may appear empty until the necessary site search plugins are automatically downloaded via the Internet.
This article has been archived and is no longer updated by Apple.

Symptom

On first use of a channel in Sherlock 2, there may be no search sites listed.

Solution

Some Sherlock 2 channels do not include the search site plugins when installed. Instead, these plugins are downloaded and installed the first time you choose a particular channel in Sherlock 2. This may take a few moments, depending on the speed of the computer's Internet connection.

For example, click on the Entertainment channel. After waiting a few moments, Sherlock should connect to the Internet, download the necessary plugins, and display the missing Entertainment search sites.

If it does not, make sure that you have an active Internet connection by performing a search using one of the other Internet channels, or by opening a Web page in your Internet browser. If you have a valid Internet connection, Sherlock should momentarily download the search site plugins and display them automatically.

Multiple Users clients may see similar symptoms the first time they access Internet channels in Sherlock 2.

For more information, please see:

Article 31154: "**Sherlock 2 and Multiple Users: Missing Channels**"
Published Date: Feb 17, 2012

Mac OS 9.1: Start Up from CD to Install on Original Power Macintosh Computers

A Mac OS 9.1 CD is required to install Mac OS 9.1 on original Power Macintosh computers.
This article has been archived and is no longer updated by Apple.
A Mac OS 9.1 CD is required to install Mac OS 9.1 on original Power Macintosh computers.

Affected computers

Power Macintosh 6100 series
Power Macintosh 7100 series
Power Macintosh 8100 series
Power Macintosh 8115
Workgroup Server 6150
Workgroup Server 8150
Workgroup Server 9150

After placing the Mac OS 9.1 CD in the drive, restart the computer. Press and hold the "c" key during system startup time. When the computer is started up from CD, you will see a unique CD desktop pattern as confirmation.

The downloadable Mac OS 9.1 update available from Apple Downloads is not compatible with original (NuBus-based) Power Macintosh computers.
Published Date: Feb 19, 2012

Mac OS 9.x: Custom Removing Internet Access

Because the Internet Access Installer relies on third-party applications, some third-party components may not be removed by a Custom Remove.
This article has been archived and is no longer updated by Apple.

Symptom

Performing a custom remove of Internet Access components from the Mac OS 9.x installer may not remove all Internet Access components.

Solution

The Internet Access Installer relies on third-party applications to install components of third-party Internet applications. The Mac OS 9.x installer cannot remove all of the third-party components.

If you need to remove all Internet Access components, disable or manually remove the following items:

Name	Location	Type
Browse the Internet	desktop	alias
Mail	desktop	alias
Register with Apple	desktop	alias
ActiveX Controls	System Folder: Extensions:	folder
Macromedia	System Folder: Extensions:	folder
Stuffit Engine	System Folder: Extensions:	extension file
Stuffit Engine Power Plug	System Folder: Extensions:	extension file
Microsoft Component Library	System Folder: Extensions:	extension file
Microsoft Framework	System Folder: Extensions:	extension file
Microsoft Internet Library	System Folder: Extensions:	extension file
MS Font Embed Library	System Folder: Extensions:	extension file

Mac OS 9 and 9.0.x only:

Name	Location	Type
Internet	Macintosh HD	folder
Internet Setup Assistant	Macintosh HD: Assistants:	alias

Mac OS 9.1 only:

Name	Location	Type
Netscape Communicator Folder	Macintosh HD: Applications (Mac OS 9):	folder
Outlook Express 5.02 Folder	Macintosh HD: Applications (Mac OS 9):	folder
Internet Explorer 5	Macintosh HD: Applications (Mac OS 9):	folder
Internet Utilities	Macintosh HD: Applications (Mac OS 9):	folder
Internet Setup Assistant	Macintosh HD: Applications (Mac OS 9): Utilities: Assistants:	alias
Internet Setup	Macintosh HD: Applications (Mac OS 9): Utilities: Assistants:	folder

Warning: Before deleting any Internet-related items, be sure that you know the location of email messages, bookmarks, or other items you may wish to save. The location to which email, bookmarks and other items are stored is determined by the third-party application developer. Possible locations include:

- the Preferences folder (America Online and Netscape Communicator, for example)
- an application's folder (Microsoft Outlook Express 4.5, for example)

- the Users folder (Microsoft Outlook Express 5.0.2, for example)

Published Date: Feb 17, 2012

Twentieth Anniversary Macintosh, Mac OS 9.1: Updating Mac OS Disables Virtual Memory

Updating to Mac OS 9.1 on a Twentieth Anniversary Macintosh disables virtual memory.
This article has been archived and is no longer updated by Apple.

Symptom

Installing Mac OS 9.1 on a Twentieth Anniversary Macintosh disables virtual memory. Alert boxes may appear with messages stating that you do not have enough available memory to perform certain tasks.

Products Affected

- Twentieth Anniversary Macintosh
- Mac OS 9.1

Solution

1. Open the Memory control panel.
2. Click On to turn on virtual memory.
3. If necessary, adjust the amount of virtual memory.

Note: Virtual memory defaults to one megabyte more than the actual amount of memory (RAM) installed in the computer (for example, 65 MB on a computer with 64 MB of physical RAM). Some applications may require that you increase the amount of virtual memory. Total virtual memory is the combination of the computer's physical RAM and space designated on the computer's hard disk for use as "virtual" RAM. As reliance on hard disk space for virtual memory increases, system performance may decrease depending on application. For best performance, add additional physical RAM.

Published Date: Feb 17, 2012

Mac OS 9.1: Pro Keyboard CD Does Not Install if Third-Party USB Card Is in Use

The Mac OS 9.1 CD included with the Apple Pro Keyboard only installs on Macintosh computers that came from Apple with built-in USB ports.

This article has been archived and is no longer updated by Apple.

Symptom

If you attempt to install the Mac OS 9.1 CD included with the Apple Pro Keyboard, an alert box appears with a message that the installer cannot be used on your computer.

This would happen, for example, on a Power Macintosh G3/233 computer with an added third-party USB PCI card.

Solution

The Pro Keyboard Mac OS 9.1 CD only works with Macintosh computers that came from Apple with built-in USB ports. If you have a computer that did not come from Apple with built-in USB ports that is using Mac OS 8.6 or earlier, you must purchase the retail version of Mac OS 9.1 to be able to upgrade. If you already have Mac OS 9.0.x installed, you may download the Mac OS 9.1 Update from Apple Software Updates at http://www.apple.com/ .

Published Date: Feb 20, 2012

Mac OS 9.1: Installer Only Updates the Startup Disk When Mac OS 8.5 or Later Is Installed

Though your Macintosh meets the stated system requirements, you may not use the Mac OS 9.1 Install CD to update an active System Folder of a version prior to Mac OS 8.5.

This article has been archived and is no longer updated by Apple.

Symptom

Though a Macintosh computer meets the stated system requirements for Mac OS 9.1, an alert box appears with a message that you cannot use the installer on that Macintosh computer.

This may happen, for example, when started up from a hard disk that contains Mac OS 8.1.

Solution

1. Startup from the Mac OS 9.1 CD by pressing and holding the "c" key at system startup time. This prevents the older System Folder on the hard disk from being active.
2. After Mac OS 9.1 finishes installing, open the Startup Disk control panel from the Apple Menu.
3. Be sure that the hard disk is highlighted in this control panel. If it is not, click its icon.
4. Close the Startup Disk control panel.
5. Restart the computer. When you restart the computer, your updated Mac OS 9.1 System Folder will be active.

Published Date: Feb 20, 2012

Mac OS 9.1, AppleShare IP 6.3: Installing Mac OS Server Admin

Installing AppleShare IP or updates of its components of version 6.3.2 or earlier (or installing the Mac OS Server Admin application included with that software) may cause the AppleShare client extension to disappear from the Extensions folder and the Chooser.
This article has been archived and is no longer updated by Apple.

Symptom

The AppleShare client disappears from the Chooser after AppleShare IP or the Mac OS Server Admin application is installed on a computer that has been updated to Mac OS 9.1.

This happens when installing AppleShare IP from disc or when using the Installer for Mac OS Server Admin found on the at the top (root) level of the hard disk.

Solution

Mac OS 9.1 installs a new version (3.8.8) of the AppleShare client extension. AppleShare IP versions 6.3.2 and earlier or the bundled Mac OS Server Admin replaces this new version with an older version (3.8.6) that was current at the time their Installers were created. Subsequently, Mac OS 9.1 disables the older version as incompatible.

You may prevent or address this issue using the approaches described here.

Installing AppleShare IP and Mac OS 9.1 on the same computer

AppleShare IP 6.3.3, announced 2001-01-09 and to be made available in the near future, is required to use Mac OS 9.1 with AppleShare IP. You should not install Mac OS 9.1 on an AppleShare IP 6.3.x server until you have AppleShare IP 6.3.3.

Mac OS 9.1 already installed, AppleShare missing

You may download and install version 3.8.8 of AppleShare from the Apple Software Updates Web site at http://www.info.apple.com/support/oldersoftwarelist.

Using a Mac OS 9.1 computer as a remote admin station

This does not require AppleShare IP 6.3.3. You may avoid using the Mac OS Server Admin Installer by following these steps:

1. Log on to the AppleShare IP server.
2. Locate the folder named AppleShare IP 6.3 at the top (root) level of the server volume.
3. From there, locate the folder named Mac OS Server Admin.
4. Copy this folder to the Macintosh using Mac OS 9.1.

Once the folder copies, you may begin using Mac OS Server Admin.

Mac OS 9.1: AppleShare Client Disappears From Chooser

Installing AppleShare IP or component updates of version 6.3.2 or earlier (or installing the Mac OS Server Admin application included with that software) may cause the AppleShare client extension to disappear from the Extensions folder and the Chooser.
This article has been archived and is no longer updated by Apple.
For a discussion of this issue, please see:

Mac OS 9.1: Downloadable update versus Mac OS 9.1 disc

The downloadable Mac OS 9.1 Update contains fewer updates and extras than the Mac OS 9.1 CD-ROM disc, to reduce the amount of data that must be downloaded at once.

You may wish to read the Mac OS 9.1: Software and Before You Install document before downloading.

This article has been archived and is no longer updated by Apple.

Mac OS 9.1 Update

The downloadable update contains core system software updates, Apple Remote Access (ARA) Client Server 4.0, and QuickTime 4.1.3. The Mac OS 9.1 download may only be used to update a computer that has Mac OS 9.0.x installed. It is available at Apple Software Updates (http://www.apple.com/swupdates).

Note: If you use Apple language kits, the disc is required to update to Mac OS 9.1.

Mac OS 9.1 Disc

The Mac OS 9.1 disc includes additional updates to Mac OS that are not a part of the downloadable Mac OS 9.1 Update. Some of these additional items are available separately at Apple Software Updates or from third-party Web sites (non-Apple software). The disc may be used for full installation or clean installation.

Items included on the Mac OS 9.1 Disc

AirPort 1.2
Aladdin Software 5.5
Apple DVD Software 2.3
Apple Internet Access 1.5.1
ARA Client Server 4.0
ColorSync 3.0.3
English Speech Recognition 2.0.4
English Text-to-Speech 2.0
Language Kits updates
Microsoft Internet Explorer 5.0
Microsoft Outlook Express 5.0.2
Mac OS Runtime for Java (MRJ) 2.2.3
Netscape Communicator 4.75
Network Assistant Client 4.0.2
Personal Web Sharing 1.5.5
QuickTime 4.1.3
System software

Items in the CD Extras folder

Additional Desktop Patterns
Additional Desktop Pictures
Additional Modem Scripts
Apple LDAP Changes
Apple Printer Utility
AppleScript CD Extras
ColorSync CD Extras
CSW 4000 Install (Color StyleWriter)
Eric's Solitaire Sampler
File Sharing Extras
FirmWare Updates
HyperCard Player
HyperCard Update
Language Kits CD Extras
Mex. Spanish Text-to-Speech
Network Extras
Palm Desktop
Pointer Mode
QuickTime Samples

Unicode
Universal Access
VideoMirroringApp
WhatRoute Folder
WorldText

Items in the Adobe Software folder

Adobe Acrobat Reader (4.05)
Adobe Type Manager / ATM (4.6)

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access".**

Mac OS 9.1: Includes Licensed Use of WhatRoute

Mac OS 9.1 includes licensed use of the WhatRoute network utility.
This article has been archived and is no longer updated by Apple.
Apple has licensed WhatRoute 1.7, a freeware utility written by Bryan Christianson, for distribution and use with Mac OS 9.1. WhatRoute is provided "as is" and is not supported by Apple. The documentation included with WhatRoute includes a description of its capabilities.

WhatRoute may be either Custom Installed using the Mac OS 9.1 Installer or manually installed by dragging the WhatRoute folder from the CD Extras folder on the Mac OS 9.1 CD to a location of your choice on the hard disk.

Notes:

1. Manual installation includes items not installed by a Custom Install: WhatRoute documentation and the PromiscuousMod extension used by the Monitor function. If you perform a Custom Install but need these items at a later time, you may manually copy them from the WhatRoute folder located in the CD Extras folder on the Mac OS 9.1 CD.

2. The stated system requirements included in the WhatRoute documentation have not been updated to reflect compatibility with Mac OS 9.1. WhatRoute works with Mac OS 9.1 and Open Transport 2.6.x and later.

3. When reading the readme.html file, clicking the link to view the Options for the Monitor function does not properly display the image file. In order to correct this, change the name of the file "MonitorPrefs.gif" to "MonitorPrefs.jpg". This file is located in the images folder inside the Documentation folder found in the WhatRoute folder.

You may also visit the WhatRoute Web site at: http://www.whatroute.net/ .

Mac OS 9.1: Changes to USB Printer Sharing 1.0.1

USB Printer Sharing 1.0.1 includes a change to network neighborhood selection and to USB PS.
This article has been archived and is no longer updated by Apple.
Mac OS 9.1 includes version 1.0.1 of USB Printer Sharing.

USB Printer Sharing 1.0.1 includes the following two changes:

1. Due to changes in NSL 1.1.3, Mac OS 9.1 includes a script that can indicate the current neighborhood as well as allow you to set the neighborhood. When you select the article "Sharing a USB printer" in Mac Help, you will see a diamond shaped icon labeled "Set my network neighborhood" that opens this script. Setting the neighborhood via entries in the Search Domain area of the TCP/IP control panel no longer works with version 1.1.3 of NSL.
2. In order to comply with changes made to Open Transport in Mac OS 9.1, USB PS no longer calls Open Transport at interrupt time.

Published Date: Feb 17, 2012

Mac OS 9.1: Open Transport 2.7.4 Cannot Be Called at Interrupt Time

Open Transport 2.7.4 returns an error if called at interrupt time, which may change the behavior of certain networking applications.
This article has been archived and is no longer updated by Apple.
Mac OS 9.1 includes Open Transport 2.7.4. A significant change in Open Transport 2.7.4 is that Open Transport no longer allows itself to be called at interrupt time. Previous versions of Open Transport did not actively block such calls. This resulted in difficult-to-reproduce software issues that might be perceived as "random" software failures. Because of this, Open Transport 2.7.4 now returns an error if called during interrupt time.

Apple has notified software developers of this change so that applications may be updated. Apple has updated USB Printer Sharing in part for this reason.

If you use a network or Internet-based application that produces a new error under Mac OS 9.1, check for updates to the affected application.

The following article can help you search for a particular vendor's address and phone number:

Article 17159: "**Locating Vendor Information**"
Published Date: Feb 17, 2012

Mac OS 9.1: Services Location Protocol (SLP) Changes

Mac OS 9.1 introduces a changes to Services Location Protocol (SLP) behavior intended to eliminate confusion between domain names and network neighborhoods.
This article has been archived and is no longer updated by Apple.
Services Location Protocol (SLP) facilitates the discovery and advertisement of TCP/IP-based services. Services such as Personal File Sharing, Personal Web Sharing, and USB Printer Sharing which advertise themselves on networks via SLP are viewable in the Network Browser and in Navigation Services.

In Mac OS 9.0.x, the network neighborhood (also know as SLP "scope") was defined by entering a domain or subdomain name in the TCP/IP control panel within the "Search domains" field. This manner of definition incorrectly suggested that scope naming must be tied to a particular domain name or should follow the naming convention associated with a domain name.

Rather, SLP scopes may be arranged according to meaningful information about their members. An SLP directory agent (DA) could specify a scope based on a logical or physical grouping. A scope, for example, could logically associate all resources pertinent to financial management with a "Finance" scope. Alternatively, resources within a scope may be associated with a physical locale such as a "Honolulu."

To eliminate confusing suggestions or assumptions about ties between TCP/IP domain names and SLP scopes, Mac OS 9.1 stores the SLP scope in an SLP Preferences file located in the Preferences folder. Scope is no longer defined in the TCP/IP control panel.

Note: When a version of Mac OS 9.0.x is updated to Mac OS 9.1, the "Search domains" field ceases its definition of SLP scope. The pre-existing scope is not automatically converted to the new SLP Preferences format. Instead, North American English and International English versions of Mac OS 9.1 use the Local Services as the default for computers that have not been configured otherwise.

Setting a new scope in Mac OS 9.1

The SLP Scope remains easily configurable via an AppleScript in the USB Printer Sharing section of Mac Help.

- Choose Mac Help from the Help menu.
- Search for the article "Sharing a USB printer."
- In that article, click the link to "Set my network neighborhood."

Notes:

1. A blank Mac Help window will remain open on your screen and may safely be closed after using the configuration script.
2. The SLPPlugin must be present and active. You can verify this in the Extensions Manager control panel.

Network administrators: setting scope via DHCP

DHCP (Dynamic Host Configuration Protocol) is a common method for offering configuration information to client computers. When Mac OS 9.1 clients are set up to configure using a DHCP server, network administrators may use the SLP Service Scope Option (DHCP option code 79) to specify the SLP scope in which the client machines should register their services.

For more information on Network Services Location Services such as SLP, please see:

Article 24691: "**Network Services Location (NSL) Technology: Description**"

The following links provide information about standards which are not defined by Apple. Apple, Inc. is not responsible for their content.

Services Location Protocol (SLP) is defined in **RFC 2608**
DHCP option 79 is described in **RFC 2610**

The following text is a reproduction of the Late-Breaking News included in Mac Help for Mac OS 9.1, which is accessible in the Help menu.

About Mac OS 9.1

This section provides current information about Mac OS 9.1.

Starting up from the Mac OS 9.1 CD

If you start up from the Mac OS 9.1 CD, some features (such as the ability to play QuickTime movies in Mac OS Help) are not available. Use of all features is restored when you restart from your hard disk.

Using Acrobat PDF documents

Some documents included with Mac OS 9.1 were created using Adobe Acrobat (these files have "pdf" at the end of their names). To view or print these documents, you must install Adobe Acrobat Reader, located in the Adobe software folder on the Mac OS 9.1 CD.

Drive Setup and Energy Saver

If you need to use Drive Setup to perform an operation that takes more than a few minutes, such as testing a disk or initializing a disk with a low-level format, make sure your system will not go to sleep by dragging the slider in the Energy Saver control panel to "Never." You can return it to your previous setting after the formatting is complete.

PowerBook (FireWire)

If you have a PowerBook with built-in FireWire ports, install the PowerBook Firmware update 2.7 to ensure that the FireWire ports work correctly. For more information, see the following Web site www.apple.com/firewire

Monitor resolution changes after installation

After you do a clean installation of Mac OS 9.1, your monitor resolution may change from its previous settings. You can change your monitor resolution back using the Monitors control panel.

America Online (AOL) and QuickTime To view QuickTime content while using America Online (AOL), drag a copy of the file "QuickTime plugin" into the AOL Plug-ins folder (located in the same folder as the AOL application), then reopen AOL.

Notes about compatibility

Apple CD-ROM extension and non-Apple CD/DVD driver incompatibilities

If your CD/DVD drive is not manufactured by Apple, or you have an Apple CD/DVD drive and you use a non-Apple driver, your CD/DVD drive may not function correctly. Remove the file named "Apple CD/DVD Driver" from the Extensions folder (in the System Folder), and reinstall the software that came with your CD/DVD drive. Contact the CD/DVD manufacturer to see if you have the latest version of their software.

Applications that install QuickTime

Some applications replace the version of QuickTime installed by Mac OS 9.1 with an earlier version. If this occurs, you need to re-install QuickTime by selecting "Add/Replace" in the Mac OS Installer, and then doing a customized installation. For more help, open Mac Help and search for "adding or removing system software."

Problems opening applications

A small number of applications will not open if the system font is not set to Chicago. Others may require additional memory. If you have problems opening an application after you've installed Mac OS 9.1, try these possible solutions:

1. Open the Appearance control panel and set the large system font to Chicago, then open the application again. Or, contact the software manufacturer to see if an updated version is available.
2. Select the application's icon, then choose Get Info from the File menu. Increase the application's minimum memory allocation by 300K. For more information, see the Memory topic in Mac Help.

Language kits

Apple's language kits are now included with the Mac OS. If you use language kits, you must upgrade both your system software and your language kits at the same time using the Mac OS 9.1 CD. Previous versions of Apple's language kits are not compatible with Mac OS 9.1. To upgrade your system software and language kits, start up from the Mac OS 9.1 CD by inserting the CD and holding down the C key as you restart the computer. Continue holding down the C key until you see the CD background. Open the Mac OS Installer and choose Customize in the Install Software panel. Select both the Mac OS Install and Language Kits, and remember to select the specific language kits you want to upgrade.

Apple HD SC Setup program

If you need to initialize your hard disk after installing Mac OS 9.1, use the Drive Setup program on your Mac OS 9.1 CD. Do not use the Apple HD SC Setup program.

FireWire hard disk drives

FireWire 2.7 includes a new built-in driver for many FireWire hard disk drives. This driver will be used automatically if the disk vendor's driver extension cannot be found. You should still install the vendor's software to get maximum features from FireWire storage devices.

Adobe Type Manager and Adobe Type Reunion

Changes in Mac OS 9.1 cause an incompatibility with Adobe Type Manager (ATM), ATM Deluxe, and Adobe Type Reunion Deluxe (ATR). The Mac OS 9.1 installer automatically moves the ATM control panel into the Control Panels (Disabled) folder during installation. The latest updates can be found at http://www.adobe.com

Notes about printing

Switching between a LocalTalk network and a serial printer

If you use the same port to alternately connect to a LocalTalk network and a serial printer, the port may not reset properly after you turn off AppleTalk to use the printer. If you have trouble printing after turning off AppleTalk, restart your computer.

Reinstalling printer drivers

If an icon for your printer is not available in the Chooser after you have done a clean installation of Mac OS 9.1, you may need to reinstall the software that came with your printer.

- If you have a StyleWriter, StyleWriter II, or StyleWriter 1200, use the Color SW 1500 driver that comes with Mac OS 9.1 (instead of installing your original printer software).
- If you have a Color StyleWriter 2200 or 2400, install the Color StyleWriter 2500 driver that comes with Mac OS 9.1 (instead of installing your original printer software).
- If you have a Color StyleWriter 4000 Series printer, you can find the latest driver in CD Extras of your system software CD.

You may also need to reinstall fonts that came with your printer software. Follow the instructions that came with your printer software.

Notes about Multiple Users environments

Using Epson printers

To print on an Epson printer, a user in the Limited or Panels environment should configure the Epson printer driver to use a spool folder located in the user's folder, or another location where the user can create files. In the Epson print dialog box, click the Tools button, then click Configuration. Then change the Temporary Spool and Temporary High Speed Copies folder locations.

Printer access in Multiple Users environments

Printers that do not appear on the desktop are not shown in the list of available printers in the Multiple Users control panel. To allow Limited or Panels users to use these printers, grant access to "all printers" or allow the users access to the Chooser.

PowerBook 5300 and voice passwords

If you have a PowerBook 5300 computer, you cannot use voice verification. You must use a typed password.

Program compatibility

If you are experiencing problems in the Limited or Panels user environments, search Mac Help for "Multiple Users" to find troubleshooting and other important information about configuring your software.

Miscellaneous notes

Changing filenames updates file modification date

If you alter the name of a file or folder in Mac OS 9.1, it will change the modification date of the enclosing folder.

RAM disk disappears when resized

If you reset the size of a RAM disk on your Mac OS 9.1 system, the icon may disappear from the desktop. Restarting your computer will bring back the icon with the new size.

Downloading disk images

If you experience problems when downloading and mounting disk images (files with the suffix ".img" or ".smi"), you may need to disable the Mount Disk Images preference in StuffIt Expander. To do this, open StuffIt Expander and choose Preferences from the File menu. Click Disk Images and deselect Mount Disk Images.

Power button sleep

Slot-loading iMacs, G4 Cubes, and most G4 towers can be put to sleep by pressing the Power button. You can turn off this feature by deselecting the Power button sleep option in the Energy Saver control panel.

Apple Remote Access Personal Server

If you are using the Apple Remote Access Personal Server and you perform a clean installation of Mac OS 9.1, the server may not answer incoming calls correctly the first time you restart the computer after the installation. Restart your computer a second time before using the Apple Remote Access Personal Server.

Developer information

Technical Note TN2010: Mac OS 9.1

TA20343_Mac_OS_LateBreaking_News.pdf

http://developer.apple.com/technotes/tn/tn2010.html

Summary from the Apple Developer Connection:

> "This Technical Note discusses changes and corrections in the next generation of Mac OS: Mac OS 9.1. This system follows Mac OS 9.0.4 and contains several enhancements and revised features. All developers interested in creating products compatible with Mac OS 9.1 will want to review this document.
>
> For the most part, Mac OS 9.1 is a system update that fixes bugs and improves operational performance and stability."

Published Date: Feb 17, 2012

Mac OS 9: "Big System Morsels" Message During Download Installation

Enabling virtual memory or starting up from CD-ROM may resolve a rare issue in which an alert box with a "Big System Morsels" message appears during Mac OS 9 installation.
This article has been archived and is no longer updated by Apple.

Symptom

During Mac OS 9 installation, an alert box appears with a message about "Big System Morsels."

Solution

Under rare circumstances a "Big System Morsels" message may appear during installation of Mac OS 9.1 Update, Mac OS 9.2.1 Update, or Mac OS 9.2.2 Update downloaded from the Web.

You may resolve or avoid this issue by taking one of these actions:

- Start up from a Mac OS disc before installing the update (as suggested in the Mac OS 9.1 "Before You Install" document).
- Turn on virtual memory in the Memory control panel If installing the update directly from a hard disk.

In the unlikely event that these steps do not resolve the issue, please see the following article for additional troubleshooting steps:

Article 25222: "**Mac OS 9: "Big System Morsels**".

AppleShare IP 6.3.x: Installing Downloadable Updates

You should install AppleShare IP 6.3.x downloadable updates in a particular order to achieve the proper software version state.

This article has been archived and is no longer updated by Apple.

There are several downloadable updates to AppleShare IP 6.3. To update your AppleShare IP 6.3 server components to the latest versions available, download and install the following components in this order:

1. AppleShare IP Update (version 6.3)
2. AppleShare IP Update (version 6.3.1)
3. Apple Share IP Agent Update (version 6.3.2)
4. Update Mac OS 9 (version 9.0.4)
5. AppleShare IP 9.0.4 Update (version 1.0)

This software is available from Apple Software Updates (http://www.apple.com/swupdates).

Notes:

1. When searching Apple Software Updates for software, do not include the parenthetical version number information listed above as a part of your search term.
2. The AppleShare IP 6.3.3 update contains all the updated components included in the listed updates.

Published Date: Feb 17, 2012

Mac OS 9, FireWire: About FireWire Versions 2.6, 2.7, and 2.8

This document describes changes introduced with various versions of Apple FireWire software.

This article has been archived and is no longer updated by Apple.

FireWire 2.6

FireWire 2.6 adds support for iBook (FireWire) computers.

Note: FireWire versions prior to 2.6 should not be installed on an iBook (FireWire) computer. FireWire 2.6 is not necessary for other computers and is only available with computers on which it shipped from Apple.

FireWire 2.7

FireWire 2.7 is part of the **Mac OS 9.1 Update**, please verify the computer's **system requirements** before downloading.

FireWire 2.7 includes a generic disk driver that works with many third-party FireWire hard drives. This driver is used by default when a third-party driver is not present. To realize full performance and features, you should still follow directions provided by a third-party drive vendor for installation of any required third-party driver or software.

FireWire 2.7 resolves two issues sometimes experienced with any earlier version:

- iMovie encounters dropped frames when capturing video from some early Digital Video (DV) cameras to a FireWire hard drive.
- PowerBook computers with FireWire PC cards connected to a FireWire DV camera may stop responding when shut down or restarted.

FireWire 2.7 resolves an issue sometimes experienced with FireWire 2.5 or an earlier version:

- With the Final Cut Pro application open, the computer stops responding while switching between DV cameras.

FireWire 2.8

FireWire 2.8 adds support for the Power Mac G4 (Digital Audio) and the PowerBook G4 computers. FireWire 2.8 is not necessary for other computers and is only available with computers on which it shipped from Apple.

FireWire 2.8.2

FireWire 2.8.2, included with Mac OS 9.2, includes a new built-in driver for many FireWire hard disk drives. This driver will be used automatically if the disk vendor's driver extension cannot be found. You should still install the vendor's software to get maximum features from FireWire storage devices.

FireWire 2.8.5

FireWire 2.8.5 is included with Mac OS 9.2.2 and includes support for new computer models.

Published Date: Oct 7, 2016

Macintosh Manager: How to Move Macintosh Manager Between Servers

Follow these steps to migrate Macintosh Manager services from one server to another while retaining all Macintosh Manager data and user documents.
This article has been archived and is no longer updated by Apple.

Steps for Moving Macintosh Manager Services

Note: Some steps give different directions for AppleShare IP and Mac OS X Server. Choose your action according to which of the two you are using.

1. Open the Macintosh Manager application from an administration workstation. Choose Export User List from the File menu.

Note: Do not export Groups.

2. Check to see that software is properly installed on the computer that is to become the new Macintosh Manager server.

AppleShare IP: Place the Macintosh Management Server extension in the Extensions Folder and restart the computer.
Mac OS X Server: In the Setup Assistant, be sure to click the checkbox to activate Macintosh Management Server. When you finish the Setup Assistant, you are prompted to restart the computer.

3. Open the Macintosh Manager administration application. When presented with the login dialog, click Change Server. Click to select the new Macintosh Management Server. Log on as an administrator.

Mac OS X Server: You may use "root" access.

4. Choose Import Users from the File menu. In the subsequent dialog box, select the file you exported in Step 1. Afterward, you should have all users listed as they were on the previous server. Quit the Macintosh Manager application.

Important: Step 4 creates entries for users in the Users & Groups Database (AppleShare IP) or the local NetInfo Database (Mac OS X Server). Skipping this step may cause you to encounter issues later with duplicating or deleting a user.

5. Copy the complete contents of the Macintosh Manager shared folder from the previous Macintosh Manager server to the same location on the new Macintosh Manager server, replacing any existing items.

6. For the Macintosh Manager shared folder on the new server, copy the AppleShare privileges to all enclosed folders.

AppleShare IP: Use the Mac OS Server Admin to perform this step.
Mac OS X Server: You may use Web-based administration to perform this step.

7. Wait for the server to reassign privileges, which may take a few moments.

8. Open the Macintosh Manager application. Log on to the new server and verify that all users, workgroups, and other Macintosh Manager settings have moved successfully.

Note: Be sure to verify the location of each workgroup's documents volume by clicking on the Workgroups tab and Options pane.

Published Date: Feb 17, 2012

Mac OS 9.1: Third-Party OHCI USB Cards Automatically Supported

Mac OS 9.1 includes USB Support 1.4.4, which provides support for third-party OHCI-compliant cards.
This article has been archived and is no longer updated by Apple.
The Mac OS 9.1 Installer installs USB Support 1.4.4 if it detects an OHCI-compliant USB card. The USB OHCI (Open Host Controller Interface) is an industry standard for defining how manufacturers may create a USB controller for the PCI bus.

USB Support 1.4.4 should allow a compliant device to work without additional software. However, if a third-party manufacturer provides additional software, you should consult the third-party's support materials to determine which course of action is best for your system configuration.
Published Date: Feb 17, 2012

Mac OS 9.1 and Later: "Reconnect to servers on wakeup" Feature Removed

The "Reconnect to servers on wakeup" feature has been removed from the Advanced Settings pane of the Energy Saver control panel in Mac OS 9.1 and later. If desired, you may use the workaround described in this article.
This article has been archived and is no longer updated by Apple.

Symptom

When you choose Sleep from the Special menu an alert box with this message appears:

> "Putting the computer to sleep will cause you to lose some network services, including file servers. Check your connections in the Chooser next time you wake the Macintosh."

When the computer wakes up:

- The previously available servers are no longer on the desktop.
- An alert box with this message appears: "File server's connection unexpectedly closed"
- An AppleShare Server Messages log appears on the desktop.

You must then reconnect to the server(s) that were available before sleep.

Note: This issue should only occur on the computers listed below.

Macintosh Manager

Macintosh Manager clients disconnected while logged on to their server cannot reconnect upon waking.

Important: Customers who encounter this issue may lose unsaved changes to work, since the Macintosh Manager client is not connected to the Documents volume in this situation.

Solution

The best time to put a Macintosh Manager client computer to sleep is when it is logged off, not during a Macintosh Manager session.

As a workaround, administrators may set the option to automatically log out idle users. To locate this feature in the Macintosh Manager admin application, click the Computers tab then look in the Security pane.

Important: For this workaround to have the desired effect, the time value set in Macintosh Manager for idle users must be less than what has been defined in the client computer's individual Energy Saver control panels for "Put the system to sleep whenever it's inactive for."

You should only set Macintosh Manager to log out the idle users, not to lock the screen.

Notes

1. The parenthetical product description (Summer 2000) refers to the summer of the Northern Hemisphere.

Published Date: Feb 17, 2012

Disc Burner 1.0.1: Does Not Work With Macintosh Manager or Multiple Users

Disc Burner 1.0.1 or earlier does not work in a Macintosh Manager or Multiple Users environment.

This article has been archived and is no longer updated by Apple.

Symptom

When a user in the Macintosh Manager or Multiple Users environment tries to burn a disc with Disc Burner, this alert message appears:

> "Disk initialization failed because the startup disk is full!"

Solution

This known limitation is documented in the Disc Burner 1.0.1 read me file. See technical document 75106, "**Disc Burner 1.0.1 Document and Software**".

Published Date: Feb 18, 2012

AirPort: Unable to Access Other Computers After Joining Computer-to-Computer Network

If you enter an incorrect password when joining a Computer-to-Computer network, you cannot access other computers but may not see any alert message notifying you of the mistake.
This article has been archived and is no longer updated by Apple.

Symptom

You appear to successfully join a Computer-to-Computer network but are unable to access other computers.

Solution

Reconnect to the Computer-to-Computer network with the correct password.

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

Published Date: Feb 19, 2012

AirPort 1.3 or Later: AirPort Base Station Software File Relocated

The file "AirPort Base Station Software," visible in the Base Station Extras folder in earlier versions of AirPort software, has been incorporated into other files.
This article has been archived and is no longer updated by Apple.
The Base Station Extras folder on the AirPort disc no longer includes a separate file for AirPort Base Station Software.

Rather than opening this file directly, you may get the same effect by using the AirPort Admin Utility or the AirPort Setup Assistant. Either of these applications prompts you to update the software on your base station when it is using an earlier version.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"
Published Date: Feb 20, 2012

AirPort 1.3: PPPoE - Software Base Station Does Not Connect to Internet as Expected

A computer acting as an AirPort software base station and its AirPort client computers may not connect to the Internet via PPP over Ethernet (PPPoE) as expected when the PPPoE connection is not made prior to setting up the software base station.
This article has been archived and is no longer updated by Apple.

Symptom

AirPort client computers cannot connect to the Internet through the software base station and may obtain unroutable 169.x.x.x IP addresses. The computer acting as software base station also may not be able to connect to the Internet.

Solution

1. Connect to the Internet using PPPoE software provided by your Internet service provider.
2. Check to be sure that the Internet connection is active using a Web browser or other Internet application.
3. With the Internet connection still active, open the AirPort Setup Assistant and set up the software base station.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access".**

Macintosh Manager: How to Set up Kid Pix Studio Deluxe for Mac OS 9.x Workstations

Follow these steps to set up The Learning Company's Kid Pix Studio Deluxe so it will work in a Macintosh Manager or Multiple Users environment.
This article has been archived and is no longer updated by Apple.
Note: This document contains information on how the setup and installation of a third-party product is affected by the Macintosh Manager environment. Please contact the vendor for any support information not covered by this document.

Document 17159: "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Setting up the Client Workstation

1. Install Kid Pix Studio Deluxe from its CD-ROM disc.

2. If you have not created an Other Applications· folder on the workstation, do so as described software download document 25280: "**Macintosh Manager 1.4.1: Document and Software**"

3. Place the entire Kid Pix Studio Deluxe folder into the Other Applications· folder.

If the Workgroup Items is set to "Members can open any items on local volumes," then setup is complete. Otherwise, follow the steps below.

Setting up the Macintosh Manager Admin Application

1. Open the Macintosh Manager admin application.

2. Click the Workgroups tab.

3. Click the Items tab. If the radio button for "Members can open any items on local volumes" is selected, then you can stop here. If you use the option to "Restrict members to Selected Items below," then continue to Step 4.

4. From the list of Workgroups, select those that you want to be able to use Kid Pix Studio Deluxe.

5. Add the following applications to the Approved Items list:

- Digital Puppets
- Kid Pix
- Kid Pix Studio Deluxe
- Moopies
- SlideShow
- Stampimator
- WackyTVTM

Figure 1 Adding approved items

Important: To use Digital Puppets, the Kid Pix Studio Deluxe CD must be in the workstation's CD-ROM drive.

Mac OS 8.6 and Earlier Clients

The process for setting up the workstation is not necessary for Mac OS 8.6 or earlier.
Published Date: Feb 17, 2012

Mac OS X10.0: Computer With SCSI Chain Does Not Start up or Stops Responding

A computer running Mac OS X may not start up or may stop responding if the SCSI chain is improperly terminated.
This article has been archived and is no longer updated by Apple.

Symptom

The computer does not start up, or stops responding. The mouse pointer may appear as a spinning disc, and the computer may appear unresponsive.

Solution

This is the result of an improperly terminated SCSI chain. Verify that all SCSI chains are terminated at both ends. This includes terminating any SCSI card that is the last device in the chain.

Note: A SCSI chain that worked with Mac OS 9 may not work with Mac OS X. Mac OS 9 is more tolerant of improper termination than Mac OS X. A properly terminated SCSI chain should perform better, regardless of the version of the Mac OS.
Published Date: Feb 17, 2012

Mac OS X: About Show Info, Get Info, and the Inspector

This article has been archived and is no longer updated by Apple.

This document describes the behavior of the Info, or Inspector, window in various versions of Mac OS X.

The behavior of the Info window has varied throughout different versions of Mac OS X. To see the Info window:

1. Click the Finder icon in the Dock.
2. Select an item in the Finder.
3. Choose Get Info or Show Info (whichever appears) from the File menu.

Here is a chronological summary of the behavior:

Mac OS 8 and 9

If you select an item in the Finder and choose Get Info from the File menu, an Info window appears. Additionally, a new Info window appears each time that you select another item and choose Get Info again. Selecting a new item in the Finder does not affect an open Info window. In this manner, you can open multiple windows for side-by-side comparison.

Mac OS X Server 1.0

The Get Info command is replaced by the Inspector command. After opening the Inspector window, choosing a new item in the Finder dynamically updates the information in the same window to match the new item (rather than opening a new window). While this model prevents visual clutter, it requires a workaround (described below) for comparing different items' info side by side.

Mac OS X 10.0 to 10.1.5

The command is renamed to Show Info, but it retains the dynamic, single-window behavior of the Inspector.

Mac OS X 10.2, 10.3

Mac OS X 10.2 offers both behaviors. The name of the command in the File menu returns to Get Info, and the multi-window behavior is like that of Mac OS 8 or 9. But if you prefer the Inspector-like behavior, you may get it by pressing the Command-Option-I key combination instead of using the Get Info command. Another method for accessing the Inspector is to press and hold the Option key while the File menu is open.

Mac OS X 10.4

As in Mac OS X 10.2 and 10.3, when getting information on two-to-ten items at the same time, multiple information windows open. If you wish, you can get results in a single window with the Command-Option-I key combination.

Information windows are resizable in Mac OS X 10.4 and later.

The Spotlight Comments field in Mac OS X 10.4 is the same as the Comments field in earlier Mac OS X releases.

Mac OS X 10.0, 10.1: Capturing multiple Show Info (dynamic) windows

In Mac OS X 10.1.5 or earlier, if you want to see the Show Info window for multiple items, you may use the Grab utility or the Command-Shift-4 key combination (Mac OS X 10.1 only) to make a a screenshot of a selection.

Mac OS X 10.1 directions

Press and hold the Command, Shift, and "4" keys. You will notice that the pointer changes to a cross hair. Drag the cross hair across the portion of the screen you wish to capture in a screenshot. After you release the mouse button, a picture of the selected area appears on your desktop.

Mac OS X 10.1 users may also use the Grab method described for Mac OS X 10.0.

Mac OS X 10.0 to 10.0.4 directions

1. Open the Grab application (~/Applications/Utilities).
2. Choose Selection from the Capture menu.
3. Move the mouse pointer to one corner of the Show Info window.
4. Drag the pointer across the portion of the window you wish to keep on screen.

A new window appears with the image of the window you selected. Grab saves images in the TIFF format. You may choose whether or not to save the Grab images when closing their windows.

Figure 1 Comparing Grab images of Show Info windows

Mac OS X 10.0: Conflict Catcher Requests Registration Information After Using Classic

When alternatively starting up the computer from Mac OS 9.1 and Mac OS X, Conflict Catcher may request registration information.
This article has been archived and is no longer updated by Apple.

Symptom

Conflict Catcher software requests registration information even though you have previously registered the product.

Solution

If you use the Classic environment of Mac OS X and then restart the computer using Mac OS 9.1, Conflict Catcher may request registration information. The symptom may repeat itself the next time you start up the computer from Mac OS X and use the Classic environment. This happens when the same Mac OS 9.1 System Folder is used to start up both the computer and the Classic environment. This is the way that most computers are set up.

Note: Apple recommends contacting the software publisher for the latest information on this issue.

If you partition your hard disk, you may also use a workaround:

1. Make each hard disk partition at least 2 GB.
2. Install Mac OS X and Mac OS 9.1 on one partition, named "Disk A", for example.
3. Install only Mac OS 9.1 on a second partition, named "Disk B", for example.
4. Start up the computer from Disk A. In the Classic pane of the System Preferences application, select Disk A as the Classic startup volume.
5. Install Conflict Catcher on Disk B.
6. Do not install Conflict Catcher on Disk A.

When you want to start up the computer from Mac OS 9.1, select the System Folder on Disk B as the Startup Disk.

Note: This workaround requires that you plan which Classic software you wish to have installed on each disk or on both. Items installed on one System Folder will not be available when the computer is started up from the other System Folder.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

Mac OS X 10.0: No Status Bar for Keyboard Volume Adjustment

Volume adjustments made from a keyboard work, but a graphical representation does not appear on screen.
This article has been archived and is no longer updated by Apple.

Symptom

You can adjust the computer's volume from your keyboard, but a status bar representing the volume level does not appear on screen.

You may expect to see such a status bar if you are accustomed to Mac OS 9.

Solution

Update to Mac OS X 10.1.

For related information, please see:

Article 106213: "**Mac OS X 10.0, iBook, PowerBook: Display Brightness and Volume Keys Do Not Respond**"
Published Date: Feb 17, 2012

Power Macintosh G3 All-In-One: Volume Adjustment Buttons Do Not Work With Mac OS X

The volume adjustment buttons on the front of a Power Macintosh G3 All-In-One computer do not work with Mac OS X.
This article has been archived and is no longer updated by Apple.

Symptom

Pressing the volume adjustment buttons on the front of the computer has no effect on the volume.

Solution

Use the Sound pane of the System Preferences application to adjust volume.
Published Date: Feb 17, 2012

Mac OS X 10.0: Start up From Mac OS 9.1 to Use Apple DVD Player

You must start up the computer using Mac OS 9.1 or later to watch a movie from a DVD-Video disc.
This article has been archived and is no longer updated by Apple.
You must start up the computer using Mac OS 9.1 or later to watch a movie from a DVD-Video disc.

Mac OS X 10.0 does not have a DVD-Video disc playback feature, but you can watch a movie from a DVD-Video disc using Mac OS 9.1 (included as part of Mac OS X 10.0).

Note: If you have updated to Mac OS X 10.1, please stop here and go to technical document 106470: "**Mac OS X 10.1: DVD Player Installed on Compatible Computers**"

Follow these steps to start up the computer using Mac OS 9.1 or later:

1. Choose System Preferences from the Apple Menu.
2. Click the Startup Disk icon.
3. Select the Mac OS 9.1 System Folder.
4. Restart the computer.

To watch a movie

1. Insert the DVD-Video disc.
2. Open Apple DVD Player--which you may locate with Sherlock 2, available in the Apple Menu.
3. Click Play in the Apple DVD Player controller.

Note: Apple DVD Player does not work in the Mac OS X Classic environment.

Mac OS X: Optimizing for Earlier ATI Graphics Accelerators

Movies and 2D graphics perform better at lower color depths when using Power Macintosh computers with earlier ATI graphics chipsets.
This article has been archived and is no longer updated by Apple.

Symptom

QuickTime movies may play with a lower frame rate than expected. Games and other software that utilize hardware graphics acceleration or OpenGL may perform more slowly than expected.

These computers include one of these graphics accelerators:

- ATI RAGE II+
- ATI RAGE IIc
- ATI RAGE Pro
- ATI RAGE Pro Turbo
- ATI RAGE LT Pro
- ATI RAGE Mobility

Solution

Mac OS X 10.1.5 improves support for 2D and QuickTime acceleration for Rage Pro, Rage Pro Turbo and Rage Mobility. See technical document 106888, "**Mac OS X Update 10.1.5: Enhancements and 'Before You Install' Information**".

Lowering the display color bit depth to thousands improves performance of some movies and applications.

1. Choose System Preferences from the Apple Menu.
2. Click Displays .
3. Click the Display tab.
4. Choose Thousands from the Colors pop-up menu.

Use the latest version of Mac OS X for best overall performance and feature set. Further support for the graphic accelerator chipsets listed above is being investigated for a future version of Mac OS X.
Published Date: Feb 17, 2012

Mac OS X: Cannot Connect to AOL in Classic Environment

The America Online application cannot establish a dial-up connection from the Classic environment of Mac OS X 10.0 and later.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to connect to America Online in the Classic environment via a modem, an alert box with this message appears:

> "Unable to communicate with the modem."

Solution

Use the Mac OS X-native version of America Online for best results.

The AOL installer may already be installed on the hard disks of some Apple computers (at /Applications/Installers/). To locate this in a Finder window, just click the Applications button and then look in the Installers folder.

If you need to download the application, or for more information, see: AOL for Mac OS X

Note: This issue does not occur when you have access AOL through an existing Ethernet connection, or if you connect to AOL after having previously made a PPP (dial-up) connection to a different Internet service provider.

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

The following document can help you search for a particular vendor's address and phone number:

Document 17159: "**Locating Vendor Information**"

AirPort 1.3: Service Name Field Provided for PPPoE Internet Access

Some Internet service providers that use PPPoE require you to enter a name in the "Service name" field to make a connection.
This article has been archived and is no longer updated by Apple.
The "Service name" field is visible when you click the Internet tab in the AirPort Admin Utility and set the "Connect using" pop-up menu to "PPP over Ethernet (PPPoE)."

Figure 1 The Service name field

Like the DHCP Client ID used on many networks, the service name is an optional piece of information that Internet service providers may choose to use to control access. When a service name is used, the Internet service provider defines the types of service to which the service name controls access. Most Internet service providers do not require the use of a service name. You should not type anything into this field unless instructed to do so by your Internet service provider. Contact your Internet service provider for any questions about the use of service names on its network.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access".**

Mac OS X 10.0 Mail: Unexpected Changes When Editing a Mail Signature

When editing a signature in Mail, text justification or text color may unexpectedly change.
This article has been archived and is no longer updated by Apple.

Symptom

When editing a signature in Mail, text justification or text color may unexpectedly change after pressing the Return key.

Solution

Select the affected text and reapply the desired formatting.

This issue may be addressed in a future software update.

Published Date: Feb 17, 2012

Mac OS X 10.0 Mail: Rules May Fail With Hundreds of Messages at Once

Select fewer than 256 messages at once if mail rules in Mail do not work.
This article has been archived and is no longer updated by Apple.

Symptom

One or more mail rules may not be applied when you select a large number of messages at once. This may occur when using an IMAP mail server.

Note: This does not occur when mail rules are being applied automatically. This happens when you choose the Apply Rules to Selection command from the Message menu.

Solution

Select fewer than 256 messages at a time when applying mail rules. Larger numbers of messages may work, but this is the suggested amount.

A future version of the Mail application may address this issue.
Published Date: Feb 17, 2012

Mac OS X 10.0: Internal Modem Makes No Sound When Connecting

The internal modem in certain Macintosh computers makes no sound when connecting.
This article has been archived and is no longer updated by Apple.

Symptom

Modem makes no sound when connecting.

Solution

This issue is resolved in Mac OS X 10.1 and later.
Published Date: Feb 17, 2012

Mac OS X: How to log in automatically at startup

This article has been archived and is no longer updated by Apple.

Use these steps to log in automatically when your computer starts up.

Note: The text and images below describe Mac OS X 10.0 to 10.1.5. The action required for Mac OS X 10.2 or later is very similar, except that you use the Accounts preference pane instead of the Login preference pane. In the 10.2 Accounts pane, look for the Set Auto Login button and the checkbox for "Log in automatically as <username>."

Note: This document applies to Mac OS X 10.2.8 or earlier. For information about Mac OS X 10.3.x, see this article; for information about Mac OS X 10.4 or later, see this article.

Where you begin

After using the Mac OS X Setup Assistant, your computer is set up to log in the first user automatically. When you use the Users pane in System Preferences to add a second user, a sheet appears with a message reminding you that automatic login is turned on.

Figure 1 Automatic login reminder in Users pane

Setting up automatic login

1. Choose System Preferences from the Apple Menu.
2. Click the Login icon.
3. Click the Login Window tab.
4. If you are not logged in as an Admin user, click the lock button to make changes. Enter an Admin user's name and password.
5. Click the checkbox to turn on "Automatically log in," or leave it unchecked to turn off this feature.

Figure 2 The Login pane of System Preferences

6. If you checked "Automatically log in," enter the name and password of the user you want to have logged in at system startup time.
7. Click Set. It is normal to hear a system tone.

Important: This option is most appropriate for a computer that has a single user. To get the security and Multiple-Users benefits of Mac OS X, each member of a group of users that shares the same computer should log in with his or her own name and password and log out at the end of the session. This allows Mac OS X to properly separate items such as user documents, application preferences, and email. If a group of users must use the "Automatically log in" option for the convenience of one of its members, then all other members of the group should immediately choose Log Out from the Apple menu and then log back in with their own names and passwords. Be sure to remember the administrator's name and password. Even after the "Automatically log in" option has been enabled, some software installation and system settings still require authentication of the administrator's name and password.

Published Date: Feb 17, 2012

Mac OS: Multiple Users Creates a Desktop Folder for Each User

The file structure of Mac OS X includes a Desktop folder for each user. In Mac OS 9 you may activate this feature in the Multiple Users control panel.

This article has been archived and is no longer updated by Apple.

Multiple Users provides an individual experience

Mac OS 9 and Mac OS X both introduce the concept of Multiple Users to the Macintosh. Having Multiple Users allows the computer owner or administrator to maintain a separate environment for each user, enhancing the privacy and security of the user experience. As part of the Multiple Users concept, a user only sees the contents of his desktop when he logs in.

What is the difference between the "desktop," "Desktop Folder," "Desktop folder," and "Desktop file?"

The term Desktop has several different meanings in the Mac OS, and you can determine the meaning from context. If you aren't familiar with this term, see:

Article 106166: "**Mac OS 9, Mac OS X: Usage of the Term Desktop**"

The desktop in Mac OS 9 and earlier versions

By default, anyone who uses the computer sees the same desktop. Assuming that Macintosh HD is the startup disk, items from the Macintosh HD or from remote volumes placed on the desktop are stored in one invisible Desktop Folder, located here:

> Macintosh HD: Desktop Folder

Figure 1 A Desktop Folder revealed by Sherlock

If you have more than one hard disk or hard disk partition, each disk or partition contains its own invisible Desktop Folder. Items moved from a disk to the desktop reside in that disk's Desktop Folder. That is why items moved from a floppy disk, for example, disappear from the desktop when the floppy disk is ejected. Items from remote volumes are stored in the Desktop Folder of the disk that was the startup volume at the time the item was copied or downloaded to the desktop.

In the default mode, all items in any Desktop Folder appear on the desktop. The Mac OS does not distinguish who is using the computer. Prior to Mac OS 9, this single desktop was the only option available without the use of additional security software.

If you turn on Multiple Users in the Multiple Users control panel, a Desktop Folder is created for each non-owner user when he logs in. They are in this path:

> Macintosh HD:Users:<User Name>:Desktop Folder

Figure 2 Desktop Folder in Multiple Users

The user designated as owner in the Multiple Users control panel continues to have his desktop items stored in the original Desktop Folder located in the root level of the Macintosh HD volume.

The visibility of the owner's Desktop Folder changes in these situations:

- The owner's Desktop Folder becomes visible to some types of non-owner users when they log in, but they cannot open it. When the owner logs in, his Desktop Folder becomes invisible again.
- The Desktop Folder of a remote Macintosh to which you connect via AppleShare becomes visible, allowing you to access items on that computer's desktop.
- The owner's Desktop Folder becomes visible in the Apple Menu when an alias of the Macintosh HD is placed in the Apple Menu with submenus active.
- The Desktop Folder becomes visible when the computer is started up from Mac OS X.

The desktop in Mac OS X

In Mac OS X, a folder named Desktop is in each user's Home folder (or Home directory). As in Mac OS 9, you may drag items to the desktop or save items to the desktop. Any item visible on the desktop when a user is logged in is stored in that user's Desktop folder. If you were logged in as a user named "Maria," then the items she places on the desktop would be stored in a folder at this location:

Mac OS X/Users/maria/Library/Desktop

Figure 3 Desktop folder in Mac OS X

In this example, the hard disk is named Mac OS X. Like Maria, other users of the computer have folders bearing their names inside the Users folder.

Unlike Mac OS 9, the Trash and hard disk volume names do not appear on the desktop. You may drag a hard disk volume from the Finder window to the desktop, which creates an alias of the disk there. However, there is no option to place the Trash on the desktop. There is not an option for all users to see the same desktop.

Behavior of additional disks used with Mac OS X

Items in a Desktop Folder created by previous versions of Mac OS on removable media (such as Iomega Zip, Syquest, or floppy disks), additional hard disks, or hard disk partitions do not appear on the Desktop of Mac OS X. Rather, the Desktop Folder on these volumes appears as a regular folder in the volume. You can choose to have removable media displayed on the desktop or not by choosing that option in the Desktop & Dock Preferences.

For related information, please see:

Article 106167: "**Mac OS X: Open and Save Dialogs Default to a User's Documents Folder**"

Published Date: Feb 19, 2012

Mac OS: Usage of the Term Desktop

In the Mac OS, the term "desktop" has several different meanings, which are explained in this article.
This article has been archived and is no longer updated by Apple.
There are four primary uses of the term "desktop":

- desktop
- Desktop file
- Desktop Folder
- Desktop folder

desktop

This term, normally lowercase, refers to the central work area you see on your computer's screen after it starts up. This is where the desktop pattern or desktop picture defined in the Appearance control panel (Mac OS 9) or Finder preferences (Mac OS X) appears.

Desktop file

If you have ever heard that you need to "rebuild the Desktop," that was a reference to this invisible file that stores information about the contents of your hard disk. To learn about the Desktop file, see:

Article 10182: "**Mac OS: Rebuilding the Desktop File and Icon Recovery**"

Desktop Folder (Mac OS 9 and earlier)

When you leave items on the desktop, they are stored in an invisible folder on the hard disk named Desktop Folder. Items stored in the Desktop Folder exclude the Trash and any disk icons that appear on the desktop. Since you can't see the Desktop Folder, it may help to imagine that the desktop is a folder that is always open on your computer's screen.

If you have more than one hard disk or hard disk partition, the Mac OS creates an invisible Desktop Folder on each disk or partition. This also applies to removable media.

If you turn on the Multiple Users feature of Mac OS 9, there may be more than one Desktop Folder per disk or disk partition.

Desktop folder (Mac OS X)

Each user with an account on a Mac OS X computer has a folder named Desktop in his home directory. The Desktop folder stores items a particular user places on the desktop when logged in to the computer.

Additional information

For more information on where the Desktop Folder is located, who can access its contents, and how its visibility may change, see:

Article 106165: "**Mac OS X, Mac OS 9: Multiple Users Creates a Desktop Folder for Each User**"
Published Date: Feb 17, 2012

Mac OS X 10.0: Classic Does Not Allow Direct Hardware Networking Access

Applications open in the Classic environment of Mac OS X do not have direct access to networking hardware.
This article has been archived and is no longer updated by Apple.

Symptom

Applications that directly access network hardware do not work in Classic. Examples include:

- Network "sniffers" used to capture network traffic
- Modem dialing software

Such an application may report that it cannot find any ports.

Product affected

- Mac OS X 10.0

Solution

When the computer is started up from Mac OS X, you cannot use Mac OS 9 applications in the Classic environment for functions that require direct networking hardware access. Packet capture is one example of a task that requires direct or "raw" access to network hardware. Dial-up modem access is another. Alternatively, you may start up the computer from Mac OS 9.x to use such an application.

Open Transport, AppleTalk, and TCP/IP networking within Classic rely on the networking capability provided by Mac OS X. LocalTalk (AppleTalk over serial ports) does not work in Classic, nor does any software that depends on accessing the network directly through networking hardware. Dial-up access is passed through the Mac OS X application Internet Connect rather than originating within Classic.
Published Date: Feb 17, 2012

Mac OS X 10.0: Num Lock Prevents Dragging in Cocoa Applications

If the Num Lock key is activated while using Mac OS X, you may be unable to drag or arrange items within Cocoa applications.
This article has been archived and is no longer updated by Apple.

Symptom

An item can be selected within an application, such an email message in the Mail application, but you cannot drag or arrange it. This may also be seen in the language list in System Preferences, and potentially other lists in the system.

Note: Software developers may create applications for Mac OS X to run in environments that include Classic, Carbon, and Cocoa. This issue may only affect applications designed for Cocoa.

Solution

Turn off Num Lock. This is done by pressing the Num Lock key while pressing and holding the Shift key.
Published Date: Feb 17, 2012

Mac OS X 10.0 Mail: Requires Cleartext Authentication on IMAP Server

The application Mail cannot authenticate when connecting to an IMAP server if cleartext authentication is disabled.
This article has been archived and is no longer updated by Apple.

Symptom

You cannot get email from an IMAP server.

Solution

Choose one of these two options:

- Client - Use POP3 mail service instead, if available.
- Network Administrator - Enable cleartext authentication on the IMAP server.

Mac OS X 10.0: How to Set Date and Time to ISO 8601:1988 Standard

Follow these steps to set the date and time in Mac OS X to use the ISO 8601:1988 date and time notation standard.

This article has been archived and is no longer updated by Apple.

Follow these steps:

1. Open the System Preferences application.
2. Click International. The International pane appears.
3. Click the Date tab.
4. In the Long Date area, set the pop-up menus to this order:
Weekday
Day
Month
Year
5. Delete the comma in the field next to the Month pop-up menu.
6. Click the checkbox to enable "Leading zero for day".
7. In the Short Date area, choose Year/Month/Day from the pop-up menu.
8. Type a hyphen in the Separator field, and press Tab to update the field.
9. Click the checkboxes to enable "Leading zero for day", "Leading zero for month", and "Show century".

When you have finished these steps, your settings should look like those in Figure 1.

Figure 1 Date tab

10. Click the Time tab.
11. Click 24-Hour clock.
12. Click the checkbox to enable "Use leading zero for hour".

When you have finished these steps, your settings should look like those in Figure 2.

Figure 2 Time tab

13. Quit the System Preferences application.

Classic applications

To use ISO 8601:1988 date and time notation in Classic applications, you must also set the Mac OS 9 Date & Time control panel in the Classic environment. For steps on how to do this, see article 60752: "**Mac OS 9: How to Set Date and Time to ISO 8601:1988 Standard**."

More information
For more information on the ISO 8601:1988 standard, Open Sherlock and search for ISO 8601.

Note: Some applications included with Mac OS X, including Mail, may not use the date and time settings in the System Preferences application.

Published Date: Feb 20, 2012

Mac OS X: Only Use 256 Colors and/or 640 by 480 Resolution When Required by Classic

The 256 color depth setting and the 640 by 480 screen resolution (alone or in combination) should only be used by Classic applications.
This article has been archived and is no longer updated by Apple.

Symptom

Irregularities may appear in system graphics when using either the 256 color depth setting or the 640 by 480 screen resolution. Normally, neither is a choice in the Displays preference panel.

Solution

You should use the 256 color depth setting or the 640 by 480 screen resolution in Mac OS X only when a Classic application prompts you to do so or makes the change automatically. The applications that require these settings should not suffer any graphic anomalies in most cases.

However, when you quit the application that requires one or both of these settings, you should check the Displays pane of the System Preferences application. If the application did not automatically switch the display's settings back to a higher resolution and color depth, you should do so using the menus in the Displays pane.

Note: For convenience, you may select the option to "Show displays in menu bar" in the Displays pane of System Preferences.

Mac OS X 10.2 or Later

If display irregularities persist after resetting the resolution and color depth, use the following solution (requires Mac OS X 10.2 or later):

1. Open System Preferences.
2. Open the Displays preference pane.
3. Select a resolution of at least 800 x 600.
4. Open the Universal Access preference pane.
5. Click the Set Display to Grayscale button.
6. Click the Set Display to Grayscale button again to restore color.

Published Date: Feb 17, 2012

Mac OS X 10.0, Mac OS 9.0.4: Classic Requires Update to Mac OS 9.1 or Later

The Classic environment of Mac OS X does not work with Mac OS 9.0.4 or earlier.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to open a Classic application, an alert box appears as Classic opens with the message:

> "The System file on the selected startup disk is prior to version 9.1 and is not supported by Classic. Please select a different startup disk using the Classic preferences panel and restart Classic"

Figure 1 Starting Classic with Mac OS 9.0.4

You see a similar message when you open the Classic control panel:

> "No Startup Volume. There is no volume with a system folder that supports starting Classic. Please install Mac OS 9.1 or later."

Solution

If you install Mac OS X on a computer that has Mac OS 9.0.4 or earlier installed, you will see a warning telling you that you need Mac OS 9.1 to run Classic.

If you have a reason not to update to Mac OS 9.1, you can use Mac OS 9.0.4 and Mac OS X on the same computer. However, you must also install a Mac OS 9.1 System Folder on the computer and designated it as the Classic startup volume. Because this requires having two Mac OS 9.x System Folders, the most manageable setup would include at least two hard disk partitions.

Published Date: Feb 17, 2012

Mac OS X 10.0: Cannot Open Debugger in Classic

Microbug, the ROM-based debugger, does not work in the Classic environment of Mac OS X. You may open other debuggers in Classic, but not with the programmer's button.
This article has been archived and is no longer updated by Apple.

Symptom

After pressing the Command-Power key combination, or the programmer's button, the Microbug debugger box does not appear in the Classic environment as it would if the computer had been started up from Mac OS 9. The programmer's button is also known as the debugger button or interrupt button.

For further information on Microbug, see article 30556: "**Mac OS: Empty White Box on Screen**"

Solution

Mac OS X does not work with the ROM-based debugger in Classic. To use Microbug, start up the computer in Mac OS 9. To debug Mac OS 9 programs in Classic, use MacsBug or another Classic-compatible third-party debugger. Developers can download MacsBug at:

Apple Developer Connection http://developer.apple.com/tools/debuggers/

MacsBug is a developer tool. As such, technical support for MacsBug is not provided as a part of Apple's normal consumer product support.

Note: Even when using a Classic-compatible debugger, the programmer's button does not work in the Classic environment. To open a debugger in the Classic environment, use the appropriate keyboard command, which is Command-Power on those keyboards that have a Power button, and Command-Eject on those that do not. On some portable machines, you may have to hold down the Command-Eject combination for a moment until the debugger window appears.
Published Date: Feb 17, 2012

Mac OS X 10.0: Using Classic With Tomb Raider, Star Wars: Episode 1 Racer, Myth II

Some early versions of the games Tomb Raider (Eidos Interactive/Aspyr Media), Myth II (Bungie Software) and Star Wars: Episode 1 Racer (LucasArts Entertainment Company) require software updates to work in the Classic environment.
This article has been archived and is no longer updated by Apple.

Symptom

When opening a game an alert box appears with a message that says OpenGL could not load or that not enough memory is free.

Solution

Download and install the appropriate software updates for each game.

Updates for games published by Aspyr Media can be found at:

Aspyr Support http://www.aspyr.com/support/

Updates for games published by LucasArts Entertainment can be found at:

LucasArts Technical Support http://support.lucasarts.com/

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

Mac OS X 10.0: Some Classic Applications Require Installation of System Folder Components

Some applications do not function correctly or at all if required System Folder components are not properly installed, such as extensions or libraries.
This article has been archived and is no longer updated by Apple.

Symptom

A Classic application:

- works but seems to be missing functions
- generates and alert box with a message that extensions or other System Folder components are missing

For example, AppleWorks 5.0.4 works but you cannot check spelling because its System Folder resources are not properly installed.

Solution

This behavior does not differ from versions of the Mac OS prior to Mac OS X 10.0. Any application that uses System Folder items must be properly installed. Use the included application installer or the instructions provided by the software publisher to place these items in the System Folder on the startup volume.

It is important to remember this necessity when the computer has more than one potential Mac OS 9 startup volume. Consider this set of circumstances and events:

1. A hard disk has two partitions, named "Disk A" and "Disk B."
2. Both partitions contain Mac OS 9 system folders.
3. Disk A is the designated Classic startup volume in System Preferences.
4. AppleWorks 5.0.4 is installed while Classic is started up from Disk A.
5. AppleWorks 5.0.4 successfully performs spell checking.
6. The Classic startup volume is changed to Disk B.
7. When Classic restarts from Disk B, AppleWorks cannot check spelling.

In this example, you would repeat the AppleWorks 5.0.4 installation process to establish proper operation when started up from either System Folder.

Note: When using an application started up alternatively from different System Folders, you will have separate preferences stored in each System Folder. If, in the example above, you restarted Classic from Disk A after using AppleWorks while started up from Disk B, your AppleWorks preferences would be just as you left them the last time you used it while started up from Disk A.

Applications that require special hardware access may not work in the Classic environment even when properly installed. See article 106184: "**Mac OS X 10.0: Access Not Provided in Classic for Certain Hardware-Oriented Applications**."
Published Date: Feb 17, 2012

Mac OS X 10.0: Access Not Provided in Classic for Certain Hardware-Oriented Applications

Some applications that require special hardware access, such as the AppleCD Audio Player and the Apple DVD Player, do not work in Classic. This article has been archived and is no longer updated by Apple.

Symptom

Applications that require direct hardware access may not work in the Classic environment. An alert box may appear when you open the application that suggests you need to add extensions to the System Folder.

Solution

You should update to the latest version of Mac OS X for best compatibility. Mac OS X 10.1 and later include DVD playback on compatible computers.

Some applications that require special hardware access do not work in the Classic environment of Mac OS X 10.0.

In order to perform the desired function, the appropriate Mac OS X application must be used. For example, use iTunes to listen to an audio CD.

Mac OS X 10.0 does not have a DVD player application. To watch a movie from a DVD-Video disc, restart the computer from Mac OS 9.x and use the Apple DVD Player application. For related information, please see technical documents:

106153: "**Mac OS X 10.0: Start Up from Mac OS 9.1 to Use Apple DVD Player**"
106470: "**Mac OS X 10.1: DVD Player 3.0 Installed on Compatible Computers**"

Mac OS X: Copy and Paste Between Classic and Mac OS X Applications

The Clipboard may take a few seconds to synchronize when copying from a Classic application to a Mac OS X application.
This article has been archived and is no longer updated by Apple.

Symptom

If you paste before the Clipboard has synchronized from the Classic environment to the Mac OS X environment, the pasted data may not be what is expected.

Solution

Update to Mac OS X 10.1.2 or later. Use the Software Update pane in System Preferences, or download the update from Apple Software Downloads (http://www.apple.com/swupdates/).

Note: If your copying does not complete (spinning cursor and system is unresponsive) see document number 106669 "**Mac OS X 10.1.2: Spinning Disc Cursor When Copying/Pasting From Classic**."
Published Date: Feb 17, 2012

Mac OS X 10.0: Startup Sound Persists With Volume Muted

Muting the system volume does not silence the startup sound (or "chime").
This article has been archived and is no longer updated by Apple.

Symptom

After setting system volume to mute, you still hear the startup sound.

Solution

A future update to Mac OS X may permit the startup sound to be muted along with the system volume.
Published Date: Feb 17, 2012

Mac OS X 10.0: Epson SC 740 Printer Error -27 Message

When a document is still printing from a Classic application and a second (queued) document is sent to print, the second job may fail.
This article has been archived and is no longer updated by Apple.

Symptom

A queued print job fails to print, and an alert box appears with a -27 error code.

Solution

Contact Epson for information on a permanent solution to this issue. However, there are two workarounds:

1. Wait until the first Classic print job is complete before printing the second job.

2. Send the second print job again after the error message appears.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

The following article can help you search for a particular vendor's address and phone number:

Article 17159: "**Locating Vendor Information**"

Mac OS X Mail: Plain Text Compared to Rich Text (RTF)

Mail can send text or rich text format messages, but not all recipients can read rich text (RTF).
This article has been archived and is no longer updated by Apple.

Symptom

Some of your email recipients cannot read the messages you send, or do not see text formatting the way you do.

Solution

You can compose email in either plain text (.txt) or rich text format (RTF).

Plain text (.txt)

- Can be read by anyone, regardless of the email application they use.
- Does not offer text formatting options.
- Can have pictures or graphics attached, but not inset.

Rich text format (.rtf)

- Allows you to format a message for font, justification, stylized text and other options.
- Pictures or graphics can be inset.
- Cannot be read by every type of email application.

Choosing a format

Mail defaults to rich text so that you can take advantage of its formatting choices. You may change the default behavior by using these steps:

1. Choose Preferences from the Mail application menu.
2. Click the Composing icon.
3. Choose the format you desire from the "Default message format" pop-up menu.
4. Close the Mail Preferences window.

To automatically reply to messages in the format used by a sender, check "Use the same format as original message" in the Composing pane of Mail Preferences.

Changing format on the fly

If you want to send a message that is not in your preferred format, you may do so without changing the preferences back and forth. After you click Compose for a new message, choose the alternate format from the Format menu.

Mac OS X 10.0: Performance Slower When Sherlock Updates or Creates an Index

Mac OS X may seem less responsive when Sherlock is indexing.

This article has been archived and is no longer updated by Apple.

Symptom

With a Sherlock window open and volume indexing in progress, Mac OS X or the Classic environment may seem less responsive.

Solution

Turn off Sherlock indexing:

1. Choose Preferences from the Sherlock application menu.
2. Click the two Indexing Options checkboxes to turn them off.
3. Click OK.

Note: Indexed volumes provide an enhanced Sherlock experience. You should turn indexing back on at a later time or choose Index Now from the Find menu.

Published Date: Feb 20, 2012

Mac OS X 10.0: Startup Volume Is Named "/" Instead of "Mac OS X"

When Mac OS X is installed on a UNIX File System (UFS) volume, the startup volume is named "/."
This article has been archived and is no longer updated by Apple.

Symptom

The computer's startup volume is named "/" instead of "Mac OS X" when Mac OS X is installed on a UFS volume. The volume's name may be changed, but that change is lost after a restart.

Solution

This is the expected behavior when installing onto a UFS volume. This does not affect the operation of Mac OS X. When referring to a file by a pathname, substitute "/" in place of the leading "/Mac OS X/."

To avoid this behavior, install Mac OS X on to a Mac OS Extended (HFS Plus) volume.

A future update to Mac OS X may allow for a customizable UFS volume name.
Published Date: Feb 17, 2012

Mac OS X 10.0: Setting up an AirPort Base Station Requires Restart from Mac OS 9

Restart your computer from Mac OS 9 to set up or administer an AirPort Base Station.
This article has been archived and is no longer updated by Apple.

Symptom

The AirPort software in Mac OS X 10.0 allows you to connect to an AirPort network, but it does not include the ability to administer a base station.

If you attempt to use AirPort software in Classic without restarting, you may see an alert box with this message:

> "That application or control panel is not supported by Classic."

Figure 1 Attempting AirPort use in Classic

Notes

1. This alert box may not appear if you have the latest AirPort software installed in Mac OS 9. However, you should still restart your computer.
2. While started up from Mac OS 9, you should download and install the latest version of AirPort software from Apple Software Updates (http://www.apple.com/swupdates/).

Solution

Updating to Mac OS X 10.1 will allow you to administer an AirPort Base Station from within Mac OS X. If you do not yet have Mac OS X 10.1, you may do so by following these steps:

1. Choose System Preferences from the Apple menu.
2. Click Startup Disk.
3. Click an Mac OS 9 System Folder.
4. Restart the computer.

After you've administered your AirPort Base Station in Mac OS 9, you can use the Startup Disk control panel to select your Mac OS X System Folder.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access".**

Published Date: Feb 17, 2012

Mac OS X 10.0, Sherlock: Closing Versus Quitting Applications and Control Panels

Some applications do not quit automatically when closed as they did in Mac OS 9.x.
This article has been archived and is no longer updated by Apple.

Mac OS 9.x and earlier

In versions of the Mac OS prior to Mac OS X, control panels automatically quit when you closed them. They did not behave the way other applications in Mac OS 9.x and earlier did, which was to remain open until explicitly quit. Sherlock behaved as a control panel in this respect.

Mac OS X 10.0 and later

With Mac OS X, both control panels and Sherlock behave as normal applications.

Each Mac OS X control panel is contained as a "pane" in the System Preferences application. If you open the System Preferences application and close the System Preferences window, System Preferences does not quit. The Dock indicates that the System Preferences application is still open by showing a triangle underneath the application icon.

To get a new window for an application, click its icon in the Dock.
Note: This does not apply to applications such as the Grab utility, which do not show a window when opened.

Quitting an open application

Select the application in the Dock and choose Quit from the application menu. You may alternatively use the Command-Q key combination.

Monitoring system usage

Open applications continue to use memory and system resources until you explicitly quit them. Though an application that is open but not being used generally consumes very few system resources, you should be aware that some applications may be performing significant tasks when not in the foreground. How can you tell the difference? You may use the Process Viewer utility to see the percentage of CPU time and memory being used by an application.

Note: It is normal to see processes in the Process Viewer that do not appear as applications in the Dock. Most of these are components of the operating system.
Published Date: Feb 17, 2012

Mac OS X: Use Roman Characters Names on Mac OS Standard (HFS) Volumes

Japanese characters cannot be used for file or folder names on a Mac OS Standard (HFS) formatted volume.
This article has been archived and is no longer updated by Apple.

Symptom

When using Japanese characters to rename a file or folder located on a Mac OS Standard (HFS) volume, you may see an alert with a message such as this:

> "The name Konichiwa cannot be used. Try using another name, with fewer characters, or no punctuation marks."

Note: In the alert message, "Konichiwa" would appear in Japanese characters.

If you copy an existing folder or file with Japanese characters to a Mac OS Standard volume, you will see an alert box with this message:

> "Sorry, the operation could not be completed because an unexpected error occurred (Error code -50)"

Figure 1 Alert dialog

Solution

Mac OS Extended (HFS Plus) format improves efficiency over the earlier Mac OS Standard (HFS) format, but some situations may require you to continue using HFS. An example of such a situation is when the volume in question must be capable of starting up a computer with system software earlier than Mac OS 8.1.

If the volume you are using must be HFS format, then use Roman characters for folder names.

To copy an existing file with Japanese characters in the filename to an HFS volume, you must rename the item. In the case of a folder you could copy the contents of the folder to a new folder on the Mac OS Standard format hard drive.

To use Japanese characters in a folder name instead of Roman characters the drive must be reformatted using HFS Plus with the Disk Utility or Drive Setup applications.

Note: This will affect also other double-byte languages including Chinese and Korean.

- 106553 "**Mac OS X: Using Double-Byte Characters**"

Published Date: Feb 17, 2012

Mac OS X 10.0 Mail: Mailbox Locked Alert

Sometimes an alert box appears with a message that the mailbox is locked. This can happen if the application Mail did not properly quit or the network connection changed.
This article has been archived and is no longer updated by Apple.

Symptom

When opening the application Mail, you may get an alert box with a message like this:

> "The mailbox ~/Library/Mail/Mailboxes/INBOX.mbox is currently locked by username on host myhost.com. If you open a mailbox that is already in use, you may damage its contents."

Notes

1. The exact message varies depending on the name of the Mail user and the host name.
2. The tilde (~) represents a user's Home directory.

A dialog box offers three choices:

- Open Read Only
- Quit
- Open Anyway

Solution

Update to Mac OS X 10.1 or later.

There are three reasons why this alert could occur.

Application did not quit properly

If the application Mail stopped responding or quit unexpectedly during its last use, it may not have been able to properly close the files. It is safe to click Open Anyway in this case.

Changing network connection

This alert could occur if you change networks while Mail is open. Some examples include:

- Disconnecting from an Ethernet network and connecting to an AirPort network.
- Changing from Ethernet to dial-up PPP.
- Changing the configuration of an Ethernet connection (static IP to DHCP, for example).

In these cases it is also safe to click Open Anyway.

Multiple accounts in Personal Mailboxes

This issue can happen when:

- Two or more mail accounts are set to deposit messages in the Personal Mailboxes Inbox.
- Messages from two or more accounts are subsequently written to the Inbox at the same time.

To work around this, you either create a separate Inbox for each account or check your accounts individually.

Note: The first workaround is only available for POP accounts. IMAP accounts automatically have a separate Inbox. A Mac.com account may be set up as either POP or IMAP.

Follow these steps to create separate Inboxes:

1. Choose Preferences from the Mail application menu.

2. Click to select the name of an account in the Description column of the Mail Preferences window.
3. Click Edit.
4. Click the Account Options tab.
5. Click the radio button to enable the "Show this account separately in mailboxes drawer" option.
6. Click OK.

To check your accounts individually, choose Get New Mail In Account from the Mailbox menu. You also need to set your accounts to check mail manually. To do that:

1. Choose Preferences from the Mail application menu.
2. Choose Manually from the Check accounts for new mail pop-up menu.

Published Date: Feb 17, 2012

Mac OS X 10.0: Mail May Interrupt Log Out

Sometimes the application Mail in Mac OS X interrupts Log Out.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box appears with the message:

> "Logout has timed out because the application Mail failed to quit. To try again, quit Mail and choose Log Out from the Apple menu."

Figure 1 Mail failed to quit message

This happens if you choose Log Out from the Apple menu with the Mail application still open.

Solution

Quit Mail prior to logging out.

Sometimes Mail takes longer than expected to quit, a known behavior for this release of Mail. It does not indicate an issue. This may be addressed in a future software version.
Published Date: Feb 17, 2012

Mac OS X 10.0: Cannot Have Two Open Versions of Microsoft Internet Explorer

You cannot use Internet Explorer 5.1 for Mac OS X at the same time as Internet Explorer 4.x or 5.0x in Classic.
This article has been archived and is no longer updated by Apple.

Symptom

A second version of Internet Explorer will not open when a different version is already open.

Solution

Quit Internet Explorer before attempting to open a different version.
Published Date: Feb 17, 2012

Mac OS X 10.0: Use Command Key to Select Multiple Items in List and Column Views

The behavior of the Shift key when used to make a selection in the Finder has changed between Mac OS 9 and Mac OS X.
This article has been archived and is no longer updated by Apple.

Symptom

Holding down the Shift key while you click in List view selects the first and second items, and all items in between.

Solution

Press the Command key before clicking to select multiple noncontiguous items in Mac OS X for List and Column views. (In Mac OS 9 and earlier, pressing the Shift key while in List view allowed you to select multiple noncontiguous items.)

Behavior in Icon view remains the same in both operating systems.
Published Date: Feb 17, 2012

Mac OS X 10.0: Cannot Make Alias of Hard Disk Volume in Computers Directory

The Make Alias command in the File menu appears dimmed or unavailable when a hard disk or other volume is selected in the Computers directory.

This article has been archived and is no longer updated by Apple.

Symptom

You are unable to make aliases of volumes in the Computers directory.

Solution

Because users do not have write privileges to the Computers directory, the Make Alias command is not available. To make an alias to a volume that appears in the Computers directory, drag a volume's icon into an area to which you have write privileges, such as the desktop or the Favorites folder. Since a volume cannot be removed from the Computers directory, an alias is automatically created in the new location.

Published Date: Feb 17, 2012

Mac OS X: How to Use Pop-Up, Hierarchical Menus in the Dock

Dragging a folder or disk to the Dock provides a hierarchical pop-up menu.
This article has been archived and is no longer updated by Apple.
A pop-up menu in the Dock offers you the same type of hierarchical submenu structure that was available in the Apple menu of Mac OS 9 and earlier. To create a pop-up menu in the Dock, simply drag a disk or folder icon into the Dock, between the dividing line and the Trash. Disks and folders in the Dock must be placed to the right of or below the divider.

A disk or folder in the Dock reacts two ways:

1. When clicked, the item opens in a Finder window.
2. When Control-clicked, a pop-up menu with submenus appears. With a disk or folder in the Dock, you can use submenus to navigate through folders to a file.

Figure 1 Navigating a disk from the Dock
Published Date: Feb 17, 2012

Mac OS X 10.0, 10.1, 10.2: List View Settings May Not Be Retained

Finder windows in the List view may not retain proper settings on subsequent viewings.
This article has been archived and is no longer updated by Apple.

Symptom

A Finder window viewed as a list may fail to retain a custom view or sort order (such as viewing by Date Modified) after the window is closed and reopened.

Solution

As new information becomes available, this document will be updated.

106893 Mac OS X: Icons Appear Stacked Upon Each Other, Cannot Be Moved

Published Date: Feb 17, 2012

Mac OS X 10.0: "Can‘t index" Appears in Sherlock Window

Mac OS X allows you to index only the portion of the file system to which you have read-write access.
This article has been archived and is no longer updated by Apple.

Symptom

"Can't index" appears in the Index Status column of the Sherlock window.

Solution

This is the correct behavior for Mac OS X. As a multi-user operating system, Mac OS X enhances privacy and file system integrity by allowing each user to access only specific areas of the file system. Sherlock can only index folders or volumes to which you have complete access. By default, this includes your Home directory, and it may include other volumes, such as an external hard drive, to which you have write access. Sherlock cannot access volumes to which you do not have complete access, such as the Mac OS X startup disk, or to read-only volumes such as CD-ROMs.

Your Home directory should appear in the Sherlock window with a status of "Indexed". Volumes and folders which cannot be indexed will appear with a status note explaining why they cannot be indexed.
Published Date: Feb 17, 2012

Mac OS X 10.0: Submenus Not Provided for Folder Aliases in the Dock

Aliases in Dock pop-up menus do not create submenus as expected.
This article has been archived and is no longer updated by Apple.

Symptom

- You place a folder or disk which contains aliases in the Dock.
- When you Control-click that folder or disk in the Dock, the aliases in the pop-up menu do not create submenus as expected.

Figure 1

The availability of a submenu is noted by a gray triangle next to a folder in a pop-up menu. Note that the original "untitled folder" has the triangle, but its alias does not (Figure 1).

Solution

This is expected behavior for Mac OS X 10.0.
Published Date: Feb 19, 2012

Mac OS X 10.0: Message That "There are no view options for the desktop" Appears

Though View Options exist for the desktop, you may find a message that leads you to believe otherwise.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to customize the desktop, you may:

1. Close all Finder windows.
2. Click the desktop.
3. Choose the Show View Options from the View menu.

Then you see this message in the Window pane:

"There are no view options for the desktop."

The Finder Preferences window contains all the settings you would expect to find in View Options:

- Icon Size
- Icon Arrangements
- Show Disks on Desktop

Additionally, Finder Preferences allows you to select the Desktop Picture.

Apple may address the "no view options" message in a future software update.

Mac OS X 10.0: The Capture Window Command Does Not Work in the Grab Utility

The Window command in the Capture menu remains dimmed (unavailable) and does not work in Mac OS X 10.0.
This article has been archived and is no longer updated by Apple.

Symptom

The Window command in the Capture menu of Grab appears dimmed or unavailable.

Figure 1 Window command dimmed

Solution

The Window command does not work. You may use this workaround:

1. Choose the Timed Screen command from the Capture menu.
2. Click Start Timer.
3. Arrange windows or menus for your screen shot.
4. Save the resulting image file.
5. Use an image editor application to crop the picture as you wish.

Published Date: Feb 19, 2012

Mac OS X 10.0: Using the Command-Option-Drag Key Combination

Using Command-Option-Drag forces an application to attempt to open a file that it normally does not recognize.
This article has been archived and is no longer updated by Apple.

Symptom

When you drag a file over an application icon, the application does not open the file.

Solution

By using Command-Option-Drag, you force the application to attempt to open the file. This feature is not intended for any one situation, but here is one example:

1. Locate a PICT file (such as created by a Shift-Command-3 screen shot in Mac OS 9.x).
2. Drag the PICT file over the Internet Explorer icon in the Finder or Dock.
3. Note that the Internet Explorer icon does not darken, indicating that Internet Explorer does not recognize the PICT as a file that it would normally open.

Figure 1 PICT file not recognized by Internet Explorer

4. Press and hold the Command (Apple) and Option keys.
5. Drag the PICT file over the Internet Explorer again.
6. When the Internet Explorer icon darkens, release the mouse button.

Figure 2 Command-Option-Drag forces recognition

The PICT file opens in Internet Explorer.

Note: Command-Option-Drag never guarantees a file will open as expected or at all. In this example, Internet Explorer uses QuickTime support to display the PICT file. No application can be forced to correctly handle a file type for which it was not designed. You may achieve varying degrees of success using this technique.

Mac OS: "Unable to establish a secure connection" or "can‘t verify identity" messages in Web browsers

This article has been archived and is no longer updated by Apple.

Your Web browser software relies on correct date and time settings to make secure connections to the Internet.

If the date and time are not correct, an alert box may appear with a message such as "unable to establish a secure connection" or "can't verify identity." The exact words vary with different Web browsers, but it might look like this message from Safari:

There could also be other causes. To avoid this issue, follow these steps:

1. Be sure that your Date & Time control panel settings are correct.
2. Try a different Web browser.
3. Download the latest versions of your Web browsers.
4. If you still cannot make a secure connection, notify the contact listed on the affected Web site.
5. In Mac OS X 10.3, 10.4 or later, you can use Keychain First Aid to resolve potential keychain issues.

Why Date and Time?

A common cause for this issue is incorrect Date & Time settings. Some Web sites use encryption to protect your data while in transit, particularly when making purchases, financial transactions, or conveying other sensitive information. To be sure that only "trusted" Web sites can make a secure connection to your computer, the Web browser queries the site for a valid security certificate. Because certificates are issued and expired like a driver's license, your Web browser perceives that a proper certificate is invalid if your computer is set to a date outside the range of the certificate.

Mac OS X: How to Set Up TextEdit as an HTML or Plain Text Editor

TextEdit renders HTML by default. You may change its preferences to act as a plain text editor, for use in editing HTML or configuration files, for example.

This article has been archived and is no longer updated by Apple.

Symptom

You expect TextEdit to open your HTML file in plain text form for editing, but it renders the file into its consumable form.

Solution

1. Open TextEdit.
2. Choose Preferences from the TextEdit application menu.
3. Click the Plain Text radio button for New Document Format.
4. Under Saving, click the checkbox to turn off "Append '.txt' extension to plain text files."
5. Under Rich text processing, click the checkbox to turn on "Ignore rich text commands in HTML files."
6. Be sure the checkbox for "Wrap to Page" is deselected (Figure 1).

Figure 1 Correct TextEdit Preferences for configuration file editing

Notes

1. Any data in TextEdit prior to taking these steps may contain rich text commands that become visible after the preference changes are made.

2. TextEdit may continue to render files saved from Web browsers as HTML Source, ignoring the preferences you have set. As a workaround (after following the steps above) view the source code in the Web browser and copy/paste the text into a new TextEdit document.

Mac OS X 10.0, iBook, PowerBook: Display Brightness and Volume Keys Do Not Respond

On most PowerBook and iBook computers, display brightness and volume keys do not work with Mac OS X 10.0.
This article has been archived and is no longer updated by Apple.

Symptom

You press a function key (or dedicated button on some models), and the expected adjustment to display brightness or volume does not occur.

Note: The behavior of affected computers varies. On the PowerBook G4, for example, you may adjust volume using the keyboard but not display brightness. Other computers, such as the PowerBook (FireWire), may not be able to use either display or volume keys.

Solution

Update to Mac OS X 10.1. Otherwise, you may:

1. Choose System Preferences from the Apple menu.
2. Use the Displays and Sound panes in System Preferences to make the desired adjustments.

For related information, please see:

Article 106150: "**Mac OS X 10.0: No Status Bar for Keyboard Volume Adjustment**"
Published Date: Oct 7, 2016

Mac OS X 10.0: "file system dirty, run fsck"

Certain file system issues may prevent the computer from starting up to a normal state, causing this message to appear: "file system dirty, run fsck". The fsck utility may be able to verify and repair a Mac OS X disk when this happens.
This article has been archived and is no longer updated by Apple.

Symptom

The computer starts up in a command-line (text only) environment and displays this message:

> "file system dirty, run fsck"

Solution

Use the fsck utility to check and repair the disk. For instructions on using the fsck utility, see article 106214: "**Mac OS X 10.0: Why, When, and How to Run fsck for File System Maintenance**".
Published Date: Oct 11, 2016

Mac OS X, Portables: Batteries shouldn‘t be changed when computer is sleeping

This article has been archived and is no longer updated by Apple.

Attempting to change a battery while the some portable computers are asleep (and started up from Mac OS X) causes an NVRAM and/or Power Manager reset. Connect the AC power adapter before swapping the battery, or shut the computer down instead.

If you try to change the portable computer's battery while it is asleep and not connected to the AC power adapter, these things might happen:

- Your computer shuts down.
- The system clock, Startup Disk, and other PRAM/NVRAM settings reset to default.
- Your computer restarts from the first available volume, when more than one is present.
- You may not be able to make secure connections in a Web browser (because the date isn't correct).

Important: You should not do this kind of reset unnecessarily. A variety of system settings return to default after this type of reset.

This document applies to these portable computers:

- PowerBook G3 Series
- PowerBook G3 Series (Bronze Keyboard)
- PowerBook (FireWire)
- PowerBook G4
- PowerBook G4 (12-inch) (all)
- iBook (all)

Solution

Connect to your AC power adapter, or shut the computer down to change batteries.

Be sure to use System Preferences to reselect your Startup Disk and to correct date and time. If your computer starts back up from Mac OS 9.x, use the Startup Disk control panel to select the Mac OS X System Folder.

Mac OS X 10.0, PowerBook: Shut Down to Switch Monitors

Mac OS X 10.0 does not allow PowerBook users to switch between the built-in display and an external monitor while sleeping.
This article has been archived and is no longer updated by Apple.

Symptom

You hear the PowerBook wake up, but it has no video.

Solution

When started up from Mac OS 9.x, PowerBook users can switch between an external monitor and the built-in display by putting the computer to sleep, connecting or disconnecting the display cable (VGA), and waking the computer up.

If you attempt the same in Mac OS X 10.0, the computer wakes up without video. When this happens, you can shut your computer down normally without video by following these steps:

1. Press the Power button.
2. Wait a few seconds.
3. Press the Return key.
4. Wait a few seconds.

You should hear the computer shut down. If it does not, you may force it to shut down by pressing and holding the Power button until the computer shuts down. This may take up to 10 seconds.

Note: Pressing and holding the Power button does not shut down a PowerBook G3 Series (Bronze Keyboard) computer. You may use the Control-Command (Apple)-Power key combination to force a restart.

After the PowerBook is shut down, connect or disconnect the monitors as desired and restart.

Published Date: Oct 11, 2016

Mac OS X 10.0: Many Third-Party Ink Jet Printer Drivers Are Built In

Mac OS X includes preinstalled drivers for many popular third-party ink jet (raster) printers.
This article has been archived and is no longer updated by Apple.
The default installation of Mac OS X 10.0 includes drivers written by Canon, Epson, and Hewlett-Packard for certain models of their respective printers. If you own one of the printers listed below, simply connect it to your Macintosh -- and Mac OS X automatically sets up Print Center to use the printer. If you have updated to Mac OS X 10.1, see technical document 106490: "**Mac OS X 10.1: Many Third-Party Ink Jet Printer Drivers Are Indcluded**"

Printer drivers included

Canon

- BJF360
- BJF660
- BJF870
- BJS600
- S400
- S450
- S600
- S800

Epson

- Stylus COLOR 680
- Stylus COLOR 740
- Stylus COLOR 760
- Stylus COLOR 777
- Stylus COLOR 860
- Stylus COLOR 880
- PM-720C
- PM-780C
- PM-880C
- PM-900C
- PM-3500C

Hewlett-Packard

- Deskjet 810
- Deskjet 812
- Deskjet 816
- Deskjet 830
- Deskjet 832
- Deskjet 840
- Deskjet 842
- Deskjet 880
- Deskjet 882
- Deskjet 895
- Deskjet 930
- Deskjet 932
- Deskjet 935
- Deskjet 950
- Deskjet 952
- Deskjet 955
- Deskjet 957
- Deskjet 960
- Deskjet 970
- Deskjet 990

Apple may add more printer drivers with a later version of software. If your printer is not listed here, check with your printer's manufacturer to

determine availability of drivers for use in Mac OS X.

Notes

1. Some printing features are not included in Mac OS X 10.0, such as custom paper sizes, banner printing, booklet printing, and watermarks.
2. ColorSync color matching may produce unexpected results when printing to any raster printer.
3. Some of the listed printers may include built-in or add-on network adapters. The drivers included with Mac OS X 10.0 only work with these printers when they are directly connected to the computer's USB port. These drivers do not have a network connection feature for any of these printers.

Published Date: Oct 7, 2016

Mac OS X 10.0: May Start Up From Wrong System Folder When Multiple Versions Are Installed

Your computer may start up from the wrong System Folder when multiple versions of Mac OS X are installed.

This article has been archived and is no longer updated by Apple.

Symptom

The computer does not start up from the System Folder selected in the Startup Disk pane of the System Preferences application.

Solution

If multiple version of Mac OS X are installed on an affected computer, the Startup Disk setting may be ignored.

On the affected computers, you should not install different versions of Mac OS X on different partitions or disks.

Published Date: Oct 7, 2016

Mac OS X 10.0: Setup Assistant and AppleVision Display 640- by 480-Pixel Resolution

The welcome and registration screens may not be entirely visible after installing Mac OS X 10.0 when using an AppleVision 1710 Display.
This article has been archived and is no longer updated by Apple.

Symptom

After installing Mac OS X 10.0 on a computer that is connected to an AppleVision 1710 or 1710AV display, some areas of the welcome and registration screens may not be visible.

Solution

The welcome and registration screens function in 800- by 600-pixel or larger resolution. The affected displays temporarily use a 640- by 480-pixel resolution after installing Mac OS X 10.0.

If your computer has a built-in ADB port, verify that the ADB cable from the AppleVision 1710 or 1710AV Display is properly connected. Power Macintosh computers made earlier than the Power Mac G4 have built-in ADB ports.

If your computer does not have a built-in ADB port, you may try to complete the Setup Assistant in the lower resolution and then correct any errors in the System Preferences application. Alternatively, you may shut down the computer and temporarily use a different monitor.

Note: Aside from this issue, the affected displays work with Mac OS X 10.0 and will offer other resolutions after bypassing the setup assistant.
Published Date: Oct 7, 2016

Mac OS X 10.0: Help Viewer - "The Specified HTML File Could Not Be Found"

Help Viewer does not display content if the Mac OS X hard disk name contains certain characters. These characters include the solidus (/) character and the trademark character (TM).
This article has been archived and is no longer updated by Apple.

Symptom

The Mac OS X Help Viewer reports "The Specified HTML File Could not Be Found" when a Help topic is selected.

Solution

Remove any solidus (/) or trademark (TM) characters from the name of the Mac OS X hard disk or partition. You can substitute another character, such as a comma, ampersand, or underscore. If this issue occurs with any other alphanumeric character, particularly í, é, á, ú, ö, ü, or ö, try removing it as well.
Published Date: Oct 7, 2016

Mac OS X, Mac OS 9: Use Current Startup Disk Control Panel or Mac OS 9.2.2

You should update your Mac OS 9.1 Startup Disk control panel to version 9.2.1 or later. Updating to Mac OS 9.2.2 is recommended for best Mac OS X compatibility (applicable when both are installed on the same computer).
This article has been archived and is no longer updated by Apple.
Note: If you are using Mac OS 9.2.1 and Mac OS X 10.1 , you already have the appropriate Startup Disk Control Panel installed and do not need to use the information in this document.

When both Mac OS 9 and Mac OS X are installed on the same computer, use Mac OS 9.2.2 for best results. You may update to Mac OS 9.2.2 from earlier Mac OS 9 versions by using Apple Software Downloads (http://www.apple.com/swupdates/).

If Mac OS 9.0 to 9.0.4 is installed and you are unable to select the Mac OS X System folder in your Mac OS 9 Startup Disk control panel, you should install Mac OS 9.2.2. The Mac OS X 10.2 Classic environment cannot use a Mac OS 9.0 to 9.0.4 System Folder.

For a temporary workaround, you may install Startup Disk control panel 9.2.1, available from software download document120024, "**Startup Disk 9.2.1 Document and Software**".

Notes

1. On some computer models, you can force-start up from Mac OS X by pressing the X key during startup.

2. If you have Mac OS X 10.0, you should restart your computer from Mac OS 9.1 or later before installing any Mac OS 9 software updates that you have downloaded.

3. For potentially related information, see technical document 107285, "**Macintosh: Computer Can Start Up From Mac OS X But Not From Mac OS 9**".

Published Date: Oct 7, 2016

Mac OS X 10.0: Does Not Recognize and Cannot Be Installed on UFS Disks Formatted by Drive Setup 1.8.1

Mac OS X 10.0 does not recognize Mac OS UFS disks or partitions formatted with Drive Setup 1.8.1, which was included with some versions of Mac OS 9.

This article has been archived and is no longer updated by Apple.

Symptom

1. In the Mac OS X 10.0 Installer, only a Mac OS Extended (HFS Plus) partition appears.
2. When started up from Mac OS X 10.0, a UFS disk or partition is not available (does not mount).

Solution

Mac OS X 10.0 and its Installer do not recognize a file system on Mac OS UFS disks or partitions formatted by Drive Setup 1.8.1. Subsequently, the Installer does not allow installation on such a disk or partition. To make this disk space available to Mac OS X 10.0, you must reinitialize the disk.

Warning: Always back up data you wish to keep before initializing a hard disk. Initialization erases all data on the hard disk.

Steps to initialize the startup disk:

1. Start up the computer from the Mac OS X 10.0 Installation CD-ROM.
2. At the first screen, choose Open Disk Utility from the Installer menu.

Note: Do not click Continue. If you do, you must restart from CD. There is not an option for backing up.

3. Select Drive Setup.
4. Select the hard disk you are going to reformat.
5. Click the Partition tab.
6. Set up the desired partition scheme and format.
7. Click Partition.

After this process is complete, Mac OS X 10.0 and its Installer can use the disk.

Published Date: Oct 7, 2016

Mac OS X: Ejecting (unmounting) a partition ejects all on same disk; File Sharing and Classic are affected

This article has been archived and is no longer updated by Apple.

If you eject (unmount) any partition on a disk, all partitions from the same disk are also ejected, except for a partition that contains the startup System Folder. File Sharing and Classic are also affected.

Note: Apple does not ship Mac OS X installed on partitioned hard disks. This document applies to systems using hard disks that have been intentionally reformatted and partitioned.

Tip: Ejecting a volume may not mean that it is physically ejected from the computer, but that it is no longer available (mounted) on the desktop or in a Finder window.

Tip: With Mac OS X 10.3 and 10.4, you can eject a single partition or volume, if you wish, by using Disk Utility. You cannot eject a partition via the Finder in Mac OS X 10.4.

Symptom

1. Effect on a startup disk:
When three or more partitions are on the startup disk, ejecting one partition causes all other partitions, except the startup partition, to also be ejected.

2. Effect on a non-startup disk:
Ejecting one partition on the disk causes all partitions to be ejected. Removable media are physically ejected.

3. Effect on File Sharing:
Sharing from the startup partition via AppleShare (AFP) becomes unavailable, but FTP remains available.

4. Effect on Classic:
If you eject the partition that contains Mac OS 9 and then try to start up Classic, you an alert box with this message appears:

"To start Classic, you need Mac OS 9.1 or later installed. See your documentation for instructions on installing this software."

Note: The volume containing the designated Classic System Folder (Mac OS 9) also counts as a startup partition. If Mac OS X and Mac OS 9 are installed on separate partitions and Classic is running, then neither of the two partitions would be ejected.

"To start Classic, you need Mac OS 9.1 or later installed. See your documentation for instructions on installing this software."

Solution

Check before you eject

Before you eject a partition, be sure that any files contained on it are no longer in use. Look at the Dock to see what applications are active.

To make a partition available again

For removable media, reinsert the media.

1. To use a hard disks partition, restart the computer to make all partitions available, or use Disk Utility instead. Follow these steps to use Disk Utility:
2. Open Disk Utility (/Applications/Utilities/).
3. Click the disclosure triangle to the left of the hard drive icon to display the names of your hard disk volumes and partitions.
4. Select any dimmed partition name in the Disk Utility window. It is not necessary to select more than one dimmed partition name.
5. Choose Mount from the Options menu. All non-mounted partitions on the selected hard disk appear on the desktop again.
6. Quit Disk Utility.

Published Date: Oct 7, 2016

Mac OS X 10.0: Creating a Login Hint

The Login pane of System Preferences states that "A hint can be created in the Password pane," but no such pane exists.
This article has been archived and is no longer updated by Apple.

Symptom

There is no apparent "Password pane" for showing hints when logging in to Mac OS X. There is only a Password field.

Solution

1. Choose System Preferences from the Apple menu.
2. Click Login.
3. Click the Login Window tab.
4. Be sure the checkbox for "Show password hint after 3 attempts to enter a password" is checked.
5. Click Show All.
6. Click Users.
7. Click the name of the user you wish to have a hint.
8. Click Edit User.
9. Type the text you want in the Password Hint field.
10. Click save.

The next time this user enters the wrong password three times while logging in, an alert box should appear that contains the hint.

Note: In the Mac OS X 10.1 release, the Users Preference pane on the Password tab provides a field to enter a password hint. The Login Window tab of the Login Preference page is still used for allowing/disallowing password hints.
Published Date: Oct 7, 2016

Mac OS X: Built-in Floppy Disk Drives Not Recognized

Mac OS X recognizes floppy disks from some third-party USB drives but not from built-in floppy disk drives.
This article has been archived and is no longer updated by Apple.

Symptom

- Built-in floppy disk drives show no sign of activity when a disk is inserted. The floppy disk does not appear on the desktop, or in a Finder window.
- You must eject the disk manually using a paper clip or restart from Mac OS 9 to eject the disk.

Solution

1. Open System Preferences.
2. Click Startup Disk.
3. Select a Mac OS 9 System Folder.
4. Restart the computer.
5. Either copy the information from the desired floppy disk(s) onto your hard disk or use the Disk Copy utility to create disk images of the floppy disk(s).

   Note: Be sure to put the copied files or disk images in a location that is accessible when the computer is started up from Mac OS X. A folder in your Home directory would be the best place to put the files.

6. Open the Startup Disk control panel.
7. Select the Mac OS X System Folder.
8. Restart the computer.

For related information on locating and using your Home directory, see the document Mac OS X: Using Your Home Directory.

Mac OS X: Disk Appears Dimmed (or "Grayed Out") in the Installer

On certain computers, Mac OS X cannot install on a volume that is not completely contained within the first 8 GB of an ATA hard disk. Other possible causes that affect any Mac OS X-compatible computer are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
This information is also available in the Before You Install document included with Mac OS X.

Symptom

A volume appears dimmed or "grayed out" in the Mac OS X Installer. You cannot select it as the install destination.

Note: "Volume" in this instance refers to either an ATA hard disk or an ATA hard disk partition.

SCSI hard disks may not be affected, regardless of their storage capacity.

Solution

If you do not have one of the computers listed specifically in the "Products affected" section, skip down to the "Additional Causes" section.

On the listed computers, Mac OS X must be installed on a volume that is contained entirely within the first 8 GB of its ATA hard disk. You may partition your hard disk to facilitate installation.

Note: Even if your hard drive was sold as having an 8 GB capacity, it may still be affected. Many hard drive manufacturers slightly understate the actual size of their hard drives to account for the space which is used in formatting. A hard drive sold as having an 8 GB capacity may actually be 8.25 GB, for example.

This generally breaks into three scenarios:

1. The hard disk is larger than 8 GB and is not partitioned.

   In this circumstance, you may partition the disk to create a volume that falls entirely within the first 8 GB of the disk.

2. A partitioned hard disk has at least one volume in the first 8 GB.

   For example: If you had a 12 GB disk divided into three partitions of 3 GB , 3 GB, and 6 GB, respectively, then the first and second would be available to the Installer and the third dimmed. You could choose to install only on the first or second partition. If the first two partitions are already full, you could start up from a Mac OS 9.x CD to backup data from one of the first two to the third partition, then empty or erase the backed-up partition to free space for Mac OS X.

3. A partitioned hard disk does not have a volume in the first 8 GB.

   For example: If you had a 20 GB disk divided into two equal partitions, both would appear dimmed in the Installer, since neither partition would be contained within the first 8 GB. In this circumstance, you may partition the disk to create a volume that falls entirely within the first 8 GB of the disk.

How to partition the disk

Warning: Always backup data you wish to keep before initializing and partitioning a hard disk. Initialization erases all data on the hard disk.

Important: If your hard disk was sold as 8 GB and appears affected by this issue, you should create at least two partitions to ensure that the symptom does not recur. The second partition could be just enough megabytes of unallocated space to offset the actual size of your disk, or it could be a significant portion. The choice of how to manage the disk space is up to you.

Steps to initialize and partition the startup disk:

1. Start up the computer from the Mac OS X 10.0 Installation CD-ROM.
2. At the first screen, choose Open Disk Utility from the Installer menu.

   Note: Do not click Continue. If you do, you must restart from CD. There is not an option for going back.

3. Select Drive Setup.

4. Select the hard disk you are going to partition.
5. Click the Partition tab.
6. Set up the desired partition scheme and format.

Note: This is the critical step for this issue. Be sure that the first partition stays within the first 8 GB of the disk.

7. Click Partition.

After the process is complete, you may install Mac OS X on the disk.

Additional Causes

The following circumstances may cause a volume to appear dimmed in the Installer on any Mac OS X-compatible computer. In Mac OS X 10.1 and later, you can move the mouse pointer over a dimmed volume to reveal more information about why the volume is unavailable.

1. The volume does not have enough available space to accommodate the installation of Mac OS X.
2. You are attempting to install an incompatible Mac OS X (client) update when Mac OS X Server is already installed. Not all Mac OS X updates can be installed with Mac OS X Server. A message to this effect may appear when you move the pointer over the volume in question.
3. The disk format of the affected volume is not compatible with Mac OS X or cannot be converted by the Installer. For more information see technical document 106229: "**Mac OS X 10.0: Does Not Recognize and Cannot Be Installed on UFS Disks Formatted by Drive Setup 1.8.1**"
4. The volume is read only, such as a CD-ROM disc.
5. The volume is of a type that cannot be used as a Mac OS X startup disk. USB hard drives, for example, are not fast enough to be Mac OS X startup disks, though they work normally as data volumes.

Published Date: Oct 7, 2016

Mac OS X 10.0: Included 9.1 CD Cannot Start Up Latest Computers

The Mac OS 9.1 CD-ROM included with Mac OS X does not start up computers introduced in early 2001.
This article has been archived and is no longer updated by Apple.

Symptom

A flashing question mark appears if you try to start up an affected computer from the Mac OS 9.1 CD included with Mac OS X 10.0.

Solution

Use the Mac OS 9.1 CD that came with your computer. Because your computer was produced after the release of Mac OS 9.1, it requires the computer-specific version of Mac OS 9.1 that came with it.
Published Date: Oct 7, 2016

Mac OS X 10.0: iSub Makes No Sound

In its initial release, Mac OS X 10.0 does not work with the iSub speaker.
This article has been archived and is no longer updated by Apple.

Symptom

Sound is heard from other speakers, but no bass comes from the iSub.

Solution

Mac OS X 10.1 provides sound for the iSub speaker, but there is not a graphical user interface component for iSub volume control. For related information, please see technical document 106562: "**Mac OS X 10.1: Hot-Plugged Speakers Do Not Respond to Volume Change**"
Published Date: Oct 7, 2016

Mac OS X 10.0: Do Not Use "root" as a User Name

The name "root" is reserved for system purposes and should not be used.
This article has been archived and is no longer updated by Apple.

Symptom

If you create a user named "root" in the Setup Assistant or Users control panel, you may encounter unforeseen difficulties caused by a conflict between two "root" user accounts.

When setup assistant creates the first user account it is created with a specific numeric user ID. This ID is different from the built in 'root' account and conflicts can arise if two 'root' accounts exist.

Solution

Do not use the name "root." Pick a different name for the user account.

The name "root" is reserved for system use in UNIX-like operating systems. Conflicts between the operating system's root user and your "root" user can arise if you choose this name.
Published Date: Oct 7, 2016

Mac OS X 10.0: Generic Folders Appear in the Dock and Applications Folder

Under certain conditions, applications appear as generic folders in the Dock and the Applications folder.
This article has been archived and is no longer updated by Apple.

Symptom

After installing Mac OS X 10.0, applications in the top-level Applications folder and in the Dock have icons that look like plain folders instead of their regular application icons.

This symptom may appear with or without this alert message:

> "Your Home folder is not available. The server where it's stored may be temporarily unavailable. . . Contact your network admin."

Solution

There are two possible solutions:

I. Disk Utility or fsck

First, try using Disk Utility or fsck to verify and repair the disk. If the issue persists, try the second solution.

For information on using Disk Utility or fsck, please see:

Article 106214: "**Mac OS X 10.0: Why, When, and How to Run fsck for File System Maintenance**"

II. Removing Preference files

You can resolve this issue when started up from Mac OS 9.x or Mac OS X. You must navigate to the filepath /Users/<user name>/Library/Preferences and delete three files. Follow these steps:

1. Open the Mac OS X disk in the Finder.
2. Open the Users folder.
3. Open the folder named after the affected user.
4. Open the Library folder in that user's folder.
5. Open the Preferences folder in that Library folder.
6. Drag these files to the Trash:
LSApplications
LSClaimedTypes
LSSchemes
7. If you are using Mac OS X, choose Log Out from the Apple menu.
8. Log back in as the affected user.
9. If you are working in Mac OS 9.x, restart the computer from Mac OS X and log in as the affected user.

The correct icons should now appear.

Mac OS X 10.0: Available/Used Disk Space Does Not Appear in Show Info

The Show Info window does not display available or used disk space when the disk is selected from the desktop.
This article has been archived and is no longer updated by Apple.

Symptom

The Show Info window does not display available or used disk space.

Solution

Select the disk in a Finder window when using Show Info.

You can follow these steps:

1. Click Finder in the Dock.
2. Click Computer in the Finder window.
3. Select the disk you want to examine.
4. Choose the Show Info command from the File menu.

Note: If the Finder toolbar is not visible, you can click the show/hide button in the top right corner of the Finder window.

Mac OS 9.1, Mac OS X 10.0: "To install this software you must boot with the Mac OS CD" Message

If you have not installed Mac OS 9.1 before installing Mac OS X 10.0, use this workaround in this document.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to install Mac OS 9.1, an alert box appears with this message:

> "To install this software you must boot with the Mac OS CD. Consult 'Before you install' for instructions."

Solution

Note: For purpose of this discussion, "volume" means a hard disk or hard disk partition.

If you plan to install both Mac OS X and Mac OS 9.1 on the same volume, you should install Mac OS 9.1 first.

This symptom occurs if you install Mac OS X on a volume that does not contain any version of Mac OS 9 and then follow with an attempt to install Mac OS 9.1 on the same volume.

To work around this issue, use the clean installation option in the Mac OS 9 Installer.

Published Date: Oct 7, 2016

Mac OS X 10.0: Unexpected Classic Behavior When Using Mac OS 9.1 All or Base Extension Sets

Because the Mac OS 9.1 All and Base extension sets do not include items added by Classic, you may see strange or unexpected behaviors in Classic when either of these sets is in use.
This article has been archived and is no longer updated by Apple.

Symptom

Classic applications may not behave as expected. Some Classic windows may not be visible.

Solution

The Classic environment adds components to your Mac OS 9.1 System Folder that are necessary for it to work properly. The Mac OS 9.1 All and Mac OS 9.1 Base extension sets do not include some of these components. When you restart Classic using one of these extension sets, it does not behave as expected. To use one of these extension sets, create a copy and add any Classic components that have been disabled. You must be logged in to the computer as an Admin user to follow these steps:

1. Open a Classic application.
2. With the Classic application in the foreground, select Control Panels from the Classic Apple Menu.
3. Open the Extensions Manager control panel.
4. Choose the desired set from the Selected Set pop-up menu.
5. Choose Duplicate Set from the File menu.
6. Give the new copy a name, such as "Mac OS 9.1 All (Classic)", that will remind you what this set contains.
7. Choose "as Items" from the View menu.
8. Click the Package column in the Extensions Manager window to sort by package name.
9. Scroll down to locate the "Classic Compatibility Environment" package items (Figure 1).

Figure 1 The Extensions Manager control panel

10. Be sure that the checkbox next to each one of these items is checked. Click the box in the On/Off column to add an "x."
11. Close the Extension Manager control panel.

The next time you restart Classic, your new extension set will be active.

Update to Mac OS 9.2.1 and Mac OS X 10.1 to avoid this issue. Mac OS 9.2.1 contains Extension Manager control panel sets which already include Classic Environment components.

Mac OS X, AirPort: Connecting to Third-Party Base Stations

You may need to format your password in a specific way before connecting to (or "associating with") third-party wireless access points with AirPort in Mac OS X

This article has been archived and is no longer updated by Apple.

Symptom

When you try to connect to (or "associate with") a third-party wireless access point, the password or WEP key does not appear to work.

Solution

Many third-party wireless access points use a WEP key or a password entered either as a string of hexadecimal numbers or as five ASCII characters.

To connect Mac OS X to a third-party wireless access point that is configured to use WEP, format your password one of these two ways:

1. Hexadecimal - precede the string with a dollar sign ($). For example: $123456789a
2. ASCII - enclose the characters in double quotes ("). For example: "magic"

Notes:

1. This is similar to the situation in which a third-party wireless client attempts to connect to an AirPort Base Station. But in this case, the WEP key or password must be obtained from the network administrator. It cannot be obtained using the Network Equivalent Password algorithm found in the AirPort Admin Utility.

2. Some third-party base stations offer features for supporting up to four WEP keys. On these systems, make sure that the AirPort password is entered in the primary password field (first). Other settings may be required so refer to the manufacturer's instructions for additional information.

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

Published Date: Oct 7, 2016

Mac OS X: kmod_destroy Messages Are Harmless

The kmod_destroy message (sometimes seen in single-user and verbose modes) are normal and do not indicate a serious condition.
This article has been archived and is no longer updated by Apple.
If you start up Mac OS X in single-user mode or verbose mode, you may see some messages that look like this:

> Feb 15 17:22:09 localhost mach_kernel: kmod_destroy: com.apple.iokit.AudioDeviceTreeUpdater (id 16), deallocating 3 pages starting at 0x7204000

You may safely ignore these messages.

These messages only indicate that drivers are being unloaded to conserve memory when the devices they support are not found. These messages may also appear in the file /private/var/log/system.log.

If you are using the log to gather information about another issue, look for the lines just before or just after this text, starting from the last line of text and reading backwards several lines.
Published Date: Feb 17, 2012

Mac OS X 10.0: AirPort Does Not Work From UFS Partition

Mac OS X does not recognize an AirPort card when started up from a disk formatted as UNIX File System (UFS).
This article has been archived and is no longer updated by Apple.

Symptom

Your AirPort card is not recognized.

Solution

This issue is resolved in Mac OS X 10.1 and later. For versions of Mac OS X prior to 10.1, install Mac OS X on a disk or partition that is formatted using the Mac OS Extended (HFS Plus) format.

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

Mac OS X 10.0: Power Macintosh G3 Makes No Sound

Some Power Macintosh G3 computers do not produce sound in Mac OS X, even though the computer's sound is normal when started up from Mac OS 9.x.

This article has been archived and is no longer updated by Apple.

Symptom

No sound is produced when started up from Mac OS X on a Power Macintosh G3.

Solution

Install Mac OS X 10.0.3 Update or later to resolve this issue.

Published Date: Feb 17, 2012

Mac OS X 10.0: Disk First Aid Runs When Mac OS 9 Starts up After Using Mac OS X

It is normal for Disk First Aid to check your hard disk each time you restart the computer from Mac OS 9.x after using Classic in Mac OS X.
This article has been archived and is no longer updated by Apple.

Symptom

Disk First Aid checks your hard disk at system startup time, even though your computer was shut down properly. You see a message that your computer was not shut down properly.

Solution

This issue is resolved in Mac OS X 10.1 or later. For earlier versions:

Allow Disk First Aid to check your disk, then click Done. This issue does not indicate any actual trouble with your computer, despite the message you see on screen.

Each time you start up your computer from Mac OS 9.x, it checks the disk to see if the file system was "clean" or "dirty" after the previous shutdown. If you last started up from Mac OS X and used the Classic environment, Mac OS 9.x incorrectly determines that the previous shutdown was "dirty," or improper. This causes Disk First Aid to automatically check the disk at system startup time.

Note: If you have more than one hard disk or partition, then the one designated as the Classic startup volume in Mac OS X System Preferences gets erroneously marked "dirty."
Published Date: Oct 7, 2016

Mac OS X 10.0: Sleep Choice Dimmed When PCI Card Is Installed

A PCI card may make Sleep unavailable in the Apple Menu and prevent the computer from entering full sleep mode after a period of inactivity. This article has been archived and is no longer updated by Apple.

Symptom

The Sleep command in the Apple menu appears dimmed (or "grayed out"). The computer does go into sleep mode for a period of inactivity as defined in the Energy Saver pane of the System Preferences application.

Solution

Some PCI cards may prevent Mac OS X from entering sleep mode. Your computer should sleep when the PCI card is not present.

Note: Apple-original video cards installed in the dedicated video slot do not cause this symptom. If you have additional Apple Configure-to-Order video cards installed in other PCI slots, you may experience this issue.

Even if you have a PCI card that prevents full sleep, you may still use other Energy Saver features. You may set system sleep to "Never" in the Energy Saver pane of System Preferences while maintaining monitor sleep and hard disk spin down.

Published Date: Oct 7, 2016

Mac OS X: Deleting a Former User‘s Home Directory (Folder)

Mac OS X 10.2 and later make it easier to remove the files of a deleted user account. This document describes steps for doing so in Mac OS X 10.0 to 10.1.5.
This article has been archived and is no longer updated by Apple.

Symptom

After deleting a user in the Users pane of System Preferences, that former user's Home directory remains on the hard disk and cannot be deleted by dragging it to the Trash. The word "Deleted" is added to the name of the former user's Home directory. If you try to drag this folder to the Trash, an alert box appears with the message:

> "The item '<user name> Deleted' cannot be moved to the Trash because it cannot be deleted."

Note: Hierarchical directories on a disk appear on screen as folders. The terms "directory" and "folder" are interchangeable in the context of Mac OS X. Users of UNIX-like operating systems expect the term "home directory."

For related information, please see:

Article 106167: "**Mac OS X: Using Your Home Directory**"

Solution

With Mac OS X 10.2 or later, deleted users' folders are handled differently. The contents of the deleted folder are compressed on to a disk image, named "<deleted_username>.img". This disk image is placed in the Deleted Users folder located in the Users folder of the startup disk (/Users/Deleted Users/). Admin users may leave them for reference or simply drag them to the Trash, as desired. The steps below are not necessary.

In Mac OS X 10.0 to 10.1.5, the Home directory of a deleted user reverts to the ownership of the Admin user(s). This allows the Admin user to examine, move, or back up the contents of the former user's Home directory before disposing of it. Once you are certain that you have moved or backed up anything that you wish to keep from the former user's Home, you may follow these steps to delete the "Deleted" folder:

1. Log in to Mac OS X as an Admin user.
2. Open the Terminal utility.
3. Type: `sudo rm -rf /Users/shortname\\ deleted`
   Important: Where the example says "shortname," you would insert the former user's short name, which is the name (preceding "Deleted") on the Home directory you wish to delete. This step does not work if you have not already deleted the user in the Users pane of System Preferences.
   Warning: Type carefully. Specifying the wrong directory path can result in data loss, including to system files.
4. Press Return.
5. Type your Admin user password.
6. Press return.

The former user's Home directory is now deleted. The Finder may not display this change immediately.

Note: Deleting a former user's folder is an optional aesthetic action. Without following these steps, an Admin user may still reduce a former user's Home directory to a negligible amount of disk space by simply dragging all of its contents to the Trash. In the event that you cannot do this, it may be because the former user's Home directory was assigned to "System Administrator" (which is different from an Admin user). For more information on this scenario, see technical document 106840, "**Mac OS X: Unable to Access Delete/Former User's Files or Folders**".
Published Date: Oct 7, 2016

Your computer‘s name does not appear on the network

Use these troubleshooting steps to allow others to connect to your Mac OS X computer.

This article has been archived and is no longer updated by Apple.

There are three major types of symptom. Find the symptom that matches your computer, then choose the appropriate solution.

1. Your computer name does not appear in the Chooser, Network Browser, or Connect to Server dialog of other computers; but your computer does have access to the Internet or other network services.

2. Your computer name fails to appear in the Chooser, but it does appear in the Network Browser and in the Connect to Server dialog of other Mac OS X computers. Others can connect to your computer by entering its IP address and by using the Network Browser and Connect to Server dialog.

3. In addition to not appearing on the network, you discover that your computer does not have any network or Internet services at all.

Tip: The Connect to Server command is located in the Finder's Go menu in Mac OS X. The Chooser and Network Browser are found on computers with Mac OS 9 or in the Classic environment of Mac OS X. When using Network Browser or Connect to Server, Mac OS X computers appear by default in the Local Services neighborhood.

Though this article does not focus on troubleshooting Mac OS 9, it describes symptoms that you may notice from a computer with Mac OS 9 or earlier.

If your computer has Symptom 1:

This may indicate that file sharing is off.

1. Choose **System Preferences** from the **Apple** menu.
2. Click the Sharing icon.
3. If File Sharing is off, click Start.
4. Check to be sure there is a name in the Computer Name field. You may need to stop and restart file sharing for this change to take affect.

If you have not turned on AppleTalk, your computer will not appear in the Chooser (Symptom 2, described above).

Computers connected to the Internet via telephone modem ("dial-up") or DSL, for example, will not be able to browse by computer name. If you are connecting from remote locations across the Internet you must connect by entering the IP address or DNS name of a computer. Browsing for computer name requires that computers be on either a local area network (LAN) or a wide are network (WAN). The way your network is routed can affect your ability to browse by computer name. Firewalls may be configured to prevent File Sharing with remote locations. You may ask your network administrator or Internet service provider about firewalls and routing.

If your computer has Symptom 2:

This symptom simply indicates that AppleTalk is turned off, or that AppleTalk is active on more than one port (Note 3 below). To make AppleTalk active:

1. Choose **System Preferences** from the **Apple** menu.
2. Click Network.
3. Choose the network interface you wish to use from the Show pop-up menu ("Configure" menu prior to Mac OS X 10.1).
4. Click the AppleTalk tab.
5. Click the checkbox to select Make AppleTalk Active.
6. Click Save.
7. Click Show All.
8. Click Sharing.
9. Click Stop and wait for Sharing to stop.
10. Click Start and wait for Sharing to start.

If you turn AppleTalk on while Sharing is on, you may need to stop and restart Sharing for your computer to start broadcasting its AppleTalk name.

You may still connect using the computer's IP address when AppleTalk is off.

AppleTalk may not behave as expected if it is active on more than one port (multi-homing). Specific requirements must be met to multi-home with AppleTalk in Mac OS X versions 10.0 to 10.1.5. In Mac OS X 10.2 or later, you may only use AppleTalk on one network interface, or one of several port configurations of the same network interface (if thus configured). For more information, see technical document 106614: "Mac OS X: How to Set Up AppleTalk Multi-Homing"

If your computer has Symptom 3:

1. Check to ensure that your computer is physically connected to a network. This means checking your phone line, Ethernet cable, or AirPort card for a proper connection. (See Notes below.)
2. Choose System Preferences from the Apple menu.
3. Click Network.
4. Choose the network interface you wish to use from the Configure pop-up menu.
5. Click the TCP/IP tab.
6. Check to be sure that your computer has an IP address that is valid for your network. If your Configure menu is set to
7. Manually, you also need to ensure that the Router and Subnet Mask entries are correct for your network. If you are not sure, check with the network administrator.
8. Click Show All.
9. Click Sharing If Sharing is not already on, click Start.

To see instructions for installing an AirPort card and connecting the antenna, you may search the for the phrase "AirPort and install." Select the article that matches your computer.

Computers connected to the Internet via telephone modem ("dial-up") or DSL, for example, will not be able to browse by computer name. If you are connecting from remote locations across the Internet you must connect by entering the IP address or DNS name of a computer. Browsing for computer name requires that computers be on either a local area network (LAN) or a wide are network (WAN). The way your network is routed can affect your ability to browse by computer name. Firewalls may be configured to prevent File Sharing with remote locations. You may ask your network administrator or Internet service provider about firewalls and routing.

106262: "Mac OS X 10.0: Connecting to AppleShare or File Sharing Requires TCP/IP"

Important: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some Internet service providers are not compatible with AirPort. Read more about AirPort requirements for wireless Internet access.

Published Date: Feb 17, 2012

Mac OS X 10.0: Connecting to AppleShare or File Sharing Requires TCP/IP

Mac OS X versions 10.0 to 10.0.4 connect to AppleShare (AFP, file sharing) only over the TCP/IP protocol, not over AppleTalk.
This article has been archived and is no longer updated by Apple.

Symptom

1. Some computers that appear in the Chooser do not appear in the Connect to Server dialog.

2. The following message appears in an alert box when you attempt to use the Chooser in the Classic environment:

"The AppleShare server you are trying to connect to appears not to support the IP protocol required by Mac OS X. Check with the server's administrator if a 'Server IP Address' is available."

Solution

Update to Mac OS X 10.1, which can connect to AppleShare over the AppleTalk protocol. The following section is useful if you do not yet have the Mac OS X 10.1 Update. It may also provide you with useful background information.

Connecting in Mac OS X 10.0 to 10.0.4

Mac OS X versions 10.0 to 10.0.4 only connect to AppleShare volumes over the TCP/IP protocol. Mac OS 8.6 and earlier, as well as some third-party server products, only offer AppleShare over the AppleTalk protocol. Since Mac OS X cannot connect to them, you can reverse the sharing relationship as a workaround: Set up File Sharing on the Mac OS X computer and then connect from the Chooser of the AppleTalk-only computer. Using this method, you can still copy files between the computers. Alternatively, you can update the earlier operating system to Mac OS 9 or later to achieve true bidirectional sharing.

Mac OS 9 and certain versions of AppleShare IP do not share over TCP/IP by default, so you must select this option. The following sections can help you do this or perform the workaround.

Making Mac OS 9 available via TCP/IP

1. Open the File Sharing control panel.
2. Click the checkbox to enable the "Enable File Sharing clients to connect over TCP/IP" option. (Your computer must already be set up on a TCP/IP network.)
3. Close the File Sharing control panel.

Mac OS X connects to Mac OS 9 computers that have this option enabled. Choose the Connect to Server command from the Go menu.

Making AppleShare IP servers available via TCP/IP

Using your server admin application, be sure that services are enabled over TCP/IP in addition to AppleTalk. This option is located in the AppleShare section of the admin application.

Connecting to Mac OS X from an earlier Mac OS

Computers using Mac OS 9 and earlier may connect to your Mac OS X computer from the Chooser, either by browsing AppleTalk names or by using an IP address.

Note: AppleTalk must be enabled on the Mac OS X computer for its name to appear in the Chooser.

Setting up File Sharing in Mac OS X

For information on setting up File Sharing in Mac OS X, see technical document 106461: "**Mac OS X: File Sharing**"

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.0: No Sound on Power Mac G4 (Digital Audio) 533 MHz Dual Processor

This article describes an issue when a Power Mac G4 (Digital Audio) 533 MHz dual processor computer stops making sound shortly after it is turned on.
This article has been archived and is no longer updated by Apple.

Symptom

Sound functions as expected after you turn the computer on. This can range from a few seconds up to 30 minutes. After this period, the computer makes no more sound until it restarts or wakes from sleep.

Sound functions normally when started up from Mac OS 9.x.

Note: This issue has only been reported on this hardware configuration.

Solution

Install Mac OS X 10.0.3 Update or later to resolve this issue.
Published Date: Oct 7, 2016

Mac OS X: Applications Do Not Work Automatically If Utilities Folder Is Renamed

If you rename the Utilities folder, applications contained in that folder will not open automatically when called by other processes.
This article has been archived and is no longer updated by Apple.

Symptom

Any process that would normally make automatic or transparent use of items in the Utilities folder may fail.

Printing from an application, for example, fails without an alert when the path to the Print Center is not found.

Solution

1. Select the folder formerly named Utilities.
2. Choose Show Info from the File menu.
3. In the name field of the Info window, change the name back to Utilities.

Note: If, for some reason, you cannot tolerate a folder named Utilities, you may open the utility applications manually. In the example used above, printing would succeed if the Print Center application were first opened manually. This is not a preferred course of action.

Mac OS 9.1: Scroll Wheel Does Not Respond After Hot Plugging

The scroll wheel on a third-party USB mouse or other input device may not respond after hot plugging.
This article has been archived and is no longer updated by Apple.

Symptom

The scroll wheel on your third-party mouse, trackball, or other device does not respond after hot plugging.

Note: "Hot plugging" describes the capability of USB and FireWire devices to be plugged in and unplugged while the computer is turned on.

Note: You may only experience this issue on a computer that originally came with Mac OS 9.1.

Solution

Restart the computer to regain scroll wheel function.
Published Date: Oct 7, 2016

Mac OS X 10.0: Using the Keyboard Control Panel in Classic

A Classic application must be in the foreground for Classic-defined function keys to take effect.
This article has been archived and is no longer updated by Apple.

Symptom

The function keys do not behave as defined in the Classic Keyboard control panel.

Solution

Function key actions defined in the Mac OS 9.x Keyboard control panel only work when the selected and running (or "foreground") application is a Classic application.

Mac OS 9.x keyboard definitions do not have precedence when a native Mac OS X (Carbon or Cocoa) application is in the foreground.

Mac OS X 10.0: Software Update Privileges and Password Issue

If your Admin user password contains spaces, you may encounter privileges/permissions "errors" when installing software.
This article has been archived and is no longer updated by Apple.

Symptom

When installing software, you see an alert with a message stating that there has been an error due to permissions or privileges.

Solution

1. Choose System Preferences from the Apple menu.
2. Click Users.
3. Select your Admin user.
4. Click Edit User.
5. Create a new password that does not contain spaces.
6. Click OK.

Important: In addition to spaces, certain characters may produce unexpected results when used in a password. Generally, these characters are those you type with the Option key.

Published Date: Oct 7, 2016

Mac OS X 10.0: Software Update 1.3.1, 10.0.1 Update, and Epson Printer Driver Update Provide Feature Enhancement, Address Issues

Install Software Update 1.3.1, 10.0.1 Update, and the Epson Printer Driver Update for best system performance.
This article has been archived and is no longer updated by Apple.
Install these software updates for the best Mac OS X performance and feature set:

- Software Update 1.3.1
- 10.0.1 Update
- Epson Printer Driver Update

Important: Before you install, read these notes.

1. You must have an Admin user password to install this update. The password must not contain spaces and may not be blank. Certain characters may also produce unexpected results when used in a password. Generally, these characters are those you type with the Option key. To change your password, open System Preferences and click Users. Select an Admin user and click Edit User. Create a new password. For best security, put both numbers and letters within the first eight characters of the password.

2. You may experience unexpected results if you have installed third-party modifications to system software or if you have modified the operating system through other means, such as the Terminal. This precautionary statement does not apply to the normal installation of application software.

3. Do not interrupt the 10.0.1 Update installation process. You can monitor progress by clicking the Detailed Progress disclosure triangle. When viewing Detailed Progress, it is normal for the update to say "optimizing" for several minutes prior to completion. If you experience a power outage or other interruption during a software update installation, you should download the update from **Apple Software Updates** and reinstall it. "Optimizing" refers to the execution of a process called "update_prebinding," which allows applications to open faster by precalculating the address information of system data the applications use. This optimization is performed on the Mac OS X startup disk when Apple updates certain System components. Though update_prebinding may be executed manually, it is not necessary to use it at any other time.

Steps to install the updates

(You must first be connected to the Internet.)

1. Quit open applications, which are marked in the Dock with a small triangle. You cannot quit the Finder.
2. Choose System Preferences from the Apple menu.
3. Click the Software Update icon.
4. Click Update Now.

You may now install Software Update 1.3.1. You must install this update first to access the 10.0.1 Update, the Epson Printer Driver Update, and any future updates using the Software Update pane in System Preferences.

Repeat the steps above to install the 10.0.1 Update. Restart your computer after installing the 10.0.1 Update and repeat steps again to install the Epson Printer Driver Update.

About the Updates

Software Update 1.3.1

Software Update 1.3.1 includes enhancements to the Mac OS X Software Update engine, including:

- resumable downloads
- ability to work with proxy connections
- interface improvements

10.0.1 Update

This update delivers various enhancements to Mac OS X 10.0. It appears in the Software Update pane only after you install Software Update 1.3.1. After you install this update, the About This Mac window available in the Apple menu reflects the change.

This update may also be obtained from Apple Software Updates (http://www.apple.com/swupdates/).

Enhancements include:

- Improved functionality with iTunes.
- Improved compatibility with third-party USB and FireWire devices.
- Ability to make SSH connections.
- Classic environment refinements.
- Enriched compatibility with AFP (AppleTalk/AppleShare) volumes.

Epson Printer Driver Update

Install this update if you use an Epson USB ink jet printer with Mac OS X.

This update may also be obtained from Apple Software Updates (http://www.apple.com/swupdates/).
Published Date: Oct 7, 2016

Mac OS X: About Remote Login, OpenSSH, and Telnet

With Mac OS X 10.0.1 or later, your computer uses OpenSSH for remote login instead of telnet, rlogin, and rsh services. If you have a specific need for telnet, it may be re-enabled as explained below.
This article has been archived and is no longer updated by Apple.
The Sharing pane of System Preferences includes a checkbox for "Allow remote login." Installing the Mac OS X 10.0.1 Update (no longer available) or a later version of system software on your computer changes the behavior of remote login.

Mac OS X 10.0 behavior

Enabling the "Allow remote login" option turns on telnet, rlogin (remote login), and rsh (remote shell) services. You can then connect remotely to your computer by using a client application for any of these services.

Mac OS X versions 10.0.1 to 10.1 and later

Enabling the "Allow remote login" option turns on OpenSSH service. You can then connect remotely to your computer by using an SSH client application. Mac OS X 10.0.1 provides OpenSSH-2.3.0p1. For more information on OpenSSH, open the Terminal utility and type "`man ssh`" after the prompt.

Notes:

1. To install a software update, choose System Preferences from the Apple menu and click the Software Update icon. You may check for updates manually or on a schedule.

2. If you have installed an open source version of OpenSSH, the 10.0.1 Update will overwrite it. This may apply to later versions of system software.

3. Depending on system software version, you may experience a delay when you enable the "Allow remote login" option. The delay is due to the time it takes to start up the OpenSSH service. Click the checkbox only once. Clicking multiple times may result in the box appearing checked even if the service is off. You may correct this symptom either by restarting the computer or by using the Terminal utility to delete the file `/var/run/sshd.pid`.

Enabling telnet, rlogin, and rsh in Mac OS X 10.0.1 and later

Important: Telnet, rlogin, and rsh send information (including passwords) over the network unencrypted. OpenSSH provides greater security. You should only revert to telnet, rlogin, and rsh if your network environment requires them.

You must be logged in as an Admin user to follow these steps. After each step in which you type a command, press the Return key.

1. Open the Terminal utility.
2. Type `sudo pico /etc/inetd.conf`
3. Type in your admin password.
4. Press Return.
5. The file inetd.conf will open in the pico text editor. Using the arrow keys to navigate, scroll down until you see the lines for:
#telnet
#shell
#login
6. Remove the pound "#" character from the line of each service you want to re-enable.
7. Save the file (press Control-O), press Return, and exit pico (press Control-X).
8. Choose Restart from the Apple menu.

When the computer has restarted, the services you enabled should be available.

Mac OS X: Cannot Use Mac OS 9 Software Update Control Panel in Classic

The Classic environment of some Mac OS X versions (10.0 to 10.0.4 and 10.2 or later) does not allow use of the Mac OS 9 Software Update control panel, and the Software Update pane of System Preferences does not update Mac OS 9 system software.
This article has been archived and is no longer updated by Apple.

Symptom

Mac OS X 10.0 to 10.0.4 **and** 10.2 and later:

If you try to use the Software Update control panel within the Classic environment, an alert box appears with this message:

> "That application or control panel is not supported by Classic."

Mac OS X 10.1 to 10.1.5:

The Software Update control panel opens within the Classic environment. It reports that your software is up to date, but that is not necessarily accurate.

Solution

Restart the computer from Mac OS 9 to use the Software Update control panel. After updating your software, switch the startup System Folder back to Mac OS X. For more information about changing the startup operating system, see article 106667, "**How to Switch Between Mac OS 9 and Mac OS X**".
Published Date: Oct 7, 2016

Mac OS X 10.0: Classic Does Not Work From a UFS Disk on First Use

When Mac OS X 10.0 is installed on a disk or disk partition that uses the UNIX File System (UFS) format, use the steps in this article to open the Classic environment for the first time.
This article has been archived and is no longer updated by Apple.

Symptom

The Classic environment does not open.

Solution

To use Classic, you must already have Mac OS 9.1 installed on a separate volume that uses the Mac OS Extended (HFS Plus) format. This issue is resolved in Mac OS X 10.1 and later.

For affected Mac OS X versions, follow these steps to open the Classic application for the first time:

1. Log in to Mac OS X as an Admin user.
2. Choose Go To Folder from the Go menu.
3. Type `/System/Library/CoreServices`
4. Click Go.
5. Drag the item Classic Startup to the OS 9.1 Volume.
6. Open the Terminal utility.
7. Type `cd /Volumes/HFSvolume/Classic\\ Startup.app/Contents/Resources`
Note: In place of "HFSvolume," type the exact name of your Mac OS 9.1 volume.
8. Press Return.
9. Type `chmod u+s TruBlueEnvironment`
10. Press Return.
11. Type `sudo chown root TruBlueEnvironment`
12. Press Return.
13. Enter your Admin user password at the prompt and press return.
14. Quit Terminal
15. Open "Classic Startup" from the Mac OS 9.1 volume.
16. Click OK when prompted to add Resources.

Note: You only need to open Classic from the HFS Plus volume the first time that you use it with a specific Mac OS 9.1 System Folder. This allows Classic to install required components into the Mac OS 9.1 System Folder. Classic opens normally from the original copy on the UFS volume on subsequent use. If you change the Classic startup volume or remove the components installed by Classic, you must open the copy of Classic that you have installed on the HFS Plus volume.

Mac OS X 10.0: "You are running Classic without superuser (root) Privileges" Message

An alert box with a message about "superuser" privileges appears when attempting to open Classic under a certain circumstance.
This article has been archived and is no longer updated by Apple.

Symptom

As Classic begins to open, an alert box appears with the message:

> "You are running classic without superuser (root) Privileges. Ensure that TruBlueEnviroment is setuid and owned by root, or re-install Classic".

Note: For other versions of Mac OS X, see these related technical documents:

106639: "**Mac OS X 10.1: You are running Classic without superuser (root) Privileges' Message**"
106584: "**Mac OS X 10.2: You are running Classic without superuser (root) Privileges' Message**"

Solution

This happens if you select the checkbox for "Ignore privileges on this volume" in the Show Info window for the Mac OS X startup volume, and attempt to use Classic without first restarting the computer. Either restart the computer or deselect this checkbox to use Classic.

Important: If you don't have a specific need to ignore privileges, you should not use that option. Your computer is more secure when privileges are active.

Mac OS X 10.0: Deselect the PPP "Wait for Dial Tone" Option in Italy

A computer in Italy may not make a PPP connection if the option to "Wait for dial tone before dialing" is enabled.
This article has been archived and is no longer updated by Apple.

Symptom

When attempting a PPP connection, an alert box with this message appears:

> "PPP Connect Error. No dial tone detected. Check phone line connection and try again."

Solution

This occurs when a modem in the nation of Italy encounters a nonstandard dial tone or line signal.

Note: Updating to Mac OS X 10.1 resolves this issue.

Users of Mac OS X versions 10.0 to 10.0.4 may follow these steps to ignore the dial tone:

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. Set the Configure pop-up menu to Internal Modem.
4. Click the Modem tab.
5. Be sure that the option for "Wait for dial tone before dialing" is not selected.

Mac OS X 10.0: Setup Assistant Does Not Accommodate DSL User Name and Password

The Mac OS Setup Assistant used during the installation process does not allow you to set up a user name and password for connecting to the Internet via DSL.
This article has been archived and is no longer updated by Apple.

Symptom

The DSL option in the Setup Assistant only allows for DHCP and BootP.

Solution

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. Click the PPPoE tab.
4. Click the checkbox to select the "Connect using PPPoE" option
5. Enter the information required by your DSL Internet service provider.

Mac OS X: Using LocalTalk Hardware and Serial Port Devices

This document provides an overview of when Mac OS X will and will not work with serial port devices and LocalTalk-based hardware.

This article has been archived and is no longer updated by Apple.

LocalTalk Hardware

Mac OS X does not work with LocalTalk hardware. A third-party Ethernet-to-LocalTalk adapter may allow you to use your LocalTalk device with Mac OS X. You can find such adapters at the Macintosh Products Guide. Check the third-party manufacturer's specifications for Mac OS X compatibility.

Alternatively, you can restart the computer with Mac OS 9.1 to use a LocalTalk device.

For more information, see technical document106170: "**Mac OS X 10.0: Classic Does Not Allow Direct Hardware Networking Access**."

Note: LocalTalk (hardware) should not be confused with AppleTalk (a networking protocol). You can use AppleTalk devices with Mac OS X, as long as they are not connected to an external serial port with LocalTalk hardware.

Serial Port-Based Modems

Mac OS X is compatible with serial port-based modems and PPP connections. Serial port-based modems work with PPP applications such as Mail and Microsoft Internet Explorer, both natively and in the Classic environment. Use the Mac OS X Internet Connect application to make the PPP connection if needed, but afterwards you may use a Classic PPP application successfully.

Classic (non-PPP) modem software, such as a Classic fax application or a terminal emulation application, will not work. If you need to use this software, start up with Mac OS 9.1.

Other Serial Port-Based Hardware

Other hardware devices that use a serial port do not work in the Mac OS X Classic environment, but they may work in the native Mac OS X environments. Verify compatibility of the hardware in question with the product's manufacturer.

If you use a device that adds a serial port to a computer that did not originally come with one (such as a GeeThree Stealth Serial Port, or Griffin Technology gPort or CubePort), you should verify compatibility information of the device with the manufacturer.

Mac OS X 10.0: Webdings and Zapf Dingbat Fonts Do Not Work in TextEdit

TextEdit does not correctly recognize the Webdings and Zapf Dingbats fonts.
This article has been archived and is no longer updated by Apple.

Symptom

After selecting Webdings or Zapf Dingbat, you get an unexpected font choice (Hiragino Kaku Gothic Pro W3).

Solution

This is a known issue for this version of software.

Mac OS X 10.0: Menu Bar Clock Can Obscure Other Menu Bar Items

If menus enter the space of the menu bar clock, the clock appears in the foreground, obscuring the menus.
This article has been archived and is no longer updated by Apple.

Symptom

The menu bar clock is drawn over a menu.

Solution

The menu bar clock can obscure menus of an application if the application places enough menus in the menu bar to extend into the clock's space. The lower your display resolution, the greater the possibility that this will occur. To address this, you may either increase display resolution or turn off the menu bar clock. Choose System Preferences from the Apple menu to perform either of these tasks.
Published Date: Feb 17, 2012

Mac OS X: IP Configuration "in use by" Message, Networking Disabled

Assigning an IP address that is already in use disables TCP/IP networking.
This article has been archived and is no longer updated by Apple.

Symptom

Network services become unavailable to the computer you are setting up. You may see an alert box with a message that says (Figure 1):

"IP Configuration <IP Address> is in use by <MAC Address>"

Figure 1 Duplicate IP address message

Solution

In the Network pane of System Preferences, assign an IP address that is not in use. Consult your network administrator if you have questions about an appropriate IP address. If connectivity is not restored after saving your change in System Preferences, then either restart the computer or unplug and replug the Ethernet cable.

You can also resolve the IP address conflict by locating the other device using the affected IP address, then either reconfiguring it or disconnecting it from the network. After you do this, you may need to switch your computer to a different configuration, save it, then switch back to the original IP address in order for the changes to take effect.

Mac OS X 10.0: Software Update, Mac Help, or Sherlock "is not able to connect to the Internet" Message

Connect first to www.apple.com to resolve a particular situation in which Software Update, Sherlock, or Mac Help fails to connect.
This article has been archived and is no longer updated by Apple.

Symptom

You computer is clearly connected to the Internet, but an alert box with this message appears when you attempt to use the Software Update control panel in Mac OS X:

> "Software Update is not able to connect to the Internet."

A similar message may appear for Sherlock or when using Mac Help to connect to the Internet.

Solution

You can work around this by connecting to www.apple.com in a Web browser before using Software Update, Sherlock, or Mac Help.

Alternatively, you could use the Network Utility included with Mac OS X to ping www.apple.com before using them.

Your Internet service provider or network administrator provides a DNS server that converts names like "apple.com" into their numerical IP addresses. Apple has identified certain DNS servers that may provide Software Update with an unexpected response, producing the alert described above.

Installing the Mac OS X 10.0.2 Update will prevent this issue.

Macintosh Manager: The Managed Preference Model

This document describes how to use Managed Preferences in Macintosh Manager.
This article has been archived and is no longer updated by Apple.

1. An Overview of the Preference Model

The Managed Preference model was first included in Macintosh Manager version 1.3 to allow greater control and management of user preferences.

Note: Some system-specific preferences are not affected by the Managed Preference model.

Preference Storage

When a user logs in to Macintosh Manager, preferences specific to that user are accessed and used by the client computer. Mac OS 9 clients differ from Mac OS 8.6 and earlier clients in where these preferences are stored while a user is logged in.

Important: This document does not discuss how preferences are handled when "Startup Disk" is selected as the location where documents are stored for a workgroup in the Workgroups: Options pane of the Macintosh Manager admin application. For more information on this behavior, please see technical document 106932, "**Macintosh Manager: Managed Preference Behavior When Group Documents Volume is the Startup Disk**".

When logged in to Macintosh Manager

Mac OS 8.6 and earlier clients automatically copy user-specific preferences from the server to the local workstation when a user logs in. These preferences are accessed locally during the Macintosh Manager session. When the user logs out, the preferences may or may not be copied back to the server, depending on the configuration.

By default, Mac OS 9 clients access the preferences files on the server over the network during the Macintosh Manager session.

When logged out of Macintosh Manager

By default, both Mac OS 9 clients and Mac OS 8.6 and earlier clients store user preferences on the server when a user is not logged in.

Preference Model Components

The Preference Model allows you to group preferences into three special categories: Initial Preferences, Forced Preferences, and Preserved Preferences. The first two categories work with Mac OS 9 client computers, and all three categories can be used with Mac OS 8.6 and earlier clients.

The Macintosh Manager Server extension automatically creates a folder called Managed Preferences on the server the first time any user whose preferences will be stored on the server logs in. By default, this Managed Preference folder is created in the Macintosh Manager shared folder on the server. Inside this folder are the three folders needed for the new preference model to function: Forced Preferences, Initial Preferences, and Preserved Preferences.

Figure 1 Managed Preferences folder

2. Initial Preferences

The Initial Preferences folder allows a user to receive preconfigured preferences the first time she opens an application that uses those preferences. The Initial Preferences folder only gives the user any specific preference file once. If a user already has the preference file in her own preference folder, Macintosh Manager will not replace her copy of the preference file with the copy in the Initial Preferences folder. This process is repeated each time a user logs in, so you can place additional preference files in the Initial Preferences folder later if you install additional software. When a user opens the new software for the first time, a copy of the preference files for the new software will be placed in her Preferences folder.

There are also some preference files and folders that get created when a user logs in for the first time, whether or not the Preference Model is active. These items include, but are not limited to:

- Apple Menu Options Prefs
- Internet Preferences
- Keyboard Preferences
- Keychains (a folder)

- Mac OS Preferences
- TSM Preferences
- Location Manager Prefs (a folder)
- AppSwitcher Preferences
- User Prefs

These files and folders are created during the client startup process before the Preference Model runs. Files and folders in the Initial Preferences folder matching any of these items are therefore not copied. Note: Aliases and invisible files placed in the Initial Preferences folder will not work, and should not be used.

Usage Example

The following is an example of how the Initial Preferences can be used to provide all users with preconfigured bookmarks and preferences for Internet Explorer the first time they log in.

Setup

1. On your administration computer, set up bookmarks and preferences in Internet Explorer that you want all your users to have the first time they log in to Macintosh Manager.
2. Copy the entire Explorer folder from the Preferences folder in the System Folder of your administration computer to the Initial Preferences folder on the Macintosh Manager server.

Implementation

Mac OS 9 client

1. A Macintosh Manager user logs in to a client computer.
2. The Macintosh Manager server scans the Initial Preferences folder and detects a folder named Explorer.
3. The Macintosh Manager server scans for a folder named Explorer in the user-specific Preferences folder in the Users folder on the document storage sharepoint for the user's workgroup.
4. If Macintosh Manager does not detect a folder named Explorer there, Macintosh Manager copies the Explorer folder and the files and folders within it to that location.
5. If Macintosh Manager detects a folder named Explorer, neither the Explorer folder nor any of the files inside it is copied.

Mac OS 8.6 and earlier client

1. A Macintosh Manager user logs in to a client computer.
2. The Macintosh Manager server scans the Initial Preferences folder and detects a folder named Explorer.
3. The Macintosh Manager server scans for a folder named Explorer in the user-specific Preferences folder in the Users folder on the document storage sharepoint for the user's workgroup.
4. The Macintosh Manager server also scans for a folder named Explorer in the Preferences folder in the System Folder on the client computer.
5. If Macintosh Manager does not detect a folder named Explorer in either or both of the locations, it copies the Explorer folder in the Initial Preferences folder to either or both locations where an Explorer folder is not already present.
Note: If an Explorer folder already exists in one location, but not the other, the Explorer folder in Initial Preferences is only copied to the location where an Explorer folder does not already exist. This can lead to an inconsistent user experience from one client computer to another.

Figure 2 Initial Preferences logic process

3. Forced Preferences

The Forced Preferences folder forces a user to receive the same preference file or folder of files every time he logs in on any Macintosh Manager client computer. The items in the Forced Preferences folder will replace items with the same names in the Preferences folder the user will be using regardless of whether he has newer or older items. For Mac OS 9 clients, the items in the Forced preferences are copied to the user-specific Preferences folder in the Users folder in the Macintosh Manager folder on the server. For Mac OS 8.6 and earlier clients, Macintosh Manager copies the file only to the Preferences folder in the System Folder of the client computer. It does not copy them to the user-specific Preferences folder on the server.
Note: Aliases and invisible files placed in the Forced Preferences folder will not work, and should not be used.

Usage Example

The following is an example of how the Forced Preferences can be used to provide all users with preconfigured bookmarks and preferences for Internet Explorer every time they log in.

Setup

1. On your administration computer, set up bookmarks and preferences in Internet Explorer that you want all your users to have every time they log in to Macintosh Manager.
2. Copy the entire Explorer folder from the Preferences folder in the System Folder of your administration computer to the Forced Preferences folder on the Macintosh Manager server.

Implementation

Mac OS 9 client

1. A Macintosh Manager user logs in to a client computer.
2. The Macintosh Manager server scans the Forced Preferences folder and detects a folder named Explorer.
3. The Macintosh Manager server scans for a folder named Explorer in the user-specific Preferences folder in the Users folder on the document storage sharepoint for the user's workgroup.
4. If Macintosh Manager does not detect a folder named Explorer there, Macintosh Manager copies the Explorer folder from the Forced Preferences folder on the server to that location. If Macintosh Manager detects an Explorer folder there, Macintosh Manager updates the existing folder, replaces older files with newer files that have the same names, and adding any files that you've put in the Forced Preferences folder since the last time the client logged in. If there are files or folders in the user's Preferences folder with unique names that don't match files in the Forced Preferences folder, Macintosh Manager does nothing to them. If you have concerns about these files accumulating and consuming disk space, check the user's Preferences folder as often as you think necessary to prevent this.

Mac OS 8.6 or earlier client

1. A Macintosh Manager user logs in to a client computer.
2. The Macintosh Manager server scans the Forced Preferences folder and detects a folder named Explorer.
3. The Macintosh Manager server scans for a folder named Explorer in the Preferences folder in the System Folder on the client computer.
4. If Macintosh Manager does not detect a folder named Explorer there, Macintosh Manager copies the Explorer folder from the Forced Preferences folder on the server to that location.
5. If Macintosh Manager detects an Explorer folder there, Macintosh Manager updates the existing folder, replaces older files with newer files that have the same names, and adding any files that you've put in the Forced Preferences folder since the last time the client logged in. If there are files or folders in the user's Preferences folder with unique names that don't match files in the Forced Preferences folder, Macintosh Manager does nothing to them. If you have concerns about these files accumulating and consuming disk space, check the user's Preferences folder as often as you think necessary to prevent this.

Figure 3 Forced Preferences logic process

4. Preserved Preferences

The Preserved Preferences folder allows an administrator to set the preferences that are copied between the server and Mac OS 8.6 or earlier clients during login and logout. Important: This portion of the preference model is only applicable to Mac OS 8.6 or earlier client computers. The Preserved Preference portion of the preference model behaves differently than the Initial Preferences and Forced Preferences in that the files and folders you put in the Preserved Preferences folder are never actually copied. Macintosh Manager scans the files and folders in the Preserved Preferences folder, and builds a list containing the names of all the items inside. Macintosh Manager then uses this list to determine which preferences need to be copied back and forth from the server to the client computer during login and logout instead of copying the entire contents of the Preferences folder. You can use the Preserved Preferences folder to decrease login and logout time by limiting the amount of preferences that are copied.
Note: Aliases and invisible files placed in the Preserved Preferences folder will not work, and should not be used.

There are some preferences that are always copied, whether or not they exist in the Preserved Preferences folder and some that are never copied, even if they exist in the Preserved Preferences folder:

Always Copied Preferences	Never Copied Preferences

Appearance Preferences	Energy Saver Preferences
Control Strip Preferences	AppleTalk Preferences
Date & Time Preferences	ColorSyncTM Profiles
Finder Preferences	Desktop Picture Prefs
Mac OS Preferences	Extensions Manager Preferences
Panels Preferences	Client Prefs
User Prefs	TCP/IP Preferences
	Multi-User Items
	Multi-User Prefs
	Remote Access
	Open Transport Preferences
	Users & Groups Data File
	Network Assistant Preferences

When a user logs in on a Mac OS 8.6 or earlier client computer, Macintosh Manager builds a list of the names of the files and folders inside the Preserved Preferences folder. Macintosh Manager adds the names of the items in the 'Always Copied' list, creating a combined list. Macintosh Manager compares the combined list against the items in the user-specific Preferences folder on the server. Macintosh Manager then copies all the files and folders whose names exist on the combined list from the user-specific Preferences folder on the server to the local system's Preferences folder. Any files or folders that are already in the local Preferences folder that have the same name as those listed in the combined list are deleted. If an item on the list does not exist in either location, the item is skipped.
Note: Any item that has the same name as an item in the Forced Preferences folder is removed from the list, and is not copied.

Figure 4 Preserved Preferences logic process

When the user logs out, the same process runs to determine which preferences are copied from the local system's Preferences folder back to the user's server based Preferences folder. All items matching those on the combined list are then deleted from the Preferences folder on the client computer. Note: A user who then logs in using a System Access workgroup may not be able to use some applications, because the preferences for the applications do not exist in the Preferences folder.

5. Administration of the Managed Preference Model

Creation of the Managed Preferences folder

The Managed Preferences folder, and the three folders within it are created automatically by Macintosh Manager the first time any member of a workgroup logs in. Note: The folder is created in the same folder as the Users folder at the workgroup document sharepoint. This sharepoint is designated in the Options sub tab under the Workgroups tab in the Macintosh Manager administration application. The default location is the Macintosh Manager folder on the server.

Activation of the Managed Preference Model

The Managed Preferences model is made active when any item is placed in one of the three folders in the Managed Preferences folder. "Copy only Internet preferences or administrator defined preferences" must be selected under the Security tab which is under the Global tab in the Macintosh Manager administration application for the Preserved Preferences portion of the Managed Preferences model to function.

Using Multiple Managed Preferences Folders

Each workgroup uses the Managed Preferences folder on the workgroup documents volume for that workgroup. Different workgroups can use different sets of Managed Preferences only if they use different workgroup document locations. Conversely, in order to use the same Managed Preferences folder for workgroups with different workgroup documents locations, the Managed Preferences folder must be copied to each workgroup documents location.

Mac OS X: Using AppleTalk With PPPoE

Follow the steps in this document to use AppleTalk and PPPoE on the same Ethernet port.
This article has been archived and is no longer updated by Apple.

Symptom

If you are connected to the Internet with PPPoE and try to turn on AppleTalk at the same time, a message appears in the AppleTalk pane that says:

> "AppleTalk cannot be used with PPPoE. To use AppleTalk, select the Advanced pane and create a new Ethernet configuration."

Note: This does not affect your computer in two circumstances.

1. Your computer connects to an AirPort Base Station or other router that has already made the actual PPPoE connection. Your computer is not in a direct PPPoE connection, so you should not have selected the PPPoE checkbox.
2. You enable AppleTalk and PPPoE on two different network interfaces, such as AirPort and Ethernet.

Solution

You can create multiple configurations of the Ethernet port to allow access to AppleTalk.

Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. If you are not logged in to Mac OS X as an Admin user, click the padlock to enter an Admin user name and password.
4. Choose Active Network Ports from the Show pop-up menu.
Note: Some names have changed. For versions prior to Mac OS X 10.1, choose Advanced from the Configure pop-up menu.
5. Click Built-in Ethernet to select it.
6. Click Duplicate.
7. Rename the new port configuration, if desired, then click OK.
8. Choose the name of the port configuration you just created/named from the Show pop-up menu.
9. Click the PPPoE tab.
10. Deselect "Connect using PPPoE".
11. Click the AppleTalk tab.
12. Click the checkbox to select Make AppleTalk Active.
13. Click Save.

Macintosh Manager: How to Use QuarkXpress "XTensions" in a Macintosh Manager Environment

Use steps described here to resolve QuarkXpress "XTensions" alert messages in a Macintosh Manager environment.
This article has been archived and is no longer updated by Apple.

Symptom

When starting QuarkXpress on a computer using Macintosh Manager, an alert box appears with this message:

> "Xtensions Loading Error
>
> "The following Xtensions software was unable to load. For more information select the Xtension and click 'About.'"

Figure 1 QuarkXpress alert box

This alert box does not appear when you log in with System Access.

Solution

Some QuarkXpress XTensions must have read and write access to function completely. You can provide this access by moving the QuarkXpress folder into the "Other Applications·" folder. For more information on using and setting up the Other Applications· folder, please see:

Article 75333: "**Macintosh Manager 1.3: Read Me**"

If moving the QuarkXpress folder into the Other Applications· folder does not resolve the issue, follow these steps:

1. Log in to the computer with System Accesss.
2. Open QuarkXpress.
3. Check the XTensions Manager in QuarkXpress to see which XTensions are still reporting an error status.

Figure 2 The QuarkXpress Xtensions Manager

Important: Do not confuse the Mac OS Extensions Manager control panel with the QuarkXpress Xtensions Manager feature.

The XTension that reports an error status (Figure 2) while in System Access is not functioning because it must be updated or replaced. Its error status is not caused by Macintosh Manager. Please contact QuarkXpress (www.quarkxpress.com) for assistance with XTensions that do not load in QuarkXpress.

Mac OS X 10.0: 10.0.3 Update and Before You Install Information

The Mac OS X 10.0.3 Update adds audio CD burning capability to iTunes for Mac OS X, updates system software, addresses issues, and improves performance.

This article has been archived and is no longer updated by Apple.

There are two versions of the update available to bring your computer to Mac OS X v10.0.3:

10.0.3 Update (15 MB)
This update is required if you have not yet applied the 10.0.2 Update.

10.0.3 Update (1.6 MB)
This smaller update is appropriate if you have already installed the 10.0.2 Update.

Note: The 10.0.2 Update is no longer available from Apple. You should use the 10.0.3 Update instead of 10.0.2.

There are two ways to get a 10.0.3 Update:

1. Open System Preferences and use the Software Update feature. When you click Update Now, the Software Update pane automatically displays the correct version of the 10.0.3 update for your computer.

2. Download the standalone installer from Apple Software Updates (http://www.apple.com/swupdates/). Only the 10.0.3 Update (15 MB) is available here.

Important: Read Before Installing

1. You must have an Admin user password to install this update. The password must not contain spaces and may not be blank. Certain characters may also produce unexpected results when used in a password. Generally, these characters are those you type with the Option key. To change your password, open System Preferences and click Users. Select an Admin user and click Edit User. Create a new password. For best security, put both numbers and letters within the first eight characters of the password.

2. The Software Update pane in System Preferences will only display other updates after Software Update 1.3.1 has been installed.

3. Mac OS X 10.0 and either the 10.0.1 or 10.0.2 Update must be installed before a 10.0.3 Update.

4. You may experience unexpected results if you have installed third-party modifications to system software or if you have modified the operating system through other means, such as the Terminal. This precautionary statement does not apply to the normal installation of application software.

5. The 10.0.3 Update installation process should not be interrupted. You can monitor progress by clicking the Detailed Progress disclosure triangle. When viewing Detailed Progress, it is normal for the update to say "optimizing" for several minutes prior to completion. If you experience a power outage or other interruption during a software update installation, you should download the standalone installer from Apple Software Updates and reinstall it. "Optimizing" refers to the execution of a process called "update_prebinding," which allows applications to open faster by precalculating the address information of system data the applications use. This optimization is performed on the Mac OS X startup disk when Apple updates certain system components. Though update_prebinding may be executed manually, it is not necessary to use it at any other time.

Steps to install the updates using Automatic Software Update

(You must first be connected to the Internet.)

1. Quit open applications, which are marked in the Dock with a small triangle. You cannot quit the Finder.
2. Choose System Preferences from the Apple menu.
3. Click the Software Update icon.
4. Click Update Now.

Note: If you have not yet installed Software Update 1.3.1, you must do so to access other updates using the Software Update feature of System Preferences. After installing Software Update 1.3.1, repeat the above steps to install the 10.0.1 Update (if needed), followed by a 10.0.3 Update.

About the Update

10.0.3 Update Enhancements

This update delivers various enhancements to Mac OS X (10.0.1). Enhancements delivered with the 10.0.3 Update include:

- Enhances iTunes (for Mac OS X) to allow audio CD burning when used with Apple and compatible third-party CD-RW drives.
  Note: You must download iTunes 1.1.1 or later to use this feature. iTunes 1.1.1 is available by the same methods as the 10.0.3 Update.
- Ensures full visibility of file lists in directories that contain a large number of items.
- Improved compatibility with third-party USB and FireWire devices.
- Classic environment refinements.
- Enriched compatibility with AFP (AppleTalk/AppleShare) volumes.
- Enhanced optimization process.
- Improved reliability of PPP connections on certain computers.
- Refined performance of certain file and folder types in the Finder.
- Enriched recognition of display resolution choices.
- Enhancements to the Mail application.
- Heightened functionality of the Login window.
- Refined audio performance on certain computers.
- Improved performance of ColorSync with certain printers.
- Favorites are now easier to use.
- Enriched functionality of the Connect To command.
- Enhanced performance when connecting to certain types of servers.
- Refined compatibility with displays that are connected to certain types of ATI display cards.

Mac OS X 10.x, Mac OS 9.x: Info Comments Do Not Appear

Mac OS X and Mac OS 9.x do not display each others Info window comments.
This article has been archived and is no longer updated by Apple.

Symptom

Comments that you typed in the Info window for an item do not appear.

Solution

The Get Info command in the Mac OS 9 Finder and the Show Info command in the Mac OS X Finder both open an Info window that displays various facts about the selected item. The Info window also has a Comments field in which you can type notes about the selected item.

Mac OS 9 and Mac OS X store file Comments separately. Comments entered in the Info window when started up from Mac OS 9 do not appear in the Info window when started up from Mac OS X (and vice versa).

This is a known behavior of Mac OS 9 and Mac OS X and does not indicate any issue with your computer's software.

Mac OS 9.1: Conflict Between CarbonLib 1.3.1 and AppleScript

Using AppleScript with CarbonLib 1.3.1 installed can cause the computer to stop responding.
This article has been archived and is no longer updated by Apple.

Symptom

1. The computer stops responding ("freezes") after you click the record button in the AppleScript Script Editor.

2. The computer stops responding when you (or an application) execute an AppleScript. This includes the Browse the Internet, Mail, and Register with Apple icons on the desktop.

Solution

Download and install Carbonlib 1.4 or later. You can obtain this update either through the Software Update control panel or by visiting the Apple Software Downloads page (http://www.apple.com/swupdates/).
Published Date: Feb 18, 2012

Macintosh Manager 1.4.1: Microsoft Word "insufficient memory" Message

You can update Mac OS 9.1 computers to Mac OS 9.2.1 to resolve an issue in which Microsoft Word produces an "insufficient memory" alert message when used with Macintosh Manager 1.4.1.
This article has been archived and is no longer updated by Apple.

Symptom

When using a Macintosh Manager client with Microsoft Word 98 or Word 2001, an alert box appears with this message:

> "Word cannot open the document. Try one of more of the following: On the File menu, click Open to open the document. Make sure the document is a valid Word document."

Figure 1 Alert box

After clicking OK, an alert box appears with this message:

> "There is insufficient memory or disk space. Close extra windows and save your work."

Figure 2 Alert box

When you click OK in the second alert box, it reappears. It will reappear indefinitely until you force restart the computer using the power or reset button.

with this software:

- Mac OS 9.1
- Macintosh Manager 1.4.1
- Microsoft Word 98 or 2001
- Restricted Finder or Panels Environment

Solution

Install Mac OS 9.2.1.
Published Date: Feb 17, 2012

Mac OS X 10.0: Internet Explorer 5.1 Preview Update and Before You Install Information

This update installs a feature-enhanced version of Microsoft Internet Explorer 5.1 Preview that resolves certain issues.
This article has been archived and is no longer updated by Apple.
To get the updated version of Internet Explorer 5.1 Preview, use the Automatic Software Update feature of Mac OS X. This update installs the complete Internet Explorer application (in the Applications directory), and does not require that a previous version be present.

Notes: Important - Read Before Installing

1. This updated version of Internet Explorer 5.1 Preview has the same name as the version that shipped with Mac OS X 10.0. You can verify a successful installation by choosing About Internet Explorer from the Explorer application menu. In the "About" window, version number 5.1b1 (3408) means that this update is installed.

   Microsoft Internet Explorer 5.1b1 (5502) Preview was originally included with Mac OS X. However, version 3408 is newer than version 5502.

   You may also verify installation with Show Info. Navigate to the Internet Explorer application, located in the Internet Explorer folder, which is installed by default in the Applications directory. Select the icon and choose Show Info from the File menu. 'Version:' states 'Internet Explorer 5.1.1 for Mac'.

2. You must have an Admin user password to install this update. The password must not contain spaces and may not be blank. Certain characters may also produce unexpected results when used in a password. Generally, these characters are those you type with the Option key. To change your password, open System Preferences and click Users. Select an Admin user and click Edit User. Create a new password. For best security, put both numbers and letters within the first eight characters of the password.

3. Mac OS X 10.0.3 and Software Update 1.3.1 must be installed before this update will appear in your Software Update control pane. For more information on the 10.0.3 Update and the Software Update 1.3.1 Update, please see:

   Article 106300: "**Mac OS X 10.0: 10.0.3 Update and Before You Install Information**"
   Article 106271: "**Mac OS X 10.0: Software Update 1.3.1, 10.0.1 Update, and Epson Printer Driver Update Provide Feature Enhancement, Address Issues**"

4. A standalone installer is not available from Apple Software Updates.

Steps to install the Internet Explorer 5.1 Preview using Automatic Software Update

(You must first be connected to the Internet.)

1. Quit open applications, which are marked in the Dock with a small triangle. You cannot quit the Finder.
2. Choose System Preferences from the Apple menu.
3. Click the Software Update icon.
4. Click Update Now.

About this Update: Internet Explorer 5.1b1 (3408) Enhancements

This update delivers various enhancements to Microsoft Internet Explorer 5.1 Preview:

- Carbon and Cocoa helper applications now open in lieu of equivalent Classic helper applications, when available.
- Improved reliability when copying from or pasting in to a browser window.
- The Print Preview function now properly scales large printing previews to the current display resolution.
- File URLs ("file://") now work better with POSIX directory paths.
- Local Java applets that use POSIX will now perform as expected.
- Eliminated a potential issue if a "file://" URL referred to a nonexistent file on a local volume.
- Enhanced reliability when navigating from one search engine to another using the Next button.
- More choices are offered to view a downloaded PDF file.
- Visible Java applets will still work after clicking outside the Internet Explorer browser window.
- Reduced occurrences of "polling" (the color disc mouse cursor is visible and the browser is temporarily unresponsive).
- Java applets that appear inside an HTML frame are now positioned more accurately.
- Increased compatibility with Java-based games, such as Yahoo Games.
- Java applets from a previous Web page no longer appear after visiting a new Web page.
- The Web site http://www.sun.com/java/ now works as expected.

- New QuickTime and Macromedia Flash plug-ins are installed for use with Internet Explorer 5.1 Preview.
- The Back, Next, and Refresh button icons now work as expected in the Spanish localized version.

Published Date: Feb 19, 2012

Darwin: Streaming Proxy Read Me

This Read Me discusses the use of Streaming Proxy.
This article has been archived and is no longer updated by Apple.
The Darwin Streaming Proxy is an application-specific proxy that would normally be run in a border zone or perimeter network. It is used to give an intranet access to external streaming servers when a firewall would otherwise block RTSP connections or RTP/UDP data flow. The network is usually set up to allow:

- RTSP connections from within the network, as long as the destination is the proxy.
- RTSP connections to outside the network, as long as the source is the proxy.
- RTP datagrams to and from the proxy to the inner network.
- RTP datagrams to and from the proxy to the outside.

On the perimeter network, an "inner skin" and "outer skin" may use differing configurations to allow the flows above.

Notes:

1. RTSP runs over TCP, and the normal connection port is 554.
2. If the URL supplied by the client to the proxy includes a port number, then the proxy will attempt to connect to the server using that port number rather than the default 554.
3. RTP runs over UDP, and a range of ports may be used. Client-side ports are usually in a restricted range (starting at 6970), but servers cannot so easily restrict what ports they use. For best results, do not restrict port number access to the proxy; use only the IP address.
4. This proxy handles standard RTSP controlling standard RTP. RTSP can be used to control other media protocols, and a number of companies use it to control proprietary media protocols. This proxy does not attempt to proxy those other protocols. For more information on these protocols, please see:

   To learn more about these specifications, see documentation from the Internet Engineering Task Force and search for the following:
   - Real-Time Streaming Protocol (RTSP) - Article 2326
   - Real-Time Transport Protocol (RTP) - Article 1889

License

The Darwin Streaming Server and Streaming Proxy is distributed under the terms of the Apple Public Source License. For more information, refer to the license terms at http://www.publicsource.apple.com/ . The Apple Public Source License does not allow you to use the terms "QuickTime" or "QuickTime Streaming Server" in descriptions of products developed using Darwin Streaming Server or Streaming Proxy open source code, nor to use any Apple trademarks or logos associated with QuickTime and QuickTime Streaming Server.

How To Use

The application must reside on a computer that can access both the Internet and your intranet. This could be either your bastion host or another computer in your perimeter network. Follow these steps:

1. Install the Streaming Proxy in a reasonable place on your computer, such as: /usr/local/sbin
2. Edit the streamingproxy.conf file and place it in the /etc directory.
3. Launch the StreamingProxy application:
   #/usr/local/sbin/StreamingProxy -c /etc/streamingproxy.conf

Notes:

You can launch the StreamingProxy application using the -h command line option for a description of the other command line options. The root user is required to enable default port 554 for reception.

Setting Up Clients

1. Open the QuickTime Settings control panel.
2. Select Streaming Proxy from the pop-up menu.
3. Click the checkbox to select RTSP Proxy Server.
4. Type in the IP address or domain name of your proxy server in the corresponding field. In the port field, you may enter either the default of 554 or another port that you designated in the streamingproxy.conf file.

How It Works

The Streaming Proxy listens on ports you specify for a RTSP command sequence. It parses the commands and redirects the command to the desired server. It also rewrites the RTSP commands to reflect the new set of port numbers that the proxy must use.

The Streaming Proxy only relays data that comes from a server from which data was requested.

Credits

This proxy includes software developed by the University of California, Berkeley, and its contributors. That included software is the regular expression code developed by Henry Spencer.

QuickTime/Darwin Streaming Server 4: TCP Ports Used

This document lists TCP ports used by version 4 of the QuickTime Streaming Server and Darwin Streaming Server.

This article has been archived and is no longer updated by Apple.

QuickTime Streaming Server 4 and Darwin Streaming Server 4 use the following TCP ports:

- 80: HTTP
- 554: RTSP
- 6970 -9999: used for dynamic (announced) UDP broadcasts
- 7070: RTSP
- 8000, 8001: MP3 streaming
- 10,000-20,000: buffer space
- 20,000-65,535: static SDP default range (user defined)

Published Date: Feb 17, 2012

QuickTime Streaming Server 3: How to Migrate Playlists and Config Files From Earlier Versions

Use these steps to move playlists and broadcast config files from QuickTime Streaming Server versions 1.x and 2.x to version 3.

This article has been archived and is no longer updated by Apple.

Follow these steps to migrate playlists and config files from a previous version of QuickTime Streaming Server:

1. Copy playlist and broadcast config files into this directory (folder):

/Library/QuickTimeStreaming/Playlists/

2. The playlist and broadcast config files need to be named following this convention:

listname.config
listname.playlist

Note: In this example, "listname" represents the name of one of your files. Be sure to use the correct filename suffixes, as shown.

3. The "destination_ip_address" property in the broadcast config file needs to be set as:

destination_ip_address 127.0.0.1

Notes:

1. 127.0.0.1 is a reflexive IP address that refers a computer back to its own IP stack.

2. Streaming Server Admin in QTSS 3.0 only provides administration of playlists that are to be unicast to the QTSS server process that is running on the same computer. The produced SDP file gets copied by default to the movie directory (/Library/QuickTimeStreaming/Movies/).

3. Creating playlists with the Playlists Settings pane in streaming Server Admin uses the RTSP "Announce" feature. It does not by default use the "destination_base_port" designated in the broadcast config file. Rather, the QTSS 3.0 server (reflector) and the 3.0 PlaylistBroadcaster process negotiate an available base UDP port, starting at 6970.

If this port is in use, then the PlaylistBroadcaster process and QTSS server will increment the TCP port by positive, even numbers until an available UDP base port is found (for example: 6972, 6974, 6976).

Playlists created by the Playlist Settings pane in Streaming Server Admin set the default base port to 0. At runtime this prompts the streaming server and broadcaster to auto negotiate a valid and available UDP base port:

destination_base_port 0

4. Streaming Server Admin launches PlaylistBroadcaster processes on the same computer. Because the RTSP "Announce" takes place locally (via 127.0.0.1), there is no need to enter a username or password into the broadcast config file.

Darwin/QuickTime Streaming Server 3: How to Loop With One Movie in Playlist

Use these steps to enable looping when only one movie is in the playlist.

This article has been archived and is no longer updated by Apple.

Using QuickTime Streaming Server 3 or Darwin Streaming Server 3, you can enable looping with a single movie by making **one** of these changes to the default settings:

1. Set the recent_movies_list_size to 0, **or**

2. Set the play_mode to sequential_looped. In this mode, looping will occur regardless what the value is in recent_movies_list_size.

Note: By default, the Playlists Settings pane in the Streaming Server Admin application sets a recent_movies_list_size value of 1. Additionally, the default play_mode is weighted_random. Movies loop when these defaults are present with more than one movie in the playlist. But when you have only one movie in the playlist, it plays once and does not loop.

Darwin/QuickTime Streaming Server 3: Requirements for Skip Protection

Skip protection requires the combination of QuickTime 5 or later client software and QuickTime Streaming Server 3.0 or later, or Darwin Streaming Server 3.0 or later software.

This article has been archived and is no longer updated by Apple.

QuickTime 5 client software includes skip protection. To take advantage of skip protection, a QuickTime 5 client must connect to a server that is using QuickTime Streaming Server 3 or Darwin Streaming Server 3 software. The server must also be configured properly for skip protection.

QuickTime users can view content normally when these conditions are not met, but without skip protection.

Requirements for Skip Protection

- QuickTime 5.0 or later (client)
  QuickTime Streaming Server 3.0 or later **or** Darwin Streaming Server 3.0 or later
- QuickTime 5 must be set to use UDP for streaming transport.
  Note: Skip Protection is only available via UDP. HTTP streaming transport does not accommodate this feature.
- QuickTime Streaming Server 3 must be set up by the server admin for media location. This is set in the server's XML preference file by the parameter reliable_udp_dirs.

Mac OS X 10.0: "<Attachment Missing>" Message When Sending Plain Text Mail

Recipients of your email see the text "<Attachment missing>" in the body of the mail message, but the attachment is actually present.
This article has been archived and is no longer updated by Apple.

Symptom

Recipients of your email see the text "<Attachment missing>" in the body of the mail message, but the attachment is actually present.

Solution

This issue is resolved by updating to Mac OS X 10.1.

For Mac OS X 10.0 to 10.0.4:

Despite this message, the attachment is still present and can still be opened.

The application Mail, included with Mac OS X, uses the Rich Text (HTML/MIME) message format by default. You can change the format of a message to plain text by choosing the Make Plain Text command from the Format menu in Mail. The best way to avoid the erroneous message is to use the Rich Text format when possible.

When you send a plain text mail that includes an attachment, some mail programs do not recognize the encoding of the message, leading them to display "<Attachment missing>" in the body of the message. This lack of recognition occurs because the message is being encoded in the Alternative MIME standard so it can be compatible with the widest range of recipients. This issue does not affect recipients who are using Mail to view mail.

Mac OS X 10.0: Reselecting Startup Disk May Be Necessary Following Update

Reselect your startup disk after installing a Mac OS X software update to avoid a startup delay.
This article has been archived and is no longer updated by Apple.

Symptom

After installing a software update to Mac OS X 10.0, there is a longer delay before the Mac OS logo appears at system startup time.

Solution

Follow these steps:

1. Start up the computer from the Mac OS 9.1 CD-ROM disc.
2. Open the Startup Disk control panel.
3. Select the Mac OS 9.1 System Folder on the hard disk.
4. Restart the computer.
5. Connect to the Internet.
6. Open the Software Update control panel.
7. Click Update Now.
8. If the Software Update control panel offers you a later version of Startup Disk control panel, install it and then restart the computer.
9. Open the Startup Disk control panel.
10. Select the Mac OS X System Folder.
11. Restart the computer.

The computer should startup normally using Mac OS X.
Published Date: Feb 17, 2012

Mac OS X: PC-DOS Formatted Disks Do Not Work With Classic Applications

You cannot save directly to a PC-DOS formatted disk from an application that is open in the Classic environment. Unexpected behavior can also occur when you use the Mac OS X Finder to directly open (double click) a Classic file stored on a PC-DOS disk.
This article has been archived and is no longer updated by Apple.

Symptom

1. Dialog boxes in Classic applications do not offer you the option of saving to a disk that is in the PC-DOS format.

2. If, in the Mac OS X Finder, you double click (or otherwise open) a Classic application file stored on a PC-DOS disk, one of these symptoms could occur:

- The Classic application of the type that created the file may open with no windows.
- A new document window may open in the affected Classic application.
- The affected Classic application may generate an alert box with a message stating that the file is already in use

Solution

Saving Files

The Classic Environment in Mac OS X 10.2 or later can work directly with volumes formatted using the DOS File Allocation Table (FAT) format.

If you need to save to a PC-DOS formatted disk from a Classic application in an affected Mac OS X version, use these steps:

1. Save the file to a location on your hard disk, such as your Documents folder or desktop.
2. After the file has been saved, select the Finder from the Dock.
3. Using the Finder, navigate to the location in which you saved the file.
4. Drag the file from the Finder window to the disk icon.
Note: This requires two Finder windows if you have deselected the option to have disks displayed on the desktop.

If you do not need to exchange files with a computer that uses PC-DOS formatted disks, then you may wish to reformat the disks as either Mac OS Standard or Mac OS Extended format. You will be able to save to disks with either of these two formats from within Classic. Mac OS Extended is preferred if all the Macintosh computers that use the disk have Mac OS 8.1 or later.

Opening Files

If you need to open a Classic document from a PC-DOS disk, simply copy the file to the Documents folder on your hard disk and open it from there.

Mac OS X Server 10.0: Advertised MySQL Not Included on CD-ROM, May Be Downloaded

The advertised MySQL feature is not included in the first version of Mac OS X Server (10.0.3) but is available for download.
This article has been archived and is no longer updated by Apple.

Symptom

MySQL is not installed by Mac OS X Server 10.0.

Solution

MySQL was omitted from the initial version (10.0.3). The 10.0.4 Server Update includes MySQL. Before installing the 10.0.4 Server Update, your server computer must be updated to Mac OS X 10.0.4. You may download these updates by visiting Apple Software Downloads (http://www.apple.com/swupdates/).

Published Date: Feb 17, 2012

Mac OS X 10.0: Mac OS 9.1 Language Kits Work in Classic

The Language Kits included as an optional installation for Mac OS 9.1 can be used in the Classic environment of Mac OS X.
This article has been archived and is no longer updated by Apple.
The optionally-installed Language Kits included with Mac OS 9.1 can be used with Classic applications just as in native Mac OS 9.1.

If you plan to use Language Kits in the Classic environment, be sure to install software updates specific to your language kit.

Important: The Language Kit software updates are not available at Apple Software Updates (http://www.apple.com/swupdates/) or in the Knowledge Base (http://kbase.info.apple.com/). They only appear in the Mac OS 9.1 Software Update control panel after a particular Language Kit is installed.

Follow these steps to download a Language Kit update:

1. If you have installed a Mac OS 9.1 Language Kit, restart your computer from Mac OS 9.1.
2. If your computer is started up from Mac OS X, choose System Preferences from the Apple Menu. Click the Startup Disk icon and then select the Mac OS 9.1 System Folder. Close the System Preferences window and choose Restart from the Apple menu. The computer will restart using Mac OS 9.1.
3. Connect to the Internet.
4. Choose Control Panels from the Apple Menu.
5. Open the Software Update control panel.
6. Click Update Now.
7. Install any Language Kit updates that appear. If you do not see any updates, the Language Kit you have installed does not require one.
8. Open the Startup Disk control panel and choose the Mac OS X System Folder to restart the computer using Mac OS X.

Macintosh Manager 2.0: About Macintosh Manager

This document contains a copy of the "About Macintosh Manager" document for version 2.0.
This article has been archived and is no longer updated by Apple.

About Macintosh Manager

This document includes information about additional Mac OS client software for use with the Mac OS X Server. The Macintosh Manager installation will install Macintosh Manager 2.0, a version of AppleShare Client, and Macintosh Manager 2.0 administration software.

Macintosh Manager is Apple's workstation management technology, providing education network administrators with a centralized method of securing Mac OS workstations, controlling student software access, and providing a consistent, personalized experience for students and staff.

AppleShare Client allows client computers to connect to the server. A version of AppleShare Client is installed by default when you install Macintosh Manager 2.0. If you are installing on a 68K-based computer, AppleShare Client 3.8.7 will be installed. If installing on a PowerPC-based computer, AppleShare Client 3.8.8 will be installed.

To administer Macintosh Manager on a server running Mac OS X Server software from a remote Mac OS 9 computer, install the Macintosh Manager administration software using the Custom Install option of the Mac OS Client Installer.

Macintosh Manager 2.0 administration can be used to manage client computers with Mac OS 8.1 or later.

For more information about these software applications, refer to the Admin Guide.pdf file on the CD, the online Help for Macintosh Manager and Server Admin, and late-breaking news which is available in the online Help.

System requirements

Macintosh Manager 2.0 client software requires a computer with:

- Mac OS 8.x or 9.x

AppleShare Client software:

- AppleShare Client 3.8.7 requires a computer running Mac OS 8.1 to 8.5
- AppleShare Client 3.8.8 requires a computer running Mac OS 8.1 or later

Macintosh Manager 2.0 administration software requires a computer with:

- Mac OS 9 or Mac OS X
- At least 64 MB of RAM

Published Date: Feb 17, 2012

Mac OS X: How to Disable or Enable Automatic Modem (PPP) Connections

Use these steps to enable or disable your computer's ability to automatically connect to the Internet.
This article has been archived and is no longer updated by Apple.

To turn on or turn off automatic dial-up (PPP) Internet connections

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. Choose your modem or other dial-up device from the Show pop-up menu.
Note: The Show menu is named "Configure" prior to Mac OS X 10.1.
4. Click the PPP tab.
5. Click PPP Options.
6. Click the checkbox to select or deselect the "Connect automatically when starting TCP/IP applications" option.
7. Click OK.
8. Click Save.

With automatic connection disabled, Mac OS X will prompt you to connect to the Internet when necessary. You then connect using the Internet Connect application.

Additional information

Mac OS X connects to the Internet automatically in some circumstances. For example, Mac OS X attempts to connect to the Internet to:

- download Help Center information, including Late Breaking News
- search for and retrieve software updates from Apple (via scheduled automatic software updates)
- perform a Sherlock Internet search
- send or receive email using the Mail application
- to start Web Sharing as your computer starts up (Mac OS X 10.2.8 or earlier)

When automatic connection is enabled and you are not yet connected to the Internet you may see a message such as "The specified server could not be found" or "A connection failure has occurred" when you open a Web browser This only means that the browser attempted to connect before the computer had completed the connection process. This does not indicate any issue with your configuration or Internet service provider. If necessary, quit and reopen the browser after the connection sequence is complete. If such messages persist after you are connected, you may need to check your DNS settings. See technical document 106798, "**Mac OS: Troubleshooting 'A connection failure has occurred', 'The specified server could not be found' or Similar Messages**".

If the setting to "Connect automatically when starting TCP/IP applications" is enabled in the Network pane, you may not be aware that the connection has been made. In Mac OS X versions prior to 10.1, enabling modem sound does not permit you to monitor when your modem is connecting. Updating to Mac OS X 10.1 or later resolves that issue. See technical document 106162: "**Mac OS X 10.0: Internal Modem Makes No Sound When Connecting**"

If you are obviously already connected to the Internet but an alert box appears with a message that says "...is not able to connect to the Internet" see technical document 106291: "**Mac OS X 10.0: Software Update, Mac Help, or Sherlock 'is not able to connect to the Internet' Message**"
Published Date: Feb 17, 2012

Mac OS X Server 10.0: Computer Stops Responding at "Starting Network Filesystem"

The computer does not finish starting up if it has been improperly set up to have an NFS loopback. It stops when the progress bar reaches "Starting Network Filesystem."
This article has been archived and is no longer updated by Apple.

Symptom

During system startup time, the Mac OS X Server computer appears to stop responding ("hangs" or "freezes") when the progress bar reaches the message:

> Starting Network Filesystem

The most common cause for this symptom is that the server has been configured to automatically connect to an NFS export that is on the server's own hard disk, a condition called a "loopback."

Solution

There are two ways to resolve an NFS loopback:

- Restore your network.nidb file from a good backup, **or**
- Delete or modify the mount(s) causing the issue.

Since the server will not start up normally, you can start up into single-user mode and use the "nicl" command tool.

Follow these steps to delete the mount(s) causing the issue:

1. When you turn on the computer, press and hold the Command and "s" keys to enter single-user mode.
2. Type: `mount -uw /`
3. Press Return.
4. Type: `fsck -fy`
5. Press Return, and wait for fsck to complete a file system check.
6. Type: `nicl -raw -v /var/db/netinfo/network.nidb`
7. Press Return.
8. Type: `cd /mounts`
9. Press Return.
10. Type: `ls`
11. Press Return. This should list the mounts.
12. Type: `read`
13. Press Return. You should see a list of the directory's contents with expanded information. Write down the name of any item that has: vfstype = nfs.
14. Type: `cd name`
Note: In place of "name," you would type the name of one of the names you wrote down in step 13.
15. Press Return.
16. Type: `delete`
Note: If you check the file path, you should **not** be in /mounts/, but rather in an appropriate subdirectory of mounts, such as /mounts/directoryname/.
17. Press Return.
18. Repeat steps 14-17 for any additional name(s) that you wrote down in step 13.
19. Type: `quit`
20. Press Return to exit nicl.
21. Type `reboot`
22. Press Return to restart the server.

Mac OS X 10.0: How to Remove a Picture from Address Book

A picture added to an Address Book entry appears in Mail when viewing a message from that person, even after the entry is deleted. Use these steps when you wish to remove a picture.
This article has been archived and is no longer updated by Apple.

Symptom

After deleting a person's entry in Address Book, the picture associated with that entry continues to appear in Mail.

Solution

First, locate the picture you wish to remove.

Address Book stores pictures in the folder:

~/Library/Images/People/

Note: The tilde character (~) represents your Home directory. Click the Home icon in the Finder toolbar, then proceed to your Library folder and so on.

After you navigate to the People folder, you see files with names that correspond to the email addresses in your Address book. The files carry the filename suffix ".tiff." An example could look like:

e_dupont@apple.com.tiff

To remove the picture from Mail, simply drag it to the Trash.

Mac OS X Server 10.0: How to View NFS Exports

Use steps described here to view current NFS exports in Mac OS X Server 10.0.x.
This article has been archived and is no longer updated by Apple.

Finding a list of current NFS exports

To see if an individual folder or disk has been exported, use these steps:

1. Open the Server Admin application.
2. Click the General tab.
3. Click the Sharing icon, then select Set Sharing Attributes.
4. In the Choose Object window, select the item and click Choose.
5. Set the pop-up menu in the item's privileges window to NFS Access Control.

Here, you can see the NFS Export status of the disk or folder.

Listing all current exports

To list all the current exports, use the Terminal application located in the folder Applications/Utilities/.

The list of exports is maintained by the mountd daemon. The Server Admin application manages this data, which is used by the mountd daemon to perform the export. To list all folders that have been exported, follow these steps:

1. Open the Terminal application.
2. Type: `showmount -e`
3. Press Return.

To list the raw data that determines which folders are exported and the export options, follow these steps:

1. Open the Terminal application.
2. Type: `nidump -r /exports .`
   Note: Be sure to add the space and period at the end of the command. This determines the database to which the nidump command is applied. The period indicates the local NetInfo database.
3. Press Return.

Mac OS X Server 10.0: How to Set SLP Neighborhood

Setting your SLP Neighborhood determines where your server appears on the network.
This article has been archived and is no longer updated by Apple.

Defining where your computer appears

In Mac OS 9.x and Mac OS X (client), a computer's services are registered by default in the Local Network neighborhood. You can see this in the Connect to Server window (Mac OS X) and Network Browser (Mac OS 9.x). A large network may be logically divided into smaller neighborhoods, which are also called "scopes." Examples of such division might include groupings by department or by floors of a building.

To change a Mac OS X computer's default neighborhood, follow these steps:

1. Open the Set SLP Neighborhood application, found in the /Applications/Utilities/ folder. The SLP Neighborhood window shows where your computer is set to register its services.
Note: This application may not be present on versions of Mac OS X released prior to Mac OS X Server 10.0.3.
2. Type the name of the new SLP neighborhood.
Important: If your network has one or more SLP servers, you must enter a neighborhood (scope) that is already defined on one of these servers. Otherwise, your service will not be visible to the rest of the network.
3. Click Save.
4. Choose Restart from the Apple menu.

Your computer should now appear in the new neighborhood when viewed in the Connect to Server window or Network Browser.
Published Date: Feb 17, 2012

Mac OS X Server 10.0: AppleShare Does Not Start When Duplicate Computer Names Exist

Apple File Service (AFP, AppleShare) does not start and does not display an alert to warn you when another computer on the network is already sharing under the same Computer Name.
This article has been archived and is no longer updated by Apple.

Symptom

1. Clients cannot connect to the server as expected.
2. Clients connect to a computer that is not the desired server.
3. The Apple File Service log, accessible with the Log Viewer feature of Server Admin, contains the message:

"AppleTalk service couldn't be enabled."

Solution

Each computer sharing files with AppleShare must have a unique Computer Name. The Computer Name field for Mac OS X Server is located in the Server Admin application. For Mac OS 9 and Mac OS X (client), the Computer Name field is located in the Sharing panel.

The exact order of operations required to address this situation in the least number of steps can vary depending on which computer you wish to rename, but these steps cover all situations:

1. Identify all computers that share the same Computer Name.
2. Stop AppleShare (AFP, File Sharing, Apple File Services) on all computers you have identified.
3. Give each computer a unique Computer Name.
4. Restart AppleShare (AFP, File Sharing, Apple File Services) on all computers.

Mac OS X Server 10.0: Print Center Requires BSD Package for LPR

You cannot use LPR printers in Print Center if you did not install the BSD package.
This article has been archived and is no longer updated by Apple.

Symptom

LPR is not available to Print Center, and therefore not available to Print Service.

Solution

By default, the installer for Mac OS X Server 10.0.x installs the BSD package. Using the Custom Install option, you may deselect this package.

The BSD package includes software required for LPR printing. Without BSD, you may still use AppleTalk and USB printers.
Published Date: Feb 17, 2012

Mac OS X Server 10.0: Deleting Guest-Created Folders Requires root Access

A folder created by an AppleShare user logged in through Guest access can only be deleted by the root user.
This article has been archived and is no longer updated by Apple.

Symptom

When you are logged in as an Admin user and attempt to delete a folder that was created by an AppleShare user logged in with Guest access, an alert appears with this message (or a variation of it):

> "The operation cannot be completed because you do not have sufficient privileges for '502'."

Solution

Folders created in this manner have an owner of "Unprivileged User" or "Nobody." You must use root access to delete a folder (directory) created by a Guest-access user.

Deleting with Terminal

If you are familiar with the Terminal, you may use the sudo command to delete the undesired folder.

Deleting with Finder

Otherwise, follow these steps:

1. Choose Log Out from the Apple menu.
2. Log back in as the root user.
Note: The root user does not appear in the Users pane of System Preferences but is enabled in Mac OS X Server 10.0.3 by default.
Where you would normally type your user name during login, type: `root`
3. Type your normal Admin user password.

Once logged in as root, you can delete the folder by Choosing Empty Trash from the Finder menu.
Published Date: Feb 17, 2012

Mac OS X 10.0: Removable disks don‘t appear (mount) on desktop

In some cases with Mac OS X 10.0 through 10.0.4, removable media (CD-ROM discs, Zip disks, for example) may not appear on the Mac OS X desktop as expected.
This article has been archived and is no longer updated by Apple.
When the disk is inserted, an alert appears with this message:

> "You have inserted a disk containing volumes that Mac OS X can't read. To use the unreadable volumes, click Initialize. To use only the rest of the disk, click Continue."

This issue may occur when certain information is missing from the file /etc/hostconfig.

First, be sure that you have selected the checkbox to Show disks on the Desktop in Finder Preferences:

1. Click Finder in the Dock.
2. Choose Preferences from the Finder application menu.

To determine if information is missing from the file /etc/hostconfig, check the contents of this file using TextEdit.

Checking the hostconfig file

Follow these steps:

1. Open TextEdit (located in the Applications folder).
2. Choose Open from the File menu.
3. In the "Go to" field of the Open dialog, type: `/etc/hostconfig`
4. Click Open.

The hostconfig file should contain the following line:

> AUTODISKMOUNT=-REMOVABLE-

The final section of this article contains a sample hostconfig file that is correctly set up. If this line is not present, removable media will not appear on the desktop. You can update the hostconfig file by following these steps.

Updating the hostconfig file

1. Create a new document in TextEdit.
2. Copy and Paste in the text that is in the section below, titled "Sample hostconfig file."
3. Choose Make Plain Text command from the Format menu.
Note: If this command is not present in the Format menu, skip this step (as you have already set plain text as the default format).
4. Save this file to the Documents folder with the name: `hostconfig`
Note: The resulting file will actually be called: hostconfig.txt
5. Open the Terminal application (located in the Utilities folder).
6. Type: `sudo mv /etc/hostconfig /etc/hostconfig.old`
7. Press Return.
8. Type the Admin user password, and press Return.
Note: The command will rename the existing hostconfig file to hostconfig.old.
9. Type: `sudo cp ~/Documents/hostconfig.txt /etc/hostconfig`
Note: This command copies the new hostconfig file to the correct location.
10. Press Return.
11. Restart the computer.

Sample hostconfig file

Begin copying below this line:

```
##
# /etc/hostconfig
##
# This file is maintained by the system control panels
##
# Network configuration
HOSTNAME=-AUTOMATIC-
ROUTER=-AUTOMATIC-
# Services
AFPSERVER=-NO-
APPLETALK=-NO-
AUTHSERVER=-NO-
AUTOCONFIG=-YES-
AUTODISKMOUNT=-REMOVABLE-
AUTOMOUNT=-YES-
CONFIGSERVER=-NO-
IPFORWARDING=-NO-
MAILSERVER=-NO-
MANAGEMENTSERVER=-NO-
NETBOOTSERVER=-NO-
NISDOMAIN=-NO-
TIMESYNC=-NO-
QTSSERVER=-NO-
SSHSERVER=-NO-
WEBSERVER=-NO-
```

End copying above this line.

Mac OS X Server 10.0: Server Admin System Requirements and Installation

You can administer Mac OS X Server from another computer that meets the requirements of Server Admin.
This article has been archived and is no longer updated by Apple.
You can administer Mac OS X Server from another networked computer that meets the system requirements of Server Admin. The computer must have a valid IP address and a TCP/IP route to the server. Firewalls and router configuration may prevent you from administering Mac OS X Server from some locations on the Internet, or on your network. If you suspect this is an issue, check with your Internet service provider or network administrator.

System Requirements for Server Admin

- Mac OS X 10.0.2

The remote admin computer must have Mac OS X 10.0.2 or later. If you have Mac OS X 10.0.2, you should update to Mac OS X 10.0.3 or later at your next opportunity. You may find software updates at http://www.apple.com/swupdates/ .

For complete Mac OS X 10.0.x system requirements, please see:

Article 106163: "**Mac OS X 10.0: System Requirements**"

How to install the Server Admin application

To install the Server Admin application on a remote computer, follow these steps:

1. Verify that the remote computer has a valid TCP/IP connection. You may also verify a route to the server by using the Network Utility included with Mac OS X.
2. Insert the Mac OS X Server CD-ROM disc.
3. Open the Admin Install folder and double-click the installer package (Admin_Install.mpkg).
4. Choose the Custom Install option, then select Server Admin.

After installation, you'll find the application in this location:

/Applications/Utilities

You may drag the Server Admin icon to the Dock for easy access.
Published Date: Feb 17, 2012

Mac OS X 10.0: Mail Import From Outlook Express Requires "Microsoft User Data" Folder

If the Identities folder for Microsoft Outlook Express is not located within the Microsoft User Data folder, the import utility cannot automatically import your email.
This article has been archived and is no longer updated by Apple.

Symptom

The application Mail, included with Mac OS X, cannot locate email to import from Outlook Express.

Note: Versions of Outlook Express prior to 5 do not use the Microsoft User Data and Identities folder hierarchy. You may, for example, update from Outlook Express 4.5 to Outlook Express 5 to create a Microsoft User Data folder before importing email with Mail.

Solution

You may use **one** of the following solutions:

1. Create a new folder named "Microsoft User Data," and place the Identities folder inside this folder.

2. Click the Browse button on the second screen of the "Import mailboxes" utility to select the Identities folder containing the email you want to import.

Macintosh Manager 2.0: Global CD-ROMs Eject Button Does Not Work With CarbonLib 1.2.5

The Eject button in the Global: CD-ROMs pane of Macintosh Manager does not work with CarbonLib 1.2.5.
This article has been archived and is no longer updated by Apple.

Symptom

After opening Macintosh Manager and clicking the Global tab followed by the CD-ROMs tab, the Eject button does not work as expected.

Solution

Restart the computer and drag the CD icon to the Trash to eject it.

To avoid this in the future, be sure that CarbonLib 1.2.5 is not installed on the affected computer. You can download an earlier or later version from Apple Software Updates (http://www.apple.com/swupdates/).

How to check for CarbonLib

1. Choose Control Panels from the Apple menu.
2. Open Extensions Manager.
3. Scroll down in the Extensions Manager window until you find CarbonLib.

The version number of CarbonLib is displayed to the right of its name.
Published Date: Feb 17, 2012

Mac OS: Computers in Sleep Mode Disappear From Network

When the name of a computer in sleep mode disappears from the network, you may still connect to it by IP address.
This article has been archived and is no longer updated by Apple.

Symptom

The name of a computer in sleep mode no longer appears in the Connect to Server dialog, Chooser, or Network Browser.

Products Affected

- Mac OS X 10.0 or later
- Mac OS X Server 10.0.3 or later
- Mac OS 9.x

Solution

A computer's name does not appear on the network after it has been in sleep for three hours. To connect to a computer in sleep mode, type its IP address or DNS name (when applicable). The Chooser, Connect to Server dialog, and Network Browser each provide a field for this purpose.

Note: AppleTalk must be active for a computer to appear in the Chooser.

Mac OS X 10.0: 10.0.4 Update and Before You Install Information

The Mac OS X 10.0.4 Update addresses certain issues and updates system software.

This article has been archived and is no longer updated by Apple.

There are two versions of the update available to bring your computer to Mac OS X 10.0.4. Use of this update does not require that you install prior updates.

10.0.4 Update (19.3 MB)

This updates any previous version (10.0, 10.0.1, 10.0.2, and 10.0.3) to Mac OS X 10.0.4.

10.0.4 Update (12 MB)
This smaller update updates Mac OS X 10.0.3 to Mac OS X 10.0.4.

There are two ways to get the Mac OS X 10.0.4 Update:

1. Open System Preferences and use the Software Update feature. When you click Update Now, the Software Update pane automatically displays the correct version of the 10.0.4 Update for your computer.

2. Download the appropriate installer from Apple Software Updates.

Related Software Downloads

75141 Mac OS X (10.0.4) Combined Update Information and Software
For Mac OS X (10.0.0 - 10.0.3)

75142 Mac OS X (10.0.4) Update Information and Software
For Mac OS X (10.0.3)

Important: Read Before Installing

1. You must have an Admin user password to install this update. The password must not contain spaces and may not be blank. Certain characters may also produce unexpected results when used in a password. Generally, these characters are those you type using the Option key. To change your password, open System Preferences and click Users. Select an Admin user and click Edit User. Create a new password. For best security, put both numbers and letters within the first eight characters of the password.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means such as the Terminal. This precautionary statement does not apply to the normal installation of application software.

3. The 10.0.4 Update installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. When viewing Detailed Progress, it is normal for the window to state "optimizing" for several minutes. If you experience a power outage or other interruption during installation, download the 10.0.4 Update standalone installer from Apple Software Updates and use it to install the update.

Steps to install the update using Automatic Software Update

(You must first be connected to the Internet.)

1. Quit open applications, which are marked in the Dock with a small triangle. You cannot quit the Finder.
2. Choose System Preferences from the Apple menu.
3. Click Software Update.
4. Click Update Now.

Note: You must install Software Update 1.3.1 in order to access other updates using the Software Update feature of System Preferences. After installing Software Update 1.3.1, repeat the above steps to install the 10.0.4 Update.

About the 10.0.4 Update

This update delivers enhancements included with the 10.0.1 and 10.0.3 Updates, as well as the following:

USB-Related Enhancements

- PrintCenter compatibility with certain third-party USB inkjet printers has been improved.
- Improves compatibility with many third-party USB devices including: "KVM" switchboxes, certain self-powered USB hubs, certain handheld devices that connect to a USB port, certain ADB-to-USB adapter devices, and third-party USB mouse and keyboard input devices.
- Improves iTunes audio CD burning performance by offering only the most reliable burn speed choice(s).
- Resolves a rare issue in which a USB device may not respond after the computer wakes from sleep.
- Enriches the reliability of USB input devices that connect to a display's USB port.
- USB modem reliability is improved.
- Addresses issues that may have led to a USB mouse or keyboard input device becoming unresponsive unless it was disconnected and reconnected.
- Resolves an isolated issue in which a Roland/Edirol UA-3 audio device may have not properly enumerated on the USB bus.
- Addresses a potential kernel panic that may have occurred when disconnecting or hot swapping certain third-party USB devices.
- Brings iTunes compatibility to additional third-party USB CD-RW drives, including: Toshiba DVD-ROM SD-R1102 Combo Drive, Que Plextor PX-W1610A, MKE CD-RW CW8571B, Que Lite-On LTR-12101B, Iomega ZipCD 650, and Iomega Predator ZipCD 650.
- Resolves an issue in which simultaneous use of two Shift keys while typing with a USB keyboard may have unexpectedly resulted in lowercase characters.

Classic-Related Enhancements

- Enhances reliability when remotely accessing a shared FileMaker Pro 5.0 document through TCP/IP in the Classic environment.
- Addresses a rare issue in which no response was received when pinging a remote host in the Classic environment.
- Enhances the reliability of the Classic environment after the computer wakes from sleep.
- Addresses an isolated issue in which a key press may have repeated unexpectedly in a Classic application.
- Addresses a potential issue in the Classic environment in which the mouse pointer cursor may have become temporarily transparent.
- Enriches reliability of certain Classic mail applications when used with certain types of mail servers.
- Addresses a potential issue in the Classic environment with products that provide firewall services.
- General improvements allow third-party hardware device drivers to perform better in the Classic environment; future OS X hardware device drivers can be developed to co-exist with Classic device drivers for the same USB device.

Internet- and Networking-Related Enhancements

- Addresses certain issues that may have occurred when copying files using Apple File Protocol (AFP), including: potential kernel panic when copying files, reliability on a VPN connection, and copying a file that has a long Japanese file name.
- The advanced PPPoE option "Send PPP echo packets" now behaves as expected when disabled.
- Addresses a potential issue where Internet Explorer 5.1 may have become temporarily unresponsive when viewing a QuickTime movie.
- A later version of SSH is included.

Other Enhancements

- Improves reliability when a large number of FireWire devices are disconnected and reconnected.
- Enhances reliability when viewing certain types of PICT files.
- Addresses a potential issue in which a copied file's modification date may be inaccurate.
- Resolves an issue in which the restart button does not appear after the installation of software that requires a restart.
- A Brightness slider bar is now available when used with the Apple Studio Display 17.
- Improves reliability for applications that interact with SCSI devices and SCSI busses.
- Optical media is made available more reliably from certain third-party FireWire and USB devices.
- Enriches the reliability of some display resolution choices provided by certain ATI video cards.
- Resolves a headphone volume and potential sound quality issue involving Power Macintosh G3 computers that use certain A/V personality cards.
- Addresses a potential issue with certain PowerBook computers in which an undesirable sound may be heard while the computer is in sleep mode.
- Enhances PowerBook battery power conservation when in sleep mode.
- Improves responsiveness of application menus that are drawn with OpenGL.
- Addresses a potential issue in which the startup hard disk volume could not be renamed after updating the version of Mac OS X.
- Resolves an isolated issue when using paint frames in an AppleWorks 6.1 presentation document.
- Addresses a rare issue in which an incomplete login window or graphics abnormality appears after waking from a period of sleep that began

while a screen saver had been in use.
- Resolves a potential issue when printing from applications localized for German.
- A later version of sudo is included.

Published Date: Feb 20, 2012

Mac OS X : Password Does Not Work As Expected After a Change

When using Mac OS X Server, the Setup Assistant creates both Admin and root user accounts with the same password. For Mac OS X (client), the root password remains undefined until you enable the root user. In both versions of Mac OS X, subsequent changes to a password only affect the selected user, not both.
This article has been archived and is no longer updated by Apple.

Symptom

After changing your password, the previous password continues to work for certain functions.

Solution

During the installation process, the Mac OS X or Mac OS X Server Setup Assistant asks for an Administrator account name and password. The Setup Assistant then creates both a "root" user and an "Admin" user. For Mac OS X Server, the Admin and root accounts created both have the same password and root is enabled by default. For Mac OS X (client), the root password remains undefined until you enable root, which is disabled by default. Only the Admin user is immediately visible to you in either version of Mac OS X.

When you change the password at a later time, only the password of the selected user is changed. The password of the other user remains in effect until you change it.

The two users have different capabilities, login names, and visibility characteristics.

	Admin User	root User
Description	The "Admin" user is created for day-to-day login and operation of your computer. The Admin user can log in to the Server Admin and Macintosh Manager applications, but the root user cannot. You can create multiple Admin users in the Users pane of System Preferences.	The "root" user can perform certain administrative tasks that are restricted from the Admin user, such as installing WebObjects software or setting up the NetInfo database. The root user is enabled by default in Mac OS X Server but not in Mac OS X (client). You can have only one root user.
Login Name	The Admin user takes the name you set in the Setup Assistant, which may be changed in the Users control panel.	Type the name "root" or "System Administrator" to log in as the root user.
Visibility	The Admin user name appears in the Users pane of System Preferences regardless of who is logged in to the computer. Admin users have Home directories that appear in the Finder.	The root user only appears in the Users pane of System Preferences (as "System Administrator") when you are logged in to the computer as root. The root Home directory (/Private/var/root/) only appears in the Finder when logged in to the computer as root.
Password Change	Follow these steps: 1. Choose System Preferences from the Apple menu. 2. Click Users. 3. If necessary, click the padlock to make changes. 4. Select the user designated Admin. 5. Click Edit User. 6. Type a new password in the Password and Verify fields. 7. Click OK.	Follow these steps: 1. Choose Log Out from the Apple menu. 2. Log in as the root user. 3. Choose System Preferences from the Apple menu. 4. Click Users. 5. Select the user named System Administrator. 6. Click Edit User. 7. Type a new password in the Password and Verify fields. 8. Click OK.

Important

1. Do not confuse "Admin" with "System Administrator," which is actually an alternative name for the root user (see table above).

2. For more information on the root user, including precautionary statements, please see:

Article 106290: "**Mac OS X: About the root User and How to Enable It**"
Published Date: Feb 17, 2012

Mac OS X 10.0, 10.1: Setup Assistant Creates Two Administrative Users - Admin and root

When using Mac OS X Server, the Setup Assistant creates both Admin and root user accounts with the same password. For Mac OS X (client), the root password remains undefined until you enable the root user. In both versions of Mac OS X, subsequent changes to a password only affect the selected user, not both.

This article has been archived and is no longer updated by Apple.

Symptom

1. After changing your password, the previous password continues to work for certain functions.
2. It may seem that your password does not work for certain functions.

Solution

Mac OS X uses Admin and root users for different types of administrative functions.

For a discussion of this issue, see:

Article 106361: "**Mac OS X 10.0, 10.1: Password Does Not Work as Expected After a Change**"
Published Date: Feb 17, 2012

Mac OS X Server 10.0: Directory Services - Password Security Issue With Windows 2000 Active Directory Group Name

When using a Windows 2000 server for authentication, an Active Directory Group name is accepted for authentication with any nonblank password.
This article has been archived and is no longer updated by Apple.

Symptom

When using a Windows 2000 server for authentication, an Active Directory Group name is accepted for authentication with any nonblank password.

Solution

Normally, this should only grant guest access. But an issue exists in Windows 2000 that results in authentication. Check with Microsoft for updates to Windows 2000 that may resolve this issue.

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X Server 10.0: Troubleshooting Long Delay at System Startup Time or Server Admin Login

After initial setup, Mac OS X Server 10.0 may take a longer time than expected to start up or connect with the Server Admin application.
This article has been archived and is no longer updated by Apple.

Symptom

The server takes longer than expected to start up. Establishing a connection between Server Admin and the server takes longer than expected.

Solution

By default, Mac OS X Server 10.0 verifies connections with numerical TCP/IP addresses (such as 17.254.0.91) by performing a reverse lookup of the corresponding DNS name (such as apple.com) through the user-defined Domain Name System server. If there is no DNS entry for the Mac OS X Server IP address, the server may continue to attempt lookup for the duration of an industry-standard "timeout" period before it connects with only the numerical address.

When logging in to Server Admin, you would experience this as a delay between the time you click Connect and the moment when the administrative interface appears on the screen. During this interval, the message "contacting the server" appears.

If there is an incorrect DNS entry available for the server's TCP/IP address, the Server Admin Agent may quit entirely.

Note: Server Admin Agent is a process at the server that listens for Server Admin connections, whether they originate from the server itself or from another computer. If you see an alert with a message that Server Admin Agent is not available, you may log out and log back in at the server, or restart the server as necessary to eliminate the message.

There are three options for resolving a DNS issue or working around it:

Create or correct a DNS entry

If the agent fails to connect, the best option is to make an entry at the DNS server that matches the assigned IP address and selected hostname of the Mac OS X Server. Until such a correction is made, a hostname can be assigned that matches an existing DNS entry. If you do not administer your own DNS server, contact your Internet service provider or network administrator.

Disabling DNS verification

To avoid connection delay or to eliminate an issue with an incorrect DNS entry, you may disable verification. You should do this when the correction or creation of a DNS server entry is not an option. Verification provides a greater degree of security.

Follow these steps to disable verification:

1. Open Server Admin.
2. Choose Preferences from the Server Admin application menu.
3. Set the pop-up menu in the Server Admin Preferences window to General.
4. Click the checkbox to deselect "Attempt to resolve IP addresses to DNS names."

Use "localhost" as logon address

When using Server Admin at the server itself, you may type "localhost" in the Address field of the Server Admin Logon window.

Mac OS X Server 10.0: Specify AFP Text Encoding for Older Mac OS Clients

You should specify the text encoding that is to be used by Mac OS 9 and earlier computers when they connect to Apple File Services.
This article has been archived and is no longer updated by Apple.
The Apple File Services component of Mac OS X Server 10.0.3 implements Apple Filing Protocol (AFP) version 3.0, which can use Unicode filenames. Unicode offers multiple language support within one character set.

To allow for backward compatibility with older AFP versions (which do not support Unicode filenames), the Server Admin application allows you to specify the character set (or "encoding") earlier clients are to use when connecting to the server. The default encoding specified for earlier AFP clients is the Roman character set. For example: If you have Mac OS 8.6 clients using Japanese characters to connect, you should set Apple File Service to use Japanese encoding for earlier clients.

Follow these steps to change the encoding:

1. Open Server Admin and log in.
2. Click the File & Print tab.
3. Click the Apple icon and select Configure Apple File Service from the submenu.
4. Click the Access tab.
5. Choose the correct character set for your clients from the Encoding for older clients pop-up menu.

Published Date: Feb 17, 2012

Mac OS X Server 10.0: Do Not Set a Home Directory to Mount Statically

A Home directory set to Automount does not appear as expected when a user logs in.
This article has been archived and is no longer updated by Apple.

Symptom

1. The Home directory does not automatically mount when a user logs in.
2. The user is logged into the server as Guest.

Solution

When you use the Automount option, you must choose between "Mount dynamically" and "Mount statically." Do not use static mounts for Home directories.

Note: The Automount setting is available in the privileges window for a sharepoint when using Server Admin.

Mac OS X Server 10.0: How to Install Over Other Versions of Mac OS X

This article discusses how to install Mac OS X Server 10.0.x over Mac OS X 10.0.x or Mac OS X Server 1.x.
This article has been archived and is no longer updated by Apple.
When installing Mac OS X Server 10.0 on a disk or disk partition that has Mac OS X 10.0.x or Mac OS X Server 1.x installed, you must check the option to format the destination disk or disk partition prior to installation.

Warning: Formatting your hard disk erases all data. You must make a backup of your disk prior to installation.

It is not necessary to reformat your disk if you are installing Mac OS X Server 10.0.x over Mac OS 9 and your hard disk is formatted as Mac OS Extended (HFS Plus).

Mac OS X Server: How to Locate MySQL; What Is It?

This article describes MySQL included with Mac OS X Server 10.0.3 or later.
This article has been archived and is no longer updated by Apple.
MySQL is a relational database management system, developed by MySQL AB (http://www.mysql.com/).

MySQL is installed in a hidden directory that is not visible in the Finder. You can find this directory by using the Terminal application to navigate to:

/usr/bin/

Note: Above is the correct location for 10.2.6 or later. For earlier versions, navigate to:

/usr/local/mysql

MySQL documentation is available online at: http://www.mysql.com/documentation/. Mac OS X Server 10.2 includes mysql version 3.

Mac OS X: Flashing Question Mark Appears; Computer Unexpectedly Starts up From Mac OS 9

Reselect the startup disk when you see a flashing question mark or when the computer unexpectedly starts up from Mac OS 9.

This article has been archived and is no longer updated by Apple.

Symptom

- After you turn on the computer, a flashing question mark appears on the screen.
- The computer may not start up or starts up from an alternate System Folder, such as the Mac OS 9 System Folder used by the Classic environment.

Solution

1. Start up the computer from the Mac OS 9 System Folder.
Note: If the computer does not start up successfully from Mac OS 9 a moment after the flashing question mark appears, then start up the computer using the Mac OS 9 CD-ROM disc included with Mac OS X 10.0, or the one that came with your computer. For best results, use Mac OS 9.2.1 or later.
2. Double-click the hard disk icon to open it.
3. Locate the System Folder in the hard disk and open it.
Note: There is another folder named "System". That is not the right folder.
4. Open the Control Panels folder.
5. Open the Startup Disk control panel.
6. Click the Mac OS X System Folder to select it.
7. Restart the computer.

Important

1. You should use Startup Disk 9.2.1, or later, which is available from Apple Software Updates (http://www.apple.com/swupdates/).

2. Startup Disk 9.2.1 is not included on a Mac OS 9.0 or 9.1 CD-ROM disc. The version of Startup Disk located in the System Folder on your hard disk is most likely a later version. For this reason, do not use the Startup Disk control panel available from the Apple Menu when started up from CD-ROM. Use the Startup Disk control panel located in the System Folder on the hard disk instead.

3. If you have installed licensed copies of Mac OS X on multiple disks on the same computer, see technical document 106220: "**Mac OS X 10.0: May Start Up From Wrong System Folder When Multiple Versions Are Installed**"

Screen Savers: Using With Liquid Crystal Displays

This article discusses the effect of prolonged use (burn-in), and screen savers in relation to liquid crystal display (LCD) panels.
This article has been archived and is no longer updated by Apple.

Burn-in

An image can be burned into an LCD panel if left displayed for an extended period (approximately 24 hours, depending on the image and LCD). However, unlike monitors with a cathode-ray tube (CRT), an LCD panel recovers over time and eventually dissipates the image.

To allow this recovery, the display panel must be turned off. The time it takes to recover depends on the original image and how long it was left on the screen. It generally takes between one and two times as long to remove the image as it took to burn it in.

Screen Savers

Although a screen saver can be used, it keeps the display backlight in use thereby decreasing its overall life. A screen saver may also prevent a PowerBook or iBook from going to sleep, decreasing battery life.

Putting the computer to sleep or shutting it down when it won't be used for extended periods is preferred to a screen saver. The Energy Saver control panel has a setting for display sleep that is applicable to both PowerBook and stand-alone flat panel displays such as the Apple Studio Display and Apple Cinema Display.

Mac OS X 10.0: "You have inserted a disk containing volumes that Mac OS X can‘t read" Alert

After inserting a Zip disk or a CD-ROM disc an alert box with this message may appear "You have inserted a disk containing volumes that Mac OS X can't read."

This article has been archived and is no longer updated by Apple.

For a discussion of this issue, please see Article 106345: "**Mac OS X 10.0: Removable Disks Do Not Appear (Mount) on Desktop**"

Published Date: Feb 17, 2012

Macintosh Manager, Mac OS: Alias Opens Wrong Item

An alias may open the wrong item when used with two or more volumes (disks or disk partitions) that have an identical volume creation date.

This article has been archived and is no longer updated by Apple.

Symptom

An alias opens a file, folder, or application other than the one that is expected.

Note: This article pertains only to an alias that is used on more than one volume, or on a volume other than the one from which it was created. This is most likely to affect a Macintosh Manager environment. However, this could occur when an alias is copied from one volume to another in an unmanaged environment.

Solution

Initialize the disk or disk partition. In a Macintosh Manager environment, this requires initializing all volumes to ensure that each volume has a unique creation date.

Background

This symptom occurs when two or more volumes have an identical creation date (down to minute and second), which effectively serves as a volume serial number for validating an alias. The duplication of creation dates allows an alias to be validated, even if the resulting destination is not correct.

QuickTime Streaming Server 2.0: Setting up a Web Page to Show Streamed Media

This article describes how to setup a web page to show streamed Media using QuickTime Streaming Server 2.0.
This article has been archived and is no longer updated by Apple.
QuickTime Streaming Server 2.0: Setting up a Web Page to Show Streamed Media

This article describes how to setup a webpage to show streamed Media using QuickTime Streaming Server 2.0.

Notes:
1. All information in this article comes from the help file distributed with QuickTime Streaming Server 2.0. The help file includes additional help topics which are not covered in the Knowledge Base.
2. This article discusses software for use only with Mac OS X Server version 1.2 (released prior to May 2001).

Setting Up a Webpage to Show Streamed Media

You can embed streamed media in a webpage. If you do this, viewers can use any web browser to view the media by entering the URL of the website.

> *For example:*
> `<pre>http://www.mywebpage.com/</pre>`

You would replace "www.mywebpage.com" with the DNS name of your website.

To embed live media in a webpage, you must create a reference movie that points to the SDP file in the folder you set up for streaming media. You store the reference movie on your website and include a link to the reference movie on your webpage.

For more information on creating reference movies, see the QuickTime Pro Reference Movie tutorial.

Mac OS X 10.0, 10.1: Pointer Disappears While Using Classic Application

Under certain circumstances, the pointer may temporarily disappear from Classic applications. The mouse remains responsive even though the pointer is not visible.
This article has been archived and is no longer updated by Apple.

Symptom

The pointer temporarily disappears while using a Classic application.

Solution

Update to Mac OS X 10.2 or later.

You can also try one of the following workarounds:

- Switch to a different open application by pressing the Command-Tab keyboard shortcut.
- Pull the mouse so that the pointer goes toward the bottom or side of the screen and the Dock responds. Open the System Preferences application. (You will know that the pointer is over the System Preferences icon when its name appears above the Dock). Click the Classic pane in System Preferences and restart the Classic environment.
- Restart the computer.

Published Date: Feb 17, 2012

Mac OS X Server 10.0: Form Data Not Sent to CGI When Using POST Method

If you use the Server Admin application to start Web service, any CGI script (Perl, PHP, Python, and so forth) will not receive data sent using the HTTP POST method from a Web page form.

This article has been archived and is no longer updated by Apple.

Symptom

Form data is not sent to a CGI when using the HTTP POST method.

To manually stop the Web server, simply replace the start command with stop.

Important: You may still use Server Admin to administer the Web server. If Server Admin module is used to start Web service or is set again to "Start Web service on system startup," this issue will recur.

Mac OS X 10.0, iMac: No Sound From External Speakers

Certain iMac computers using Mac OS X 10.0 may not produce any sound through external speakers plugged in to the computer's sound output port.

This article has been archived and is no longer updated by Apple.

Symptom

No sound comes from external speakers connected to an iMac.

Solution

Plug the external speakers in to one of the headphone jacks on the front of the computer instead of the sound output port on the side of the computer.

This issue may be avoided by updating to Mac OS X 10.1.

Published Date: Feb 20, 2012

Mac OS X: "No Driver for this platform" Message

This document explains what you should do if a kernel panic that includes the message "No driver for this platform" occurs.
This article has been archived and is no longer updated by Apple.

Symptom

A kernel panic occurs, and this message (or a similar one) appears:

> "No driver for this platform."

For an example of what a kernel panic looks like, see technical document 106227, "**Mac OS X: What is a Kernel Panic?**"

Solution

Is the computer Mac OS X-compatible?

Make sure your computer meets the system requirements for Mac OS X. For a list of compatible computers, see technical document 106163, "**Mac OS X 10.0, 10.1: System Requirements**".

Verify that you have a "System" folder

Mac OS X installs a folder named "System" which contains required software. Moving or renaming this folder can cause this symptom. If you have moved or renamed this folder, then start up the computer from Mac OS 9 and take corrective action. The folder must be located at the top (or "root") level of the Mac OS X disk and must be named "System".

If you do not have Mac OS 9 installed on the computer, you may start up from a Mac OS 9 CD-ROM disc. After inserting the CD, press and hold the "C" key immediately after restarting the computer to force the computer to start up from the CD.

For more information, see technical documents:

106805: "**Mac OS X: Do Not Move 'mach_kernel' or Other System-Installed Files and Folders, Some of Which Are Normally Invisible**"
106464: "**Mac OS X: Troubleshooting a Startup Issue**"

Notes:

1. The "System" folder should not be confused with the Mac OS 9 "System Folder". The default configuration for Macintosh computers is to have Mac OS 9 and Mac OS X installed on the same disk. You should see both of these folders at the top (or "root") level of your hard disk.

2. You also should not relocate other folders installed by Mac OS X at the root of your disk. These include Library, Users, and Applications. For more information on troubleshooting a kernel panic, see technical document 106464, "**Mac OS X: Troubleshooting a Startup Issue**".

Published Date: Feb 17, 2012

Mac OS X: 128-Bit 2D/3D Professional Graphics Card Causes Kernel Panic

Some Power Macintosh G3 models offered a build-to-order option for a 128-Bit 2D/3D Graphics Accelerator Card, which does not work with Mac OS X 10.0 to 10.2.8.
This article has been archived and is no longer updated by Apple.

Symptom

Either of these symptoms may occur:

- A kernel panic occurs during system startup time.
- A display connected to the 128-Bit 2D/3D Graphics Accelerator Card only works at a resolution of 640-by 480-pixels.

Any of the following computers when the build-to-order (BTO) 128-Bit 2D/3D Graphics Accelerator Card is installed:

- Power Macintosh G3 Mini Tower
- Power Macintosh G3 Desktop
- Power Macintosh G3 All-In-One
- Macintosh Server G3

Notes

1. This information does not apply to Power Macintosh G3 (Blue and White) computers.

2. For more information on the affected card, see technical document 22199: "**Power Macintosh G3: Information on Build-To-Order Configurations**"

Solution

You should not use the 128-Bit 2D/3D Professional Graphics Card in a computer with Mac OS X 10.0 to 10.2.8. The 128-Bit 2D/3D Professional Graphics Card does not meet the system requirements for Mac OS X versions 10.0 to 10.2.8.
Published Date: Feb 17, 2012

Mac OS X Server 10: Web service uses ports 80 and 16080 by default

The Apache Web server included with Mac OS X Server uses TCP port 16080 when the Performance Cache is enabled. Blocking this port can interfère with Web service.
This article has been archived and is no longer updated by Apple.

Symptom

Clients experience issues accessing Web service.

Solution

Do not block ports 80 or 16080 when setting up the IP Filtering feature of Mac OS X Server or any router or firewall.

Performance Cache communicates on port 80, which is normally used for Web service. Each port can accommodate only one service. Since the Performance Cache process is a front end http server by itself, Apache is reconfigured to run on port 16080. Performance Cache is enabled by default.

Interaction between Performance Cache and Apache

The Performance Cache stores data that can be reserved to clients who request it again. However, not all data can be cached. In this case, Performance Cache retrieves the data by querying Apache locally on port 16080. You may sometimes see clients sending requests to port 16080 directly, as the result of a redirect sent to the clients by Apache. Otherwise the Performance Cache process should transmit all request-response cycles.

Note: Because of this design, the Performance Cache process introduces a small performance penalty when serving dynamic content.

How to enable or disable Performance Cache

Click to select/deselect the checkbox for "Enable performance cache" in the Server Admin application. This setting is located in the General pane of the Web Service module of Server Admin.

In Server Settings, click the Sites tab in the Configure Web Service window. Double-click the site name, then click the Options tab in the resulting window (which will be named after the site you opened).
Published Date: Feb 17, 2012

Mac OS X: How to add an alert sound

This article has been archived and is no longer updated by Apple.

If you'd like to add your own alert sounds to Mac OS X, you can as long as your audio file is in AIFF format and has the ".aiff" extension appended to the filename. (**Note**: The suffix ".aif" is not sufficient in Mac OS X 10.1.5 and earlier.) Here's how to add your own alert sounds to your system.

1. Locate the AIFF sound file you want to use in the Finder.
2. From the **File** menu, choose **New Finder Window** to open another Finder window.
3. Select your Home folder in the new Finder window.
4. Open the Library folder.
5. Open the Sounds folder—you should now be in ~/Library/Sounds, where the tilde (~) represents your Home folder.
6. Drag your AIFF file from your first Finder window to the Sounds folder in the second Finder window.
7. From the **Apple** menu, choose **System Preferences**.
8. In the resulting window, click Sound to display its pane.
9. Click the Sound Effects tab.
10. Your sound should appear in the alert sound list; just select it to put it in use.

Tip: If you'd like to make your sounds available to other users on your computer, create a Sounds folder, put it in the Library folder at the root of your system (/Library), and drag in your AIFF files.

How to convert a sound file to AIFF format

If your sound file is not in AIFF format, you can use an audio application, such as iTunes or QuickTime Pro, that can convert sound files between formats—as long as your selected application can open and play the file that you wish to convert.

Using iTunes to convert audio files to AIFF format

1. Open iTunes (it's in the Applications folder).
2. From the **iTunes** menu, choose **Preferences**.
3. Click the Importing button.
4. From the **Import Using** pop-up menu, choose **AIFF Encoder**.
5. Click OK.
6. Hold down the Option key and from the **Advanced** menu, choose **Convert Selection to AIFF**.
7. In the resulting Convert window, navigate to and select your audio file.
8. Click Choose. iTunes begins to convert the file.
9. After iTunes finishes the conversion, drag the AIFF file from the iTunes library to either `/Users/`*`username`*`/Library/Sounds` or `/Library/Sounds` (if you are using Mac OS X 10.1.5 or earlier, be sure to change the filename extension from ".aif" to ".aiff").

You can then delete the audio file from your iTunes library if you wish (just select the file and press Delete).

Note: If you're using Mac OS X 10.0 and cannot use iTunes, you can use QuickTime Player to do the conversion as long as you've upgraded to QuickTime Pro, and the file is one that QuickTime Player can open and play.

Using QuickTime Pro to convert audio files to AIFF format

Note: Certain files that work with the Mac OS 9 version of QuickTime Player may not work with the Mac OS X version, and vice versa. For example, if you want to bring a sound from the Mac OS 9 System suitcase (also known as a "System 7 Sound") into Mac OS X, you must make the AIFF conversion in the Mac OS 9 version of QuickTime Player—not the Mac OS X version. If needed, you can open the Mac OS 9 version of QuickTime Player in the Classic environment of Mac OS X.

1. Open QuickTime Player (it's in the Applications folder).
2. From the **File** menu, choose **Import**. QuickTime 7 Pro users: From the **File** menu, choose **Open File**.
3. In the resulting dialog, navigate to and select the sound file that you wish to convert.
4. Click Open.
5. From the **File** menu, choose **Export**.
6. In the resulting dialog, choose a location to save the new file (the Desktop or your Documents folder are good choices).
7. From the **Export** pop-up menu, choose **Sound to AIFF**.
8. In the Save As field, check the file name to be sure it ends with a ".aiff" extension.
9. Click Save.

Once QuickTime has converted your file, drag the AIFF file to either `/Users/`*`username`*`/Library/Sounds` or `/Library/Sounds`.

Mac OS X 10.0: "Disconnecting: Bad packet length" Message When Using SSH

Web Sharing Update 1.0 resolves an issue that can cause a disconnection while attempting an SSH connection.
This article has been archived and is no longer updated by Apple.

Symptom

When an SSH connection is attempted, an alert box with this message appears:

> "Disconnecting: Bad packet length"

The SSH software then quits.

Solution

Download and install Web Sharing Update 1.0.

For information on obtaining and installing this software, please see:

Technical document 106408: "**Web Sharing Update 1.0: Before You Install Information**"
Published Date: Feb 17, 2012

Mac OS X 10.0, Sherlock: "An unexpected error occurred" Message

Use the steps in this article to resolve a repeating message in Sherlock that says "An unexpected error occurred."
This article has been archived and is no longer updated by Apple.

Symptom

When you open Sherlock or make it the active application, an alert box with this message appears:

> "An unexpected error occurred. If you continue to encounter problems, quit and start again."

If you click OK, the same message returns.

Solution

Update to Mac OS X 10.1.

The following section applies to Mac OS X versions 10.0 to 10.0.4.

This issue can be caused by having a graphic file on the clipboard, which is the result of using the Copy or Cut command. To resolve the issue, put something that isn't a picture on the clipboard. You may follow these steps:

1. Switch to an application other than Sherlock, such as the Finder.
2. Highlight some text with the pointer.
3. Choose Copy from the Edit menu.
4. Click OK in the Sherlock alert box.

The message should not recur after completing these steps.
Published Date: Feb 17, 2012

Macintosh Manager: Offline Documents Behavior

This article describes the Offline feature and how it behaves with specific versions of Macintosh Manager.
This article has been archived and is no longer updated by Apple.

Working offline

The "Work offline" feature allows users to work on client computers while the Macintosh Manager server or any additional Workgroup Documents server(s) is unavailable.

Macintosh Manager 1.x

There are two offline options in Macintosh Manager 1.x (Figure 1).

1. 'Work offline if the Macintosh Management Server is not available."
2. "Work offline if the workgroup's data volume is not available."

Figure 1 Offline options for Macintosh Manager 1.x

Macintosh Manager 2.x

There are also two offline options in Macintosh Manager 2.x (Figure 2).

1. 'Work offline if the Macintosh Management Server is not available."
2. 'Work offline if the user's home directory is not available."

These options are specific to computer lists and are found in the Computers: Security pane of the Macintosh Manager application.

Figure 2 Offline options for Macintosh Manager 2.x

If users save their documents to a disk that does not reside on the Macintosh Manager server, then the option to 'Work offline if the workgroup's data volume is not available" may be used to allow these users to work offline.

Entering "Work offline" mode

When the Macintosh Manager server is unavailable:

1. A Macintosh Manager user attempts to log in while the Macintosh Manager server is unavailable.
2. A dialog box appears with four buttons: Pick Server, Offline, Finder, Shut Down (Figure 3).
3. Click Offline.

Note: If the option to "Require an Administrator password to work offline" has been selected, the user is prompted for an Admin user password. Clicking Pick Server or Finder also brings up a dialog requiring an Admin user password to continue.

Figure 3 Choices when Macintosh Manager server is unavailable

When an additional Workgroup Documents server is unavailable:

1. A Macintosh Manager user attempts to log in while the Workgroup Documents server is unavailable.
2. A dialog box appears asking if the user wishes to work offline (Figure 4).
3. Click Yes.

Note: Clicking No cancels the login and take you back to the login screen or shut down the client computer (Macintosh Manager versions 1.3 and

earlier).

Figure 4 Choices when Workgroup Documents server is unavailable

Server interruption while working

If the Macintosh Manager server or the Workgroup Documents server becomes unavailable while a user is logged in, the user must log out and back in to work offline. Any unsaved data will be lost when logging out in this situation, unless the user has write access to another local or remote disk.

Document storage location

Macintosh Manager stores user's documents on the client's startup disk while working offline. Versions 1.x to 2.x store documents in different locations.

Macintosh Manager 1.x offline documents location:

ClientDiskName: Users: UserName: Documents:

Macintosh Manager 2.x Offline documents location:

ClientDiskName: Users: UserName: Offline Documents:

After working offline

When the Documents Server becomes available again, Macintosh Manager 1.x users must log out and log back in on the same client computer, then manually copy the items they saved while offline to their documents folder on the server. Restricted Finder and Finder users can navigate to their offline documents folder and copy data to their documents folder. Panels users must open the document with an application and then perform a 'Save As' to save the data in their documents folder.

Macintosh Manager 2.x will copy the documents from the Offline Documents folder to the user's Documents folder automatically. To do this, users must log out and then log back in on the same client computer.

Mac OS X: How to View Memory Usage With the "top" Utility

You may use the top utility in a Terminal window to monitor the usage of RAM, virtual memory, and CPU cycles, in addition to other statistics.
This article has been archived and is no longer updated by Apple.
This article offers an advanced technique. You may perform similar monitoring with the ProcessViewer application. For information on using the ProcessViewer for this task, please see technical document 106386: "**Mac OS X 10.0: How to View Memory Usage and Installed RAM**"

Viewing memory usage with top

1. Open Terminal (located at /Applications/Utilities/).
2. Type: `top`
3. Press Return to open the top utility in the Terminal window. Two rows near the top of the window, "PhysMem:" and "VM:" indicate overall physical RAM and virtual memory usage, respectively. The two columns on the right, "RSIZE" and "VSIZE" offer memory usage information per application. RSIZE indicates the amount of physical RAM in use by the application or process, in megabytes ("M") or kilobytes ("K"). VSIZE indicates the amount of virtual memory Mac OS X has assigned for this process or application, in megabytes ("M") or gigabytes ("G").
4. When you are finished reviewing the information, press the Q key to exit top.

Notes

1. Application and process names are listed in the "COMMAND" column.
2. It is normal for some processes to use very little RAM, such as 64K.
3. Not all applications may have an easily-recognizable name in the Terminal window. For example: Microsoft Internet Explorer 5.1 appears as "Internet E."
4. As with Process Viewer, Classic applications do not appear individually in the Process Listing window. It is normal for the Classic environment to appear as a single process (TruBlueEnv).
5. top itself is listed because it is an open application. This is normal.
6. Type "`man top`" in the Terminal for more information on top.

Mac OS: About Folders, Directories, and Pathnames

Sometimes it is helpful to describe a file or folder by its pathname. This article discusses the relationship between folders, pathnames, and directories.
This article has been archived and is no longer updated by Apple.

Overview

The Mac OS Finder allows you to navigate a file system with easily recognizable file and folder icons. The Finder is all you need to know about the file system for daily usage of your Macintosh. However, you may occasionally need to perform an administrative task described in terms of directories and pathnames. Readers and writers of technical documents can locate a file or directory precisely and efficiently by using a pathname.

What is a directory?

A **directory** is a file that lists the names of items contained on a disk or other piece of storage media. The directory does not actually contain these items, but it does contain information that tells the operating system how to find the item on the disk. A directory can list different types of files, including other directories, meaning that the directory structure of a disk can be multi-tiered.

Expert users can view a text-only directory with tools such as the Terminal application (Figure 1).

Figure 1 Directory listings in a Terminal window

The top directory of a disk is called the **root** directory. Other directories branch from the root, which you could diagram like a family tree or tournament bracket. Each file on the computer is assigned to one directory, like a leaf on a branch. File systems structured like this are frequently described as **hierarchical**. When describing the position of one directory to another, you may use the terms **subdirectory** and **parent directory**. For example (Figure 1):

- Documents is a subdirectory of the Home directory (~).
- root (/) is the parent directory of the Users directory.

What is a folder?

A folder is the graphical representation of a directory. Together with the Finder (Figure 2), folders provide an easily understood way to see and manipulate a file system. Moving an item in or out of a folder in the Finder changes the underlying directory. The terms **folder** and **directory** are sometimes used interchangeably, when the distinction is not relevant.

Figure 2 Folders in the Finder Column View

Note: It is normal for the Finder to display fewer folders than there are directories listed in the Terminal. This enhances simplicity by hiding items which are only used by the operating system.

What is a pathname?

To find a file or folder, you follow a particular path. As in Figure 2, you might open the Mac OS X disk, then the Users folder, then the folder with your user name (or **Home directory**), and finally your Desktop folder. A **pathname** is simply a concise way to identify a folder by both its name and its location in the file system. This is important when files and folders have the same name and can only be differentiated by location. Mac OS X, for example, has four or more folders named "Fonts" that can only be identified by pathname.

Absolute pathname

An **absolute pathname** gives an exact location by including the name of every folder in the path from the root of the disk to the item being named. For example, the absolute pathname of the Desktop folder in Figure 2 would be:

    /Users/mdh/Desktop

Note that the root of the disk is represented simply by the first solidus, or "slash," symbol. Each subsequent solidus marks a division between the names of nested folders.

Relative pathname

A **relative pathname** is described from the current location. If you were the user mdh and you selected the Users folder (Figure 2), then the relative pathname for the Desktop folder would be:

mdh/Desktop

Special abbreviations: the Home directory (~/) and root directory (/)

It is conventional to use the tilde (~) character to represent the Home directory. For example, you could note that each user can install personal fonts at ~/Library/Fonts/ in Mac OS X. The tilde may refer to Home directories stored on your computer or on a network server.

It conventional to represent the root directory with the first solidus (/) character in an absolute pathname.

Punctuation of pathnames: solidus (/) versus colon (:)

For Mac OS X and other UNIX or UNIX-like operating systems, it is conventional to use the solidus (/) character to mark the division of names. In earlier versions of Mac OS, it is conventional to use a colon. A Mac OS 9 pathname would look like:

System Folder: Preferences: Sherlock Prefs: Sherlock Defaults
Published Date: Feb 19, 2012

Mac OS X Server 10.0: httpd Processes Can Refuse to Quit

Depending on load, the Apache Web server may create additional instances of itself. Sometimes the additional instances of Apache do not quit as expected.
This article has been archived and is no longer updated by Apple.

Symptom

ProcessViewer or top indicates that many instances of httpd process are running when the server is under light load.

Solution

Use **one** of the following solutions (A or B).

A. Disable logging

If you do not need a log, you may disable logging by using Server Admin. Follow these steps:

1. Click the Internet tab in Server Admin.
2. Click the Web icon and choose Configure Web Service.
3. Click the Sites tab.
4. Select the site for which logging is to be disabled.
5. Click Edit.
6. Click the checkboxes to deselect both "Enable access log" and "Enable error log."
7. Click Save.

Note: If you are hosting more than one Web site, you should change this setting for each site.

B. Change the logging method

If you need a log, follow these steps to change the method that Mac OS X Server uses to log Web server information. The script presented here logs one week of data and then deletes the oldest log file.

First, disable the logs' Archive feature if it is enabled. Follow these steps:

1. Click the Internet tab in Server Admin.
2. Click the Web icon and choose Configure Web Service.
3. Click the Sites tab.
4. Select the site for which logging is to be modified.
5. Click Edit.
6. Be sure that both checkboxes for Archive are deselected.
7. Click Save if you made a change.

Note: If you are hosting more than one Web site, you should change this setting for each site.

Next, you need to edit the /etc/daily file. Follow these steps:

1. Open Terminal (located at /Applications/Utilities/)
2. Type: `pico /etc/daily`
3. Press Return
4. At the end of the file, paste in the following segment of script:

Begin copying below this line.

```
echo ""
echo -n "Rotating Apache log files:"
cd /var/log/httpd
for i in httpd.log; do
if [ -f "${i}" ]; then
echo -n " ${i}"
```

```
if [ -x /usr/bin/gzip ]; then gzext=".gz"; else gzext=""; fi
if [ -f "${i}.6${gzext}" ]; then mv -f "${i}.6${gzext}" "${i}.7${gzext}"; fi
if [ -f "${i}.5${gzext}" ]; then mv -f "${i}.5${gzext}" "${i}.6${gzext}"; fi
if [ -f "${i}.4${gzext}" ]; then mv -f "${i}.4${gzext}" "${i}.5${gzext}"; fi
if [ -f "${i}.3${gzext}" ]; then mv -f "${i}.3${gzext}" "${i}.4${gzext}"; fi
if [ -f "${i}.2${gzext}" ]; then mv -f "${i}.2${gzext}" "${i}.3${gzext}"; fi
if [ -f "${i}.1${gzext}" ]; then mv -f "${i}.1${gzext}" "${i}.2${gzext}"; fi
if [ -f "${i}.0${gzext}" ]; then mv -f "${i}.0${gzext}" "${i}.1${gzext}"; fi
if [ -f "${i}" ]; then mv -f "${i}" "${i}.0"; fi
touch "${i}" && chmod 640 "${i}"
/usr/sbin/apachectl restart
if [ -x /usr/bin/gzip ]; then gzip -9 "${i}.0"; fi
fi
done
```

End copying above this line.

5. Save the file (press Control-O), press Return, and exit pico (press Control-X).

Note: This will stop the Web server momentarily to let it start logging to the new files.

AirPort and AirPort Extreme: Certified by Wi-Fi

All AirPort and AirPort Extreme products are Wi-Fi certified. Wi-Fi certification ensures interoperability between various manufacturers' 802.11b wireless networking products.
This article has been archived and is no longer updated by Apple.
The term Wi-Fi (Wireless Fidelity) is often used in discussions of 802.11 networks. It refers to certification by the Wi-Fi Alliance, an international nonprofit association of 802.11 product vendors. 802.11 products that receive Wi-Fi Certification have been tested and found to be interoperable with other certified products. That means you can use your Wi-Fi certified product with 802.11 Wi-Fi Certified networks, whether they are Mac or Windows-based networks. Although 802.11 products that don't have Wi-Fi Certification may work fine with certified devices, the Wi-Fi Certified logo is your assurance of interoperability. AirPort Extreme is Wi-Fi Certified for 802.11b and 802.11g, which means that it works with any 802.11b or 802.11g Wi-Fi Certified products.

Apple is a member of the Wireless Ethernet Compatibility Alliance (WECA), which provides the Wi-Fi certification. You can find a list of certified Wi-Fi products at the Wi-Fi Alliance web site (http://www.wi-fi.org/).

Mac OS X 10.0: Kernel Panic When Using Matrox RTMac Card

Matrox has developed a firmware update to resolve an issue that causes frequent kernel panics with Mac OS X.

This article has been archived and is no longer updated by Apple.

Symptom

Mac OS X experiences frequent kernel panics when a Matrox RTMac card is installed.

Solution

Matrox has released a firmware update for the RTMac card that addresses this issue. You can download it from:

Matrox RTMac software updates
http://www.matrox.com/video/support/rtmac/software/downloads/software.cfm

Note: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.0: Classic Quits Unexpectedly When TCP/IP Is Set Up to Use a Hosts File

The Classic environment does not start up properly if the TCP/IP control panel is set up to use a hosts file.

This article has been archived and is no longer updated by Apple.

Symptom

The Classic environment appears to start up, but then it quits and is not available for Classic applications.

Solution

Note: This particular solution applies only if you have placed your TCP/IP control panel in the Advanced User Mode and used the Select Hosts File feature.

This issue occurs if the last line of the hosts file contains an entry for a computer. You can resolve the issue by adding a blank line to the hosts file after the last computer entry.

Published Date: Feb 17, 2012

Mac OS: "Startup Disk no longer has a valid System Folder"

If the Mac OS 9 System Folder becomes unblessed and you choose Restart from the Special menu, an alert message appears that the "Startup Disk no longer has a valid System Folder."
This article has been archived and is no longer updated by Apple.

Symptom

When you try to restart the computer, an alert box appears with the following message:

> "The startup disk no longer has a valid System Folder.
> "'System' and 'Finder' must be in the System Folder. If you continue, you may not be able to restart the computer. Do you want to continue?"

You may also find that some fonts displayed on screen have jagged edges, and the items in the Apple menu after "About this application..." may not be present.

Solution

Important: This solution deals with the Mac OS 9 "System Folder". When Mac OS 9 and Mac OS X are installed on the same computer, there is another folder at the top (root) level of the hard drive named just "System". The System Folder contains Mac OS 9 software components, and the System folder contains Mac OS X software components. Do not confuse the two folders.

The symptom can happen if:

- The System and/or Finder files are not in the same System Folder.
- The System and Finder files are damaged.
- You are using versions of the Startup Disk control panel earlier than 9.2 to select a Mac OS X startup disk.
  Note: You should use Startup Disk 9.2.1 or later.

Choose a set of steps to match your situation (A or B):

A. Use these steps if you are starting up alternatively from Mac OS 9 and Mac OS X and your System Folder otherwise appears to be intact.

1. Click the Cancel button in the alert box if it is still on screen.
2. Download Startup Disk version 9.2.1 or later from Apple Software Downloads (http://www.apple.com/swupdates/).
3. Use the this version of Startup Disk to select the Mac OS X disk.

You should no longer see the alert message when restarting.

B. Use these steps if you are not using Mac OS X or if you suspect your System Folder is not intact.

1. Click the Cancel button in the alert box if it is still on screen.
2. Locate the System Folder. It is normally at the top level of your hard disk, but it might have been moved or renamed.
3. If you have located the System Folder, open it and check for the presence of two items, named "System" and "Finder."
4. If these files are not in the folder or you cannot locate the System Folder, use Sherlock to locate "Finder" and "System." (This may also allow you to locate a System Folder that has been renamed or files that have been misplaced). As necessary, return the name of the folder containing your system software to "System Folder" and/or put the System and Finder files back into this folder.
   Note: Depending on the state of your System Folder, you may not be able to open Sherlock using the Apple Menu or Command-F keyboard shortcut. In this case, you can start up from a Mac OS 9 CD-ROM disc to use Sherlock.
5. Double-click the System file.

Replacing the files in the System Folder or double-clicking the System file should re-bless (reactivate) the System Folder. You can tell a System Folder is blessed when the Mac OS logo badge appears on the folder. If the System Folder is not re-blessed by this point, you may start up from a Mac OS 9 CD-ROM and use Disk First Aid to verify and repair the hard disk. You may also need to reinstall the core Mac OS 9 operating system.

Note: A Mac OS 9 System Folder used for the Classic environment must be reinstalled by the clean installation method. See technical document 106294: "**Mac OS X 10.0: How to Reinstall Mac OS 9 or Recover From a Software Restore**"
Published Date: Feb 18, 2012

Mac OS X: Pasting Custom Icons Does Not Work in All Contexts

Mac OS X versions 10.0 to 10.0.4 do not allow custom icons for your hard disk or other volumes. Also, you cannot paste a custom icon on a file that has no resource fork.

This article has been archived and is no longer updated by Apple.

Symptom

Mac OS X versions 10.0 to 10.0.4 allow you to execute the Paste command for a custom icon in several situations in which custom icons are not allowed and do not take effect. Symptoms of this issue appear in three ways:

1. A custom icon applied to a disk volume when started up with Mac OS 9 does not appear when started up with Mac OS X.
2. Mac OS X allows you to paste a custom icon on a disk volume, but it does not take effect. However, the custom icon is visible if you restart the computer with Mac OS 9.
3. Mac OS X allows you to paste a custom icon on a file that has no resource fork, but it has no effect. (Many files in Mac OS X do not have resource forks.)

Solution

Updating to Mac OS X 10.1 resolves part of Symptom 2, described above.

In Mac OS X 10.1, you can paste custom icons on a volume. However, the icon is stored in a different place than the icon used by Mac OS 9. This means you can have both a Mac OS 9 custom icon and a Mac OS X custom icon. The icon you see depends on whether the computer is started up from Mac OS 9 or Mac OS X.

Where custom icons are stored

The icon for a Mac OS X volume is stored in a file called ".VolumeIcon.icns " on the root level for that volume. This file is not normally visible in the Finder. The icon for the startup volume will be /.VolumeIcon.icns, while the icon for another disk called "disk2" will be stored at /Volumes/disk2/.VolumeIcon.icns.

Published Date: Feb 17, 2012

Mac OS X, Mac OS X Server: Changing Privileges for System Software Components May Prevent Proper Startup

A computer may not start up correctly with Mac OS X if the privileges (or "permissions") have been changed for system software components. This may occur after a change of guest user privileges.

This article has been archived and is no longer updated by Apple.

Symptom

The computer does not start up properly.

Solution

Do not change the privileges for system software components. Instead, change your share point selection.

Some people change these privileges after noticing that the guest user has rights to some system software components. However, these privileges must remain in place for the computer to start up properly.

The proper way to address this concern is to make share points from individual folders, rather than making an entire disk a share point. This approach should also prevent you from making privileges changes to the entire startup disk when using the Workgroup Manager or Server Admin application included with Mac OS X Server.

For more information, see technical document 106805, "**Mac OS X: Do Not Move 'mach_kernel' or Other System-Installed Files and Folders, Some of Which Are Normally Invisible**".

Published Date: Feb 17, 2012

Mac OS X Server 10.0: Migration Issue, "niutil: can‘t open directory/groups/admin: no such directory"

Using the Mac OS X Server 1.2 Migration Tool, you may not be able to complete the export of a user list. This article includes a workaround. This article has been archived and is no longer updated by Apple.

Symptom

An alert with this message appears:

> "niutil: can't open directory /groups/admin: no such directory"

Solution

The file "Mac_OS_X_Server_1.2_Migration_Tool" is a shell script that is executable from the command line of a Terminal window. You can modify it to resolve the issue by following these steps:

1. Copy the Mac_OS_X_Server_1.2_Migration_Tool from the Mac OS X Server 10.0.3 installation CD-ROM disc to the root user's Home directory on the Mac OS X Server 1.2 server from which the users are to be exported.
2. Open the TextEdit application.
3. Choose Open from the File menu.
4. Navigate to the Mac_OS_X_Server_1.2_Migration_Tool and open it in TextEdit.
5. Search (Command-F) the document for: `/groups/admin`
6. Change this phrase to: `/groups/wheel`
7. Save the change. Be sure the file is saved as as plain text (which should be the default setting for the script file).
8. In the Workspace Manager, locate this file in your Home directory.
9. Select the file and then choose Inspector/Access from the Tools menu.
10. Click the checkboxes to select "Execute" for owner, group, and other.
11. Click OK to save the changes.
12. Open a Terminal window while logged in as root (or su to root).
13. At the root# prompt type: `cd ~`
14. Press Return.
15. Type: `./Mac_OS_X_Server_1.2_Migration_Tool > exportlist.xml`
16. Press Return.

Note: The first command takes you to your Home directory. The second command executes the modified script and puts the output into a new file named exportlist.xml. It contains groups and users, with account information and encrypted passwords.

17. Copy the exportlist.xml file to your Mac OS X Server 10.0.3 computer.
18. Open the Server Admin application.
19. Click the General tab.
20. Click the Users & Groups icon and choose Import.
21. Navigate to and select the exportlist.xml file.
22. Click Choose.

Published Date: Feb 17, 2012

Mac OS X Server 10.0: "403 Forbidden" Message When Attempting Access to a Web Page

Enter Web page names as described in this article to avoid the "403 Forbidden" message.
This article has been archived and is no longer updated by Apple.

Symptom

A Web client attempting to access a site served by Mac OS X Server receives this message:

> "403 Forbidden"
> "You don't have permission to access / on this server."

Figure 1 The "403 Forbidden" message in Microsoft Internet Explorer

Solution

Client workaround

Note: Only the administrator of the Mac OS X Server computer can resolve this issue. If you are a client, refer your Web server administrator to this article. As a workaround, you can try adding common page names to the end of the Web address, such as:

index.html
index.htm
index.php
default.html

Server Admin solution

This occurs when you have set up a Web site for multiple default Web pages without using required punctuation (Figure 2).

Figure 2 Incorrect: the "Default document name" field

When specifying multiple default pages in the Server Admin application, put quotation marks around the name of each document. If you wanted the Web server to try three different names when looking for a default document, you would specify the entry as in this example:

> "index.html" "index.htm" "default.html"

This would cause the Web server to use the index.html page as the default page unless that document doesn't exist, in which case it would try index.htm and then default.html. Figure 3 demonstrates how the server should look if set up for to search for two page names.

Figure 3 Correct: the "Default document name" field with quotation marks

Mac OS X: DSL/PPPoE Frequently Asked Questions (FAQ)

This document answers common questions about connecting to the Internet with Mac OS X and a DSL modem, using the PPPoE protocol.
This article has been archived and is no longer updated by Apple.

Questions answered in this document:

1. What is DSL?
2. What is PPPoE?
3. With Mac OS 9, I used PPPoE software provided by my ISP. How do I use this software with Mac OS X?
4. What if the ISP tells me that their DSL/PPPoE software does not work with Macintosh computers?
5. Where can I find more information?

Question 1: What is DSL?

Answer: A Digital Subscriber Line is a popular medium for delivering high-speed Internet connections. Physically, it looks like a phone line. A DSL modem, normally provided by your Internet service provider (ISP), bridges this line to an RJ-45 Ethernet port like the one on your computer. You then connect your computer to the DSL modem using an Ethernet cable.

Question 2: What is PPPoE?

Answer: PPPoE is the abbreviation for Point-to-Point Protocol over Ethernet. PPPoE is the protocol that your ISP uses to transmit information to and from a computer. Some DSL-based ISPs may not call PPPoE by name, but this information is relevant if you use a DSL modem and are required provide a user name and password in order to connect to the Internet.

Question 3: With Mac OS 9, I used PPPoE software provided by my ISP. How do I use this software with Mac OS X?

Answer: With Mac OS X, you do not need to use such software. This function is part of Mac OS X. Follow the instructions in technical document 106282: "**Mac OS X 10.0: Setup Assistant Does Not Accommodate DSL User Name and Password**"

Question 4: What if the ISP tells me that their DSL/PPPoE software does not work with Macintosh computers?

Answer: You do not need connection software when using Mac OS X, so this does not affect you. Most ISPs only require the correct user name and password when your computer connects to their service. Mac OS X can do this without any additional software. Follow the instructions in technical document 106282: "**Mac OS X 10.0: Setup Assistant Does Not Accommodate DSL User Name and Password**"

Question 5: Where can I find more information?

Answer: More information on DSL should be available from your ISP.

Published Date: Feb 20, 2012

Mac OS X: Frequently Asked Questions (FAQ) for PPP Modem Connections

This document answers frequently asked questions about using a conventional (analog) telephone line modem to connect to the Internet via the Point-to-Point protocol (PPP).
This article has been archived and is no longer updated by Apple.
Note: In order to connect to the internet, you must have the proper configuration information from your Internet service provider (ISP). You may have entered this information the first time you used Mac OS X, when the Setup Assistant prompted you to enter the Internet connection information provided by your ISP.

Questions answered in this document:

1. What is PPP?
2. What is an example of an analog telephone modem?
3. How can I connect to or disconnect from my ISP?
4. How can I set up Mac OS X to automatically dial my ISP and connect to the Internet when needed?
5. When does Mac OS X attempt to connect to the Internet?
6. My ISP provided me with PPP access software that works with Mac OS 9. How do I make it work with Mac OS X?
7. What if my ISP tells me that their software doesn't work with Macintosh computers, or doesn't work with Mac OS X?
8. How can I change the phone number I use to connect to my ISP?
9. Do I need to buy a modem?
10. How is an analog modem connection different from a cable modem or a DSL modem connection?
11. What do I do if my computer pauses for a long time before finally connecting?
12. What if I cannot connect at all?
13. Where can I find more information?

Question 1: What is PPP?

The Point-to-Point protocol is a method used when communicating data between computers via dial-up modem connections.

Question 2: What is an example of an analog telephone modem?

Any modem that uses a conventional voice (analog) phone line to connect to your ISP's server or to another computer. "Dial-up" also describes this method. Formerly, the analog modems were the only ones available to consumers. They must now be distinguished from other types of modems. You may also see "56K modem," referring to the maximum analog speed of 56 kilobits per second. **Note:** In the United States, FCC regulations limit connection speed to 53 Kbps .

Question 3: How can I connect or disconnect from my ISP?

Use the Internet Connect application, located in the Applications folder. For more information, please see technical document 106717, "**Mac OS X: How to Connect to the Internet via PPP (Dial-Up Access) Using a Modem**."

Question 4: How can I set up Mac OS to automatically dial my ISP and connect to the Internet when needed?

1. Choose System Preferences from the Apple menu.
2. Click the Network icon.
3. Be sure the Show pop-up menu is set to your modem (the "Configure" menu prior to Mac OS X 10.1), or other dial-up device.
4. Click the PPP tab.
5. Click PPP Options.
6. Click the checkbox to select the "Connect automatically when starting TCP/IP applications" option.
7. Click OK.
8. Click Apply Now ("Save" prior to Mac OS X 10.1).

Question 5: When does Mac OS X attempt to connect to the Internet?

Using a Web browser or email application are the two most common reasons. But Mac OS X also attempts an Internet connection to:

- download current Mac Help information, including Late-Breaking News.
- use the Software Update feature.
- perform a Sherlock Internet search.
- set your clock using a network time server.

These are only examples. You may use the Internet in many other ways. You should expect a delay of several seconds while connecting (or while reconnecting after a disconnection).

Question 6: My ISP provided me with PPP access software that works with Mac OS 9. How do I make it work with Mac OS X?

Mac OS X does not require the PPP access software that your ISP may have provided. The System Preferences and Internet Connect applications can store all necessary information for making a PPP connection.

Question 7: What if my ISP tells me that their software doesn't work with Macintosh computers, or doesn't work with Mac OS X?

Your ISP may not have Mac OS-specific software, but the good news is that you do not need it. Most ISPs only require that you provide the correct user name and password when your computer connects to their service. Mac OS X can do this without any additional software.

Question 8: How can I change the phone number I use to connect to my ISP?

Use the Internet Connect application, located in the Applications folder. If you do not see the Telephone Number, Name, and Password text fields, click the disclosure triangle to the right of the Configuration pop-up menu.

Question 9: Do I need to buy a modem?

Most Mac OS X-compatible computers include an internal Apple 56K modem. All iMac and iBook computers include one. To see if you have a modem, look on the back or side of your computer for the modem port. The port looks like a standard telephone jack, and it is marked with a phone symbol.

Figure 1 Ports of an iMac

If you do not have a modem, you may wish to consider purchasing a USB modem. You can search the Macintosh Products Guide for modems (http://guide.apple.com/).

Question 10: How is an analog modem connection different from a cable modem or a digital subscriber line (DSL) modem connection?

- Speed - Most cable and DSL connections range from 384 Kbps to 6 megabits per second. Speed varies significantly by ISP, service plan, user density, and other factors. In the United States, the maximum FCC approved speed of an analog modem built to the v.90 standard is 53 Kbps, though it is normal if your modem connects at a slower speed due to phone line conditions. In practice, this means that you can load Web pages and download files 10 to 110 times faster by using cable or DSL service.
- Constant Connection - Cable and DSL connections are always active, which means you do not have to wait for the modem to connect to the Internet. They also leave your phone line free. An analog modem must place a phone call to your Internet service provider at the beginning of each connection session. A phone line in use by an analog modem cannot be used for any other purpose, such as receiving phone calls, without the use of additional hardware and/or software.
- Connecting to Your Computer - Analog modems connect via serial port, USB, or internal modem slots. Cable and DSL modems connect to your computer via Ethernet, the same type of high-speed wiring used in office networks.
- Sound - Cable and DSL modems are normally quiet. Analog modems can usually be set up to amplify their dial-up and negotiation sequences.

Note: Mac OS X 10.0 through 10.0.4 do not have an analog modem sound feature. Please see technical document 106162: "**Mac OS X 10.0: Internal Modem Makes No Sound When Connecting**"

Question 11: What do I do if my computer pauses for a long time before finally connecting?

Your computer may pause before ultimately connecting to your Internet service provider. A spinning disc cursor may appear. If you experience this issue, try updating to Mac OS X 10.1.5. See software download document 106888, "**Mac OS X Update 10.1.5: Enhancements and 'Before You Install' Information**".

Question 12: What if I cannot connect at all?

If you are unable to connect, please see technical document 106928, "**Macintosh: Apple Internal Modem Cannot Establish or Maintain a Connection to Some ISPs**."

Question 13: Where can I find more information?

More information should be available from your ISP.

Published Date: Feb 20, 2012

Mac OS 9.2.2: Provides Improved Mac OS X Compatibility

The Mac OS 9.2.2 Update improves Classic application compatibility in Mac OS X and delivers improved support for Macintosh computers that are based on the PowerPC G3 and G4 microprocessors.
This article has been archived and is no longer updated by Apple.
You should install the Mac OS 9.2.2 Update if you use applications in the Mac OS X Classic environment. Mac OS 9.2.2 is compatible with Mac OS X 10.1 or later.

Updates must be installed in the correct sequence. For assistance, see technical document 75288, "**Mac OS 9: Available Updates**".
Published Date: Feb 17, 2012

Mac OS 9.2.1: System Requirements

This article describes computer hardware requirements for using Mac OS 9.2.1.
This article has been archived and is no longer updated by Apple.
Mac OS 9.2.1 requires one of the following Macintosh computers:

- Power Mac G4 or Macintosh Server G4 (all models)
- Power Macintosh G3 or Macintosh Server G3 (all models)
- iMac (all models)
- iBook (all models)
- PowerBook (all models later than the original PowerBook G3)

Notes

1. Identifying PowerBook computers: All PowerBook computers that work with Mac OS 9.2.1 have a large, white Apple logo on the outside of their display lids.

2. Computers with microprocessor upgrade cards are not supported by Apple with Mac OS 9.2.1. Though Mac OS 9.2.1 may install and appear to function normally on some computers with third-party microprocessor upgrade cards, Apple does not provide technical support or assistance for Mac OS 9.2.1 when used in this way. Contact the manufacturer of your microprocessor upgrade card for support information.

Additionally, the computer should have:

- 320 MB or more of free hard disk space for an easy install. The amount may be greater with a Custom Install. For related information, please see technical document 106082: "**Mac OS 9.1, 9.2, and 9.2.1: Hard Disk Space Requirements**"
- At least 32 MB of RAM with virtual memory set to 64 MB.

  Note: The minimum amount of RAM will let the computer perform only at minimum speeds. Installing additional RAM will increase the system performance. With virtual memory turned off there may be up to a 10 MB difference in RAM usage. This difference is normal and due to code-mapping. For more information, please see technical document 15854: "**Virtual Memory: How It Differs On Power Macintosh**"

Notes on use with Mac OS X Server

- MacOS.app, a part of Mac OS X Server 1.x, does not work with Mac OS 9.2.1.
- NetBoot images on Mac OS X Server work but require a Mac OS 9 license for each NetBoot client.

Published Date: Feb 19, 2012

Mac OS X Server 10.0: Blue Flashing Screen at Login Window

A particular privilege change to the root level of the server startup disk causes the server to stop responding at the Login Window.
This article has been archived and is no longer updated by Apple.

Symptom

During startup, the server stops responding at the Login Window. You see a flashing blue screen.

Solution

This occurs if you change the privileges on the root level of the server's startup disk to take away read access for "Everyone." Follow these steps to resolve this issue:

1. Shut down the computer.
2. Press the power key and then immediately press and hold the Command (Apple) and V keys. This will cause the computer to start up in verbose mode.
3. Open the Server Admin application from another computer, which must have a TCP/IP route to the server.
4. Connect to the server using Server Admin.
5. Click the General tab and then choose Set Sharing Attributes from the Sharing module menu.
6. Select the server's startup disk and set the privileges for Everyone to "Read only."
7. Restart the server.

Note: You may use an SSH connection ("sudo reboot" command) from the Admin computer to restart the server, or perform a force restart using the reset button at the server.

Published Date: Feb 17, 2012

Mac OS X Server: 10.0.4 Server Update Detailed

This article describes the enhancements and changes made when you install the 10.0.4 Server Update.
This article has been archived and is no longer updated by Apple.
The 10.0.4 Server Update delivers reliability improvements for Apple File Protocol (AFP) connections, printer sharing, FTP, mail and directory services. It includes MySQL and security updates to Samba. This update also improves migration and administration of user and groups, home directory settings and Macintosh Manager accounts.

The update is available via both the automatic Software Update feature and as a standalone installer. To update automatically, choose System Preferences from the Apple Menu. Click the Software Update icon and then click the Update Now button. The standalone installer is available at Apple Software Downloads (http://www.apple.com/swupdates/).

Installation Notes

The10.0.4 Update must be applied to Mac OS X Server 10.0.3 before the 10.0.4 Server Update will appear in the Software Update pane. Likewise, you must apply this update before the 10.0.4 Server Update if using standalone installers. You must have at least122 MB free disk space on the targeted volume. If either of these criteria are not met, the following message appears:

"The software "10.0.4 Server Update" cannot be installed on the computer"

After updating, remote administration requires the 10.0.4 version of Server Admin. You can copy the new Server Admin to other Mac OS X computers using AppleShare. Just drag the Server Admin application from a mounted share point to the hard disk of the desired administration computer.

OpenSSH

The 10.0.4 Server Update contains fixes to OpenSSH above and beyond what is installed with the standard 10.0.4 Update. A Mac OS X client computer will not be able to make an SSH connection to the server until you apply Web Sharing Update 1.0 to the client computer. If you have not done this, you will see this message when attempting an SSH connection:

"Disconnecting: Bad packet length"

MySQL

MySQL was omitted from the initial version of Mac OS X Server (10.0.3). The 10.0.4 Server Update includes MySQL version 3.23.32. For more MySQL information see technical document 106383: "**Mac OS X Server 10.0: How to Locate MySQL; What Is It?**"

Server Admin

Connections to servers with more than 11 IP addresses set up or aliased for a single physical network interface now work properly.

Copying privileges to share points containing a large number of files or nested directories can potentially be a lengthy operation. Certain functions of the Server Admin application are not available until this task has been completed. Visual feedback improvements were added to help indicate the current status of ongoing operations. Changes were made to the Users & Groups Administration module to prevent the display of the disabled users group. Allowing this group to be displayed visibly is undesirable since it does not connote that the act of properly disabling a user requires that their password attribute be changed. Simply moving a user to this group does not adequately disable that user.

Independently dragging users with similar names to groups via the Users & Groups Administration module could previously result in the omission of some of the desired users. Changes made in the 10.0.4 Server Update correct this.

This update corrects problems with the process of defining custom home directories in user records. Previously, the defined home directory would revert to the address of the current server despite what had been specified.

Corrects problems with garbled window title and subnet name text in the DHCP Administration module when used on a Japanese language system after having performed a duplication of subnets.

File Services

Improves AFP client connection reliability. Simultaneous disconnect of multiple connected AFP clients could occur in Mac OS X Server version 10.0.3 and could be identified by "TickleTimeoutdisconnect" errors logged to the AppleFileServiceAccess.log.

Improves AFP client behavior when connecting to directories with names containing double-byte characters. The FTP Server has been modified to the upload of files and/or directories containing double-byte characters in their names.

Corrects an issue in which attempts to create directories via FTP in home directories that are defined on volumes other than the root volume would fail.

Server update corrects some conditions in which the absolute path to a given file or directory could be revealed when specifying relative paths in commands such as ls.

Enhanced the FTP server to guard against certain types of buffer overruns.

Directory Services

Addressed memory leaks when changing the search policy or LDAP configuration.

Improved internal processes to reduce the possibility of Directory Services deadlock conditions.

Corrected problems with the Directory Setup application unexpectedly quitting that could be encountered when modifying LDAP settings after applying changes to the NetInfo checkbox.

Addressed problems with Directory Setup applying changes when attempting to add nodes to the Contacts tab. Directory Setup would previously either fail to add the specified node without warning or unexpectedly quit.

Improved LDAP plugin mappings.

Macintosh Manager

Improved the selection of default Macintosh Manager Documents server location by including previously disabled options.

Now properly displays icons in the available CD-ROMs list when administering a Macintosh Manager server on a Mac OS X system.

The addition of Mac OS X application packages containing Classic executables are now properly selected from the appropriate application from within the package to be added to the Workgroup items list.

Performed optimizations of various internal Macintosh Manager functions.

Improved behavior when dragging users from the Users and Groups list in the Server Admin application to the Macintosh Manager application's user list by removing unnecessary confirmation dialogs.

Improved Macintosh Manager application behavior on Mac OS 9.x when the computer list is displayed and the admin application is hidden in the Finder.

Now prevents local administration of Macintosh Management server (when specifying 127.0.0.1 or localhost) to ensure Macintosh Manager database integrity.

Improved logging during Macintosh Manager migrations to remove extraneous messages noting blank volume name targets.

Corrected an issue in which migration of Macintosh Manager users could result in the improper creation of a "Users" directory instead of the intended "Library" directory within their home directory.

Corrected problems administering the Macintosh Management server when more than 303 users were connected simultaneously.

Corrected problem with excessive CPU usage when Appletalk is toggled on and off while the Macintosh Management server is in use.

In addition to the enhancements to the Macintosh Manager server processes and admin application listed above, Macintosh Manager client software version 2.0.2 contains several improvements and should be used in conjunction with a 10.0.4 Server Update installation.

Mail Server

Changes to the Mail Server were made to improve the behavior experienced when mail clients conduct unusually lengthy communications (such as when deleting a large volume of messages).

Addressed a Mail Server stability issue that could occur when using the AppleShare IP Migration Tool to migrate Users & Groups and the Mail database.

Mail Server performance improvements were made through a more efficient threading implementation when posting messages to a user account.

AppleShare IP Migration application

Corrected problems with incomplete migrations of users defined in groups.

Corrected a memory leak that could occur when interacting with Directory Services during the migration process.

Print Services

Improved behavior when sorting print queues by name in the Print Monitor dialog of the Print Services administration module.

Corrected issues with attempting to add a print queue to the parent NetInfo domain. Addressed problem with rejected jobs when printing to a default queue name containing double-byte characters.

Improved print services reliability attained through more robust interaction between lpd and Directory Services.

Mac OS X Server 10.0: Accessing Users Stored in a Remote Directory via Server Admin

Use these steps to access users stored on a remote NetInfo Parent, LDAP server, or other directory via a Directory Services Plug-In.
This article has been archived and is no longer updated by Apple.
Users stored in a remote directory do not appear in the Users and Groups List of the Server Admin application. This occurs when your Mac OS X Server is bound to a NetInfo parent, an LDAP server, or another type of directory using a Directory Services plug-in. If you need to access these users follow these steps:

For a single user or group:

1. Open Server Admin.
2. Click the General tab.
3. Click Users & Groups and choose Find Users & Groups.
4. Set the pop-up menu to Search Path, which will search the Directory Services Search Path.

Figure 1 Search for a single user or group

5. Type the user or group name in the Name field.
6. Click the Find button.

For all users:

1. Open Server Admin.
2. Click the General tab.
3. Click Users & Groups and choose Find Users & Groups.
4. Set the pop-up menu to Search Path, which will search the Directory Services Search Path.
5. Click More Choices.
6. Click the checkboxes to deselect Name and select ID . Either of the two ID checkboxes will do.
7. Set the pop-up menu that corresponds to the selected ID field to Greater Than (Figure 2).

Figure 2 Search for all users

8. In the selected ID field, type: `99`
9. Click Find.

Once you have found your users, you can drag and drop them into groups or services, or view their information. Note that you will not have write access to those users, so you will not be able to edit them.

Mac OS X 10.0, 10.1: Installer Does Not Display Hard Disk

The hard disk icon of a lone ATA hard drive set up as the slave device may not appear in the Mac OS X Installer.
This article has been archived and is no longer updated by Apple.

Symptom

The Mac OS X installer does not display the hard disk icon of a hard drive that is actually connected to the computer.

Note: If your hard disk appears in the installer but looks dimmed, stop here and go to technical document 106235: "**Mac OS X 10.0: Disk Appears Dimmed (or "Grayed Out") in the Installer**"

Solution

This can happen if you have a single ATA hard drive connected to the computer and it is set up as a slave device (ID =1) instead of a master device (ID=0). If you have both a master and a slave drive connected, all volumes for both drives will appear.

To tell how your ATA drives are set up, follow these steps:

1. Choose System Preferences from the Apple menu.
2. Click the Startup Disk icon.
3. Select your Mac OS 9 System Folder.
4. Restart the computer.
5. Choose Apple System Profiler from the Apple menu.
6. Click the Devices and Volumes tab.

The ID appears to the right of the ATA bus, but to the left of the drive information. To restart your computer from Mac OS X, Choose Control Panels from the Apple menu and Startup Disk from the submenu. Select your Mac OS X disk and restart the computer.

Figure 1 Apple System Profiler

Apple does not ship computers in this configuration. To resolve this issue, set up your drive as a master device. The exact steps to do this vary from drive to drive. Most drive manufacturers post the steps to do this on their Web sites.

Tip: Try putting the model number of your hard drive in a Sherlock Web search.

You should not modify the settings of your hard drive if you are not confident in your ability to do so. Damage caused by incorrect modifications may not be covered under the Apple or third-party product warranty.

Mac OS X: Apple System Profiler Modem Information Incorrect or Missing

Apple System Profiler may omit or misreport modem information under certain circumstances. This does not indicate a hardware failure.
This article has been archived and is no longer updated by Apple.

Symptom

1. Where it should indicate a modem in the Network Overview section, Apple System Profiler indicates an additional Ethernet device with these traits:
   - address of 00.00.00.00.00.00
   - "PointToPoint" in the Flags field
2. Apple System Profiler may report the presence of a modem that does not exist.

Solution

This symptom does not indicate a hardware failure of the modem.

To troubleshoot modem connection issues, see technical document 106447: "**Mac OS X 10.0: How to Gather Modem Troubleshooting Information**"

If you suspect you have isolated a hardware issue with your built-in Apple modem, use the Apple Hardware Test software that came with your computer for verification. To identify hardware issues with a non-Apple modem, see the instructions that came with the modem.

Published Date: Feb 19, 2012

Mac OS X: How to Gather Modem Troubleshooting Information

Follow the steps in this document to gather modem troubleshooting information beyond that provided by the Internet Connect application.
This article has been archived and is no longer updated by Apple.
Note: This article only pertains to analog telephone (often called "56K") modems.

Troubleshooting and alert messages provided in the Internet Connect application may not provide adequate information. Use these steps to gather more information:

1. Open the Internet Connect application.
2. Choose Internal Modem from the Configuration pop-up menu. If you can't see the phone number, click the disclosure triangle to the right of the Configuration menu.
3. Click Edit. The Network pane of System Preferences opens.
4. Choose Internal Modem from the Configure pop-up menu.
Note: If Internal Modem does not appear in the pop-up menu, choose Advanced instead. Click the checkbox to select Internal Modem, then choose Internal Modem from the Configure pop-up menu.
5. Click the PPP tab.
6. Click PPP Options.
7. Click the checkbox to enable "Use verbose logging."
8. Click OK.
9. Click Save.
10. Click Internet Connect in the Dock.
11. Choose Connection Log from the Window menu.
12. Click Connect.

When you use the modem to connect to the Internet, a transcript of the modem activity will appear in the Connection Log window. This information can help you troubleshoot connection issues. It may be especially useful when receiving assistance from your Internet Service Provider (ISP) or a modem manufacturer.

Mac OS X: How to Set up AppleTalk Routing

This article has been archived and is no longer updated by Apple.

Use the steps in this document to set up AppleTalk routing in Mac OS X.

If your network necessitates AppleTalk routing in Mac OS X, follow these steps to set it up. This technical document presumes some knowledge of AppleTalk routing on the part of the network administrator following these steps, particularly in terms of the selection of appropriate network numbers (Phase 3, Steps 8 and 9 of this document).

Note: Apple provides phone-based assistance implementing the steps in this article to customers who have a Mac OS X Server Support contract.

Important

1. Editing the /var/db/SystemConfiguration/preferences.xml file can completely disable networking. Only edit the backup copy, created in phase 1, below.

2. You will need an XML property editor application to complete these steps. One named PropertyListEditor is available as part of Apple's Developer Tools. These instructions assume you are using PropertyListEditor. If you use another, adapt your specific steps accordingly where required.

3. You must log in to your computer as the root user to complete these steps. The root user is enabled by default in Mac OS X Server. For more information on this topic, see technical document 106290: "**Mac OS X 10.0: About the root User and How to Enable It**"

Steps to set up AppleTalk routing

Phase 1: Create a copy of preferences.xml or preferences.plist file

Note: Mac OS X Server 10.2.8 and earlier store relevant settings in the file /var/db/SystemConfiguration/preferences.xml. Mac OS X Server 10.3 and later use the file /Library/Preferences/SystemConfiguration/preferences.plist.

1. Open System Preferences and click Network.
2. Set all networking options as appropriate for your network.
Important: For Mac OS X 10.0 to 10.1.5, be sure to select the checkbox for AppleTalk on each network interface to be used for AppleTalk routing. For Mac OS X 10.2 or later, you are not allowed to select AppleTalk on more than one interface. To compensate for that, Step 9 of Phase 2 (below) contains an additional action for Mac OS X 10.2 or later
3. Write down or type the name of the Location that is selected in the Network pane of System Preferences.
Note: This is a user-definable name that may be different for everyone. The default name is Automatic. Because this can be different for everyone, we refer to it later as "YourSet." When you are instructed to type YourSet, you actually should type the name that you have noted.
4. Quit System Preferences.
5. Choose Go to Folder from the Go menu.
6. For 10.2.8 or earlier, type: `/var/db/SystemConfiguration/`
For 10.3 or later, type: `/Library/Preferences/SystemConfiguration/`
7. Click Go. You should now see the either the preferences.xml or preferences.plist file in the Finder window.
8. Select the file.
9. Choose Duplicate from the File menu. You should now have a copy named "preferences copy.xml" or "preferences copy.plist".

Phase 2: Identifying services in the file

You must edit the file to enable AppleTalk routing. The file contains a listing of "sets," which appear as Locations in the Network pane of System Preferences.

1. Open the copy you made in an XML property editor.
2. Click the disclosure triangle next to Root.
3. Look in the Value column to the right of CurrentSet (Figure 1). You should see something like: /Sets/0
Note the number that follows "/Sets/" (0 in this example). This number will be used in Step 6.

Figure 1

4. Below CurrentSet in the list that appears, you should see NetworkServices and Sets.

5. Click the disclosure triangle to the left of Sets. One or more numerals should appear below Sets (Figure 2). These numerals are the sets.

Figure 2

6. Click the triangle to the left of whichever set is current, as determined in Step 3, to reveal its children. This will reveal Network and UserDefinedName. The string in the Value column for UserDefinedName should be YourSet, as noted in Phase 1. In the Figure 3 example, this would be "Automatic."

Figure 3

7. Click the disclosure triangle to the left of Network.
8. Click the disclosure triangle next to Service (Figure 4). These are links to the NetworkServices that this Set uses. These links must be followed to the correct NetworkService, which you will identify in Step 9. You can see the links by clicking the disclosure triangles next to the numbered NetworkServices listed below Service. You should see "__LINK__ " with a value similar to "/NetworkServices/0". The number following "/NetworkServices/" corresponds to the particular service that you will identify in the next step and ultimately edit.

Figure 4

9. The third line in your Property List should be NetWorkServices (directly below Root and CurrentSet). Click the disclosure triangle next to it. Disclose the NetworkServices/x that correspond to the services linked to the CurrentSet. For each network service, the value for UserDefinedName will correspond to port name as listed in Network pane of System Preferences. A service that has AppleTalk active will have a child named "AppleTalk," and AppleTalk will not have child named "__INACTIVE__" with a value of 1. In Figure 6 for example, AppleTalk is active on network service 1 but not on network service 2.

Important: For Mac OS X 10.2 and later, you must delete the _INACTIVE_ child from all NetworkServices that will have AppleTalk enabled.

Figure 5

You have now identified the network services linked to your current set. You will edit these in the next section.

Phase 3: Editing in services

For each network service (port) identified in Steps 8 and 9 of Phase 2, follow these steps:

Note: When instructed to type something in this section, do so with the same capitalization.

1. Double-click the value for ConfigMethod
2. In the field, type: SeedRouter
Select ConfigMethod and click New Sibling .
3. Name the new sibling: SeedNetworkRange
4. In the Class column to the right of SeedNetworkRange, click String and set the pop-up menu to Array.
5. Click the triangle to the left of SeedNetworkRange
6. Click New Child twice.
7. For each new child, change the Class from String to Number.
8. Set the value of child 0 to the starting network number.
9. Set the value of child 1 to the ending network number.
10. Select ConfigMethod and click New Sibling.
11. Set the name of the sibling to SeedZones.
12. Change the class of SeedZones to Array.
13. Click the triangle to left of SeedZones and add one child for each zone name.
14. Set the class for each child to String.

15. Set the value to the zone name.

Note: The default zone for that network is child 0.

To configure a port to be a non-seed router, just set the ConfigMethod to Router. There is no need to create the SeedZones or SeedNetworkRange. This information will be gleaned from another seed router on the network segment. This configuration will only work if there is another seed router on the same network segment.

To determine the home port, the ServiceOrder for IPv4 will be used and this is the order created by arranging the interfaces in Network Preferences. If the AppleTalk home port is to be different from the primary IP interface, an AppleTalk ServiceOrder must be created using the steps below.

Phase 4 (optional): Creating an AppleTalk ServiceOrder

1. In the Property List, go to /Sets/<set ID>/Network/Global
2. Be sure that Global is disclosed, then click New Child.
3. Set the name of the child to AppleTalk and its class to Dictionary.
4. Click AppleTalk and then click New Child.
5. Set the name of the child to ServiceOrder and its class to Array.
6. Click ServiceOrder and create a child for every network interface (port).
Note: Open /Sets/<set ID>/Network/Global/IPv4/ServiceOrder for an example.
7. Change the type of every child to String.
8. The values for these children are the Service IDs from the set, and not the NetworkServices numbers.
9. Enter the services in the preferred order. The port for child 0 is the home port for the server.

Phase 5: replacing the preferences.xml or preferences.plist file

Replace the original file with the copy you have edited, being sure to correct the name to match the original, and then restart. If everything is correct, the server should now be routing AppleTalk and appear in the zone that is child 0 of the SeedZones list for the port that is specified as child 0 in the AppleTalk ServiceOrder.

Figure 6 shows two ports set up as seed routers each advertising one zone. Just add more children to SeedZones to advertise more zones. Remember that SeedZone/0 is the default zone.

Figure 6

Figure 7 shows the AppleTalk Service Order being used. This shows that the value for ServiceOrder/0 is 2. Service/2 is a link to NetworkService/2 and NetworkService/2 is for PCI Ethernet Slot 2x4, Port 1. So this server's home port in card port 1 and it will appear in zone NAT 1.

Figure 7

Macintosh Manager 2.0: Common Setup Strategies

As an alternative to using automatic migration utilities, you may use one of the two strategies presented here to achieve the greatest amount of flexibility in your server installation.
This article has been archived and is no longer updated by Apple.

Two strategies to consider

I. Single Server - One server handles both Authentication and Documents services.

II. Multiple Servers - Two or more servers share the workload of Authentication and Documents services.

Brief listing of terms used in this document

- The term "Folder" may be used interchangeably with "Directory."
- Home directory - Directory bearing a user's name, where that given user is able to store files. Macintosh Manager users must have this feature enabled in the Server Admin, or they will be unable to save files easily on the Mac OS X Server.
- Users folder - Default share point for Macintosh Manager users' Home directories.
- Mac OS X Server - Refers to Mac OS X Server 10.0 or later, unless otherwise specified.
- Macintosh Manager - Refers to Macintosh Manager 2.0 or later, unless otherwise specified.
- NetInfo - A hierarchical distributed database that is used to keep track of administrative data in Mac OS X Server. It can store information on user and group accounts, email configurations, NFS (Network File System), printers, computers and other resources.

Note: For more information on parent/child domain structures, see pages 39 to 55 of the Mac OS X Server Administrator's Guide. You can also review the Understanding and Using NetInfo whitepaper on the Mac OS X Server Web site (http://www.apple.com/macosx/server/).

Required Software and Hardware

- Mac OS X Server 10.0.4 or later. Updates are located at: http://www.apple.com/swupdates/
- For the server: Any Macintosh computer which meets the system requirements defined in technical document 106430 "**Mac OS X Server: System Requirements and Recommended AppleShare Client Software"**.
- For administration: A Macintosh computer that meets the system requirements defined in technical document 106350 "**Mac OS X Server 10.0: Server Admin System Requirements and Installation"**. The Server Admin and Macintosh Manager applications must be installed on this computer.
- For clients: Macintosh computers using Mac OS 8.1 to 9.2.1 with Multiple Users client software installed.

Assumptions

- Your network provides Domain Name Services (DNS) with reverse lookup capability.
- If Domain Name Services are not enabled on the network, it is recommended that the hostname of the Mac OS X Server be entered manually into the "machines" property as a subdirectory using NetInfo Manager. The following properties will need to be present in this subdirectory:

  ip_address (value will be valid ip address for your network)
  name (value will be a hostname for your server)

- Mac OS X Server has been installed with working a network configuration on the computer(s) that will host the Parent NetInfo Domain and/or Child NetInfo Domain(s).

I. Macintosh Manager 2.0 Single Server

Follow these steps if you wish to use a single computer to provide both of the main components of Macintosh Manager (authentication and documents service).

1. **Assigning the Default Home Directory location for your users**

a. At your administration computer, log in to the Server Admin application.
b. Click the Users and Groups icon and select Home Directory Defaults from the menu.
c. Select the Local radio button and the Users share point. This is the default configuration for this scenario. You may use any share point that you have previously created.

2. **Creating or Importing Users into Mac OS X Server Admin**

a. Import Users (.xml file) into Mac OS X Server 10.0 using Mac OS Server Admin. These files can be generated/exported from within AppleShare IP or converted to XML from an exported tab-delimited text file using third party utilities such as Passenger or MM Helper.

3. **Start services.**

Make sure the Apple File Service and Macintosh Management Services have been started in Server Admin.

4. **Adding Users to the Macintosh Manager Users List**

a. Open the Macintosh Manager application and log in as an Admin user.
b. Click the Import All button. You may also selectively drag users from the Server Admin User & Groups list to the Macintosh Manager admin list.

5. **Setup for users.**

Set up users' workgroup membership, items, privileges, etc. as appropriate. These steps roughly mirror those found in versions of Macintosh Manager prior to 2.0 and are not covered in this section.

II. Macintosh Manager 2.0 Multiple Server Environment

The most common configuration used by Macintosh Manager 2.0 administrators is a multiple server environment, where the NetInfo hierarchy is leveraged to provide scalability and organization of user data. Initial user authentication occurs on a single server (Parent from a NetInfo perspective), and the users are split amongst one or more document servers (Child from a NetInfo perspective).

Note: Read through these steps completely before setting up your servers, so that you may appropriately plan how to deploy your users and network infrastructure.

Setting up the NetInfo Hierarchy

1. **First, the Parent server must be configured.**

a. Open NetInfo Domain Setup (Applications/Utilities/) at the Mac OS X Server where your users' NetInfo records are to be maintained.
b. Click the lock and enter the Admin user name and password. You may additionally be asked to authenticate as the root user. For more information on the root user, see technical document **106361**.
c. Edit the settings to reflect the following:

This machine: is a NetInfo Parent
Find NetInfo Parent via: Static Address
NetInfo Parent Address: 10.0.1.1
NetInfo Server Tag: network

Note: Where the example shows 10.0.1.1, type the actual IP address of your authentication server.

Figure 1

d. Click Save and wait until the pointer stops spinning.
e. Quit NetInfo Domain Setup and Restart the computer.

2. **Next, the Child server must be configured.**

a. Open NetInfo Domain Setup on the Mac OS X Server where your users Home directories (documents) are to be maintained.
b. Click the lock and enter the Admin user name and password. You may additionally be asked to authenticate as the root user. For more information on the root user, see technical document **106361**.
c. Edit the settings to reflect the following:

This machine: connects to a NetInfo Parent
Find NetInfo Parent via: Static Address
NetInfo Parent Address: 10.0.1.1
NetInfo Server Tag: network

Note: Where the example shows 10.0.1.1, type the actual IP address of your authentication server.

Figure 2

d. Click Save and wait until the cursor stops spinning.
e. Quit NetInfo Domain Setup and Restart the Server.

3. **Verify parent to network binding**

The local NetInfo database on the parent should automatically bind (connect) to the network database after Step 1 above. To verify this has occurred, follow these steps:

a. Log in to the authentication Server as admin (or root)
b. Open NetInfo Manager.
c. The local NetInfo domain should open automatically.
d. The Globe-Arrow (Open Parent Domain) button should be active.

Figure 3

e. This Globe-Arrow button opens the parent NetInfo domain of the NetInfo domain you are currently viewing (local).

Figure 4

f. Click the button and open the parent, "network @ yourdomain...". This shows that yourdomain is publishing the network domain and that the local domain is a child of yourdomain/network.
g. Click on the machine entry for yourdomain. There are 3 properties shown: name, ip_address and serves. The serves property lists the NetInfo domains being hosted on yourdomain. NetInfo Domain Setup automatically populated these fields in the above steps.
h. If the above steps fail, try Steps 1 and 2 again and verify the settings in NetInfo Domain Setup on both servers.

4. **Verify child to parent binding**

To verify the child (client or server) binds to the parent NetInfo domain. Follow the above steps in item 3, but on the Document Server (the NetInfo child). The Globe-Arrow button should also be active and not grayed out when viewing the local NetInfo pane.

5. **Assign the Default Home Directory location for your users in your NetInfo root domain.**

a. Log in on the Document Server (NetInfo child) and launch Mac OS X Server Admin.
b. Open Mac OS X Server Admin and connect to the Documents Server.
c. In Server Admin, select "Home Directory Defaults..." by clicking the "Users and Groups" icon.
d. Select the "Local" radio button and the "Users" share point. This is the default configuration for this scenario. You may use any share point that you have previously created.

6. **Create or Import Users using Mac OS X Server Admin on the Documents Server (NetInfo child).**

a. Import Users (.xml file) into Mac OS X Server 10.0 using Mac OS Server Admin. These files can be generated/exported from within AppleShare IP or converted to XML from an exported tab-delimited text file using third party utilities such as Passenger or MM Helper.
b. The Users folder will automatically populate with the Home Directories from the above step. If you would like to verify that this step was successful, navigate to /YourStartupVolume/Users and see that there are newly created Home Directories.
c. Users must then be deleted from the User's & Groups list on the Documents Server (the NetInfo child).

7. **Users**

Create or Import Users using Mac OS X Server Admin on the Authentication Server (NetInfo parent).

a. Log in on the Authentication Server (NetInfo parent) and launch Mac OS X Server Admin.
b. Launch Mac OS X Server Admin and connect to the Authentication Server.

c. In Server Admin, select "Home Directory Defaults..." from /NetInfo/root by clicking the "Users and Groups" icon.
d. Select the Custom radio button and edit the fields to read:

Server: server.yourdomain.edu
Share Point: Users
Path:

Note: Leave the Path field blank. It should be populated automatically. Where the example says server.yourdomain.edu, type either the IP address or DNS name of the documents server.

Figure 5

e. The above is the default configuration for this scenario. You may use any share point located on the top (root) level of a server volume that you have previously created. This will allow Macintosh Manager to find the user's Home Directories on any Documents Server that has been previously configured.
f. Repeat Step 6-a above, except connect to the authenticationsServer (NetInfo Parent). Pay particular attention to where these users are created. These users must be created/imported into /NetInfo/root in order for Macintosh Manager to authenticate users properly.

8. **Start services.**

Make sure the Apple File Service and Macintosh Management Services are started in Mac OS X Server Admin.

9. **Additional child domains**

Repeat steps two through 8 for each NetInfo child (to be used as a Macintosh Manager Document Server).

Allowing Users to Login as Macintosh Manager Users

1. Add Users to the Macintosh Manager Users List

a. Open Macintosh Manager Admin and log into the Mac OS X Server.
b. Click Import All. You may also selectively drag users from the Mac OS X Server Admin User & Groups list to the Macintosh Manager Admin list.

2. Set up user's workgroup membership, items, privileges, etc. as appropriate. These configuration steps roughly mirror those found in versions of Macintosh Manager prior to 2.0 and are not covered in this section.

Macintosh Manager 2.0: Restoring Stand-Alone Multiple Users Capability

Reinstall Multiple Users 1.4.1 to restore standalone Multiple Users capability.
This article has been archived and is no longer updated by Apple.

Symptom

After installing Macintosh Manager 2.0.2 software on a Mac OS 9 computer, the standalone Multiple Users feature does not work. The computer seeks a Macintosh Management server after logout or startup.

Solution:

The reason for this is that release 2.0. or later of the Multi-User Startup extension does not work with the standalone Multiple Users feature. Follow these steps to restore this feature:

1. Drag these files to the desktop or Trash:
   - System Folder:Login
   - System Folder:Panels
   - System Folder:Extensions:Multi-User Startup
   - System Folder:Preferences:Mulitple Users
2. Download and install Multiple Users 1.4.1 software from Apple Software Downloads (http://www.apple.com/swupdates/).
3. Restart the computer
4. Open the Multiple Users control panel and set it up as desired.

About AppleShare IP 6.3.3

This is a reproduction of the document "About AppleShare IP 6.3.3" included with AppleShare IP 6.3.3.

This article has been archived and is no longer updated by Apple.

About AppleShare IP 6.3.3

CONTENTS

About AppleShare IP 6.3.3 System requirements Installing AppleShare IP 6.3.3 Using Web-based Remote Administration Using Mac OS Server Admin on a remote workstation Using Macintosh Manager Disk Fragmentation with Macintosh Manager Using TCP Filtering Other Recommendations

About AppleShare IP 6.3.3

AppleShare IP 6.3.3 provides support for the latest system software, Mac OS 9.1 and later, and includes these additional enhancements:

- A new version of client software, AppleShare Client 3.8.8, is provided on the AppleShare IP 6.3.3 CD.
- The maximum number of simultaneous SMB connections is increased to 500.
- SMB drives will always stay mounted on client computers connected to an AppleShare IP server.
- Reading and writing is synchronized when applications running on the server share a file with applications running on a client.

Other enhancements and bug fixes since AppleShare IP 6.3 are:

- Improved performance and increased reliability.
- Client computers that connect to the server using SMB can always view all items available in a directory.
- Improved performance of the IMAP server.
- You can enable the "Start server on system startup" checkbox after using the AppleShare IP 6.3.1 Update package.
- Improved file server security against denial of service attacks.
- You can use Mac OS Admin remotely to change a folder's explicit privileges. In previous versions you could not do this if you set a folder to inherit access privileges of the enclosing sharepoint.
- A security fix to the web server in versions of AppleShare IP 6.1 and later. Invalid range requests are handled correctly.

System Requirements

To install or upgrade to AppleShare IP 6.3.3 you must have a Power Macintosh G4 Cube, iMac, Power Macintosh, Macintosh Server, or Workgroup Server with a PowerPC G4, G3, 604e, 604, 603e 6500 series, or 601 microprocessor that has the following installed:

- Mac OS 9.1 OR Mac OS 9.1 with Mac OS ROM 6.7.1 (Multi-processor Macintoshes must have Mac OS 9.1 with Mac OS ROM 6.7.1 for support with AppleShare IP 6.3.3. See Note below.)
- AppleShare IP version 6.3 or later
- For Client machines, Apple recommends using AppleShare Client 3.8.8. If the client machine does not already have version 3.8.8 installed, follow the instructions provided in the About AppleShare Client 3.8.8 document provided on the AppleShare IP 6.3.3 CD to install version 3.8.8.

Installing AppleShare IP 6.3.3

1. Install Mac OS 9.1 or later.

You can download this version from the Apple Web site at www.apple.com/support or purchase the Mac OS 9.1 CD and related documentation at www.apple.com and select the "Store" tab.

2. Follow the instructions for installing and setting up AppleShare IP found in the Getting Started manual and Late Breaking News.

Using Web-based Remote Administration

- Make sure AppleTalk is active before you use Web-based Remote Administration.

Using Mac OS Server Admin to administer your server from a remote workstation

To administer an AppleShare IP 6.3.3 server, you must install Mac OS Server Admin version 6.3.3 on each workstation from which you want to administer the server. You can't use an older version of Mac OS Server Admin to administer an AppleShare IP 6.3.3 server. However, you can use the newer version of Mac OS Server Admin to administer any server that has AppleShare IP 6.3, 6.3.1 or 6.3.2 installed.

Using Macintosh Manager

When using Macintosh Manager, workgroups should be configured to look for applications only on the client computers. In the Macintosh manager administration application, log in as the Administrator, select the Workgroups tab, and then select the Items tab. For all workgroups, Find chosen items: should be set to only on local volumes. Click on the Save button and quit the Macintosh Manager administration application.

Disk Fragmentation with Macintosh Manager

AppleShare IP Server hard disks can become extremely fragmented when using Macintosh Manager due to the large number of client files, particularly on the servers that store user documents. This will decrease server performance. If you have DiskWarrior or Norton Speed Disk, it is a good idea to defragment your disk to improve performance. Defragmenting a large, full disk drive may take up to several hours.

Using TCP Filtering

Under heavy load on 100 MB Ethernet networks, the TCP Filtering software may cause server freezes or client file copies to hang. If this occurs frequently, you should disable TCP Filtering and remove the "OT Auto Push Support" extension from the Extensions folder in the System Folder.

Other Recommendations

If you are using an AppleShare IP Server with heavy load, or running it in conjunction with Macintosh Manager, check your server configuration for the following:

- Remove Epson Launcher from the Extensions folder.
- On the server computer, turn off Remember recently used items in the Apple Menu Options control panel.
- In Sherlock, select Index Volumes from the Find menu and select the Schedule button. Disable indexing for all days.
- Turn off virtual memory in the Memory control panel.

There is a known issue between some third party networking software and AppleShare IP servers running the Open Transport SNMP extensions. If the AppleShare IP Server stops responding at regular intervals, usually at night, Apple recommends that the SNMP extensions be removed or disabled.

Mac OS X Server: How to Set up NetBoot to Use An Existing DHCP Server

This document provides instructions for configuring NetBoot services in Mac OS X Server 10.0.3 or later to use an existing DHCP server.
This article has been archived and is no longer updated by Apple.
Each computer that you plan to start up from your NetBoot Mac OS X Server needs an IP address to identify it as a unique device on the network. With NetBoot over DHCP, a second generation of NetBoot, client computers can obtain their IP addresses using DHCP. Only later models of NetBoot-capable Macintosh computers can take advantage of this feature. To see which computers are capable of NetBoot over DHCP, please see technical document 106430, "**Mac OS X Server 10.0: System Requirements and Recommended AppleShare Client Software**".

Mac OS X Server is configured by default to provide DHCP server services when enabling NetBoot services. You should only have one DHCP server per network subnet.

To disable DHCP services on Mac OS X Server and use another existing DHCP server on your network, follow these steps:

1. Log in to Server Admin if you are using Mac OS X Server 10.1.5 or earlier. Log in to Server Settings if you are using Mac OS X Server 10.2 or later.
2. Click the Network tab.
3. Click the DHCP/NetBoot icon and choose Configure DHCP.
4. Click the Subnets tab.
5. Double click the default subnet, listed under the Name column.
6. Click the check box to deselect Enable DHCP.
7. Click button and close both windows.
8. Click the DHCP/NetBoot icon and choose Start DHCP Service.

Published Date: Feb 17, 2012

Macintosh Manager 2: Using Macintosh Manager in a Kerberos Environment

This article describes the procedures for setting up Macintosh Manager 2 clients and servers to integrate with environments that require Kerberos authentication.
This article has been archived and is no longer updated by Apple.
Note: Some of the following information pertains to setting up a third-party product. Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor or developer for additional information. This document contains links for getting relevant software and information from the Massachusetts Institute of Technology (**MIT**).

Macintosh Manager 2.0 introduced the ability for Macintosh Manager clients to authenticate against servers supporting the v4 and v5 releases of the Kerberos protocol. This feature allows Macintosh Manager administrators to restrict client workstation access to only those users holding valid Kerberos passwords. With Kerberos enabled, Macintosh Manager client users will retain a ticket-granting-ticket upon successful login to use with other Kerberos-aware services.

System Requirements

- Macintosh Manager 2.0.2 or later client and admin set is required for Kerberos authentication.
- Mac OS X Server 10.0 or later
- Clients computers must have MIT Kerberos for Macintosh 3.0 or later installed and set up. Kerberos for Macintosh 3.0 and later requires at least Mac OS 8.1 and a PowerPC-based Macintosh computer. Kerberos for Macintosh may be downloaded from MIT (http://web.mit.edu/macdev/www/kerberos.html).

Server Set Up

Figure 1: The Global Security Tab

To enable Kerberos authentication on Macintosh Manager 2:

1. Open the Macintosh Manager application and connect to a Macintosh Management server.
2. Click the Global tab.
3. Click the "Clients must authenticate using Kerberos" checkbox. With this feature enabled, only clients with a valid Kerberos for Macintosh installation will be able to log in, and a valid Kerberos name and password will be required of users. Client workstations lacking a Kerberos for Macintosh installation will be unable to log in.

Note: The Macintosh Manager administration application may be run from any Mac OS 9 or Mac OS X client and will continue to use directory passwords.

Macintosh Manager 2.0.2 accepts only a directory password for administrators using this feature.

Client Set Up

Figure 2: Kerberos for Macintosh Realm Configuration Dialog

To prepare a client computer, you must set up the Kerberos for Macintosh realm list. To do this, create a Kerberos Preferences file in your Preferences folder containing a list of realms valid for your site. See the MIT Kerberos for Macintosh documentation for details:
http://web.mit.edu/macdev/Development/MITKerberos/Common/Documentation/preferences.html

After defining realms in the Kerberos Preferences file, add any desired realm(s) to the "Favorite Realms" column. Drag the realm containing the users for the client's Macintosh Manager server to the top of the Favorite Realms list, defining it as the default realm. Only the default realm can be used for login authentication with Macintosh Manager.

With Kerberos enabled, all Macintosh Manager client computers and users must have access to a Kerberos Preferences file in a location accessible to Kerberos for Macintosh. Since each user has a unique Preferences folder, drag the Kerberos Preferences file created above to the Application Support folder of each client computer's system folder, sharing the file across all user accounts.

Logging In

In order to be able to log in to a Macintosh Manager client set up to use Kerberos, each user's account must have a short name set in the Server Admin Users & Groups module that exactly matches his Kerberos name. For example, a user named "Ludovic Decker" with a Kerberos principal "luddeker@APPLE.COM" must have his short name set to "luddecker" in Server Admin. When logging in to the Macintosh Manager client, users may enter either their full name or short name. Kerberos tickets will still be obtained for the correct principal.

Since a user's Kerberos password does not necessarily match the user's directory password, Macintosh Manager may not be able to connect to a user's home directory automatically in the event of a password mismatch. Should this occur, the client will prompt for the user's directory password in an AppleShare connection dialog. A seamless login can be ensured by having users keep their Kerberos and directory passwords in sync, by specifying no home directories for users, or by using the All Other Users feature. User and home directory information can be stored in any source readable by Directory Services, including LDAP.

The All Other Users feature in Macintosh Manager 2 is a useful means of dealing with large Kerberos userbases. With All Other Users enabled, all Kerberos users need not be present in a Directory Services data source or imported into Macintosh Manager to be able to use Macintosh Manager clients. In list login view, users should select the All Other Users account. In "Users type their name" login mode, users should enter their Kerberos name. If users have been imported into Macintosh Manager or are present in a Directory Services data source, they will receive their account and home directory data. If the user is not present in any data source with All Other Users enabled, a local home directory will be created.

Mac OS X: Applications Appear as Folders in the Dock, Cannot Be Opened

Under certain conditions in Mac OS X versions 10.0 to 10.0.4, the applications in the Dock appear with folder icons and cannot be opened.
This article has been archived and is no longer updated by Apple.

Symptom

Applications cannot be opened from the Dock. Folders may appear in the Dock where application icons are expected.

This may occur if the Users folder (/Users) has been moved or deleted.

Note: When the Users folder is moved or deleted, the Setup Assistant is bypassed and the user automatically logs in.

Important: You should not relocate the Users folder.

Solution

Follow these steps:

Warning: These steps recursively eliminate all contents of the affected Home directory. However, it is very likely that the affected Home directory is not your original Home directory, which may have already been relocated or deleted (causing this issue).

1. Choose Log Out from the Apple menu. The Login panel appears.
2. In the user name field, type: `>console`
3. Do not type a password and click Log In. The command-line console appears, and you are prompted to log in.
4. Log in with your normal name and password. If you do not know the password, see technical document 106156: "**Mac OS X 10.0: How to Change a User's Password**"
5. Type: `cd /Users`
6. Press Return.
7. Type: `ls`
8. Press Return, and verify the exact name of your Home directory from the list that appears. This is normally the same as your short user name, but it can be different if you have undertaken a series of deliberate steps to change it.
9. Type: `sudo rm -R home`
Note: Replace "`home`" with the actual name of your Home directory.
10. Press Return. Type your password when prompted and Press Return.

You have eliminated the Home directory with incorrect permissions. To create a new Home directory with the correct permissions, follow these steps:

1. Type: `sudo mkdir /Users/home`
Note: Replace "`home`" with the actual name of your Home directory, the same as the one you just removed. Changing this name would require other steps that are beyond the scope of this document.
2. Press Return.
3. Type: `sudo chown shortname:staff home`
Note: Replace "`shortname`" with the same short user name you have been using. Replace "home" with the name of the Home directory you have been using. These are normally the same. Example: A user named Zoe Brown with a short name of "zbrown" would type:
`sudo chown zbrown:staff zbrown`
4. Press Return. If prompted, type your password and press Return again.
5. Type `exit` and Press Return.

You should now be able to log in normally, and you will have a new Home directory.

Mac OS X Server 10.0: About the FTP root

Mac OS X Server roots FTP service in /Library/FTPServer/FTPRoot.
This article has been archived and is no longer updated by Apple.
When users connect to Mac OS X Server via FTP, they will be 'rooted' in the directory /Library/FTPServer/FTPRoot.

This means that they will not be able to navigate the file system above that directory. When you create share points with the Server Admin application, a symbolic link to that share point is created in this directory. FTP uses symbolic links, since FTP clients cannot follow aliases. If you do not want FTP clients to have access to certain share points, remove the symbolic links from this directory. If you wish to share something via FTP that you do not want to share via other services, you can create a symbolic link using the 'ln' command in Terminal. For more information on this command, open the Terminal application and type: `man ln`

When a user whose Home directory is shared connects via FTP, he will start the session his Home. Otherwise, the user starts his session at the FTP root.

For related information, please see technical document 31099: "**Mac OS X Server: /etc/ftpchroot File Is Ignored**"
Published Date: Feb 17, 2012

Macintosh Manager: How to Set up Internet Explorer for Reduced Network Traffic

Follow the steps in this document to eliminate excess network traffic created when Microsoft Internet Explorer accesses the cache.waf file.
This article has been archived and is no longer updated by Apple.
This article applies to Macintosh Manager versions 1.4.1 and 2.0 to 2.2.

Follow these steps to allow client computers to access the cache.waf locally, rather than across the network:

1. In the Macintosh Manager admin application, click on the "Computers" tab and then the "Control" tab below it.
2. Select the option to "Force computer hard disk name to:" and type "Macintosh HD"
3. At the Macintosh Manager admin workstation, set up Explorer as you like it.
4. While in Internet Explorer, choose Preferences from the Edit menu.
5. Click the Advanced category in the Web Browser portion of the preferences list.
6. Click Empty Now in the Cache section of the preference panel.
7. Click Change Location.
8. Select the location Macintosh HD: System Folder as the cache location.
9. Set the cache size according to your preference.
10. Click OK.
11. Open the Macintosh Manager admin application.
12. Click your desktop.
13. Choose Hide Others from the Application menu.
14. Open the Macintosh Manager folder (the shared volume that has appeared on your desktop).
Note: If the user documents are stored on a different volume, connect to that volume.
15. Locate the Managed Preferences folder on the document storage volume. Also locate the Forced Preferences and Initial Preferences folders inside it.
16. Still at the admin workstation, drag the Internet Preferences file (System Folder: Preferences: Internet Preferences) and the Explorer folder (System Folder: Preferences: Explorer) into the Forced Preferences folder.
17. Using Network Assistant, locate all of the cache.waf files on the document volume(s), then delete them.

After you have completed these steps, the Internet Preferences file and the Explorer folder will be copied to an individual user's preferences folder (on the server) at time of login. If using Mac OS 8.6 or earlier workstations, these items will also be copied down to the local hard disk.

Tips

- If at a later time you want to let users regain their own Internet and Explorer settings, move the Explorer folder from the Forced Preferences folder to the Initial Preferences folder. If you want users to get predefined Internet prefs at first login, this file must go into the Forced Prefs folder. The reason is that the system creates the Internet Preferences file before the preference management begins following login, meaning that the preference management process would not overwrite a pre-existing file with an item from the Initial Preferences folder.
- Make sure you can connect to the documents volume (even if it is the default Macintosh Manager volume), and that you have read-write access to the Managed Preferences folder.
- In the workgroup settings, make sure you have "Copy preferences" selected in the Options panel for the workgroup. Also select the "Copy Internet Preferences or admin-defined" in the Global panel.
- Using the Labels command in the File menu, color code the Internet Preferences file and at least one item inside the Explorer folder at the server. Then log in as a user. After a successful test of your new settings, you should see the color coded items appear in the individual user's folder (the local Preferences folder on Mac OS 8.6 or earlier computers).
- Clients with differing startup disk names may not work properly. You should use the same startup disk name on all clients. By default, the startup disk is named Macintosh HD.

Published Date: Feb 17, 2012

Mac OS X: How to Replace the Alias "Desktop (Mac OS 9)"

If the alias "Desktop (Mac OS 9)" is deleted when Mac OS 9 and Mac OS X are installed on the same disk, the alias cannot be recreated in the Finder. Use the method described here.
This article has been archived and is no longer updated by Apple.

Symptom

1. You cannot recreate the "Desktop (Mac OS 9)" alias after deletion.
2. You cannot access the Mac OS 9 Desktop Folder.

Solution

This issue is resolved in Mac OS X 10.2 or later, as described below. For versions 10.0 to 10.1.5, follow these steps to recreate the alias:

1. Open the Terminal application (located at /Applications/Utilities/).
2. Type: `ln -s /"Desktop Folder" ~/Desktop/"Desktop (Mac OS 9)"`
3. Press Return.
4. Click on the desktop.

You should see the "Desktop (Mac OS 9)" alias on the desktop.

To avoid the need to use this alias, you should move any items from your Mac OS 9 desktop either to your Mac OS X Documents folder, or to a more appropriate folder on the Mac OS 9 disk. Locations within your Mac OS X Home directory provide you with organization and enhanced privacy when in a multi-user environment.

Background information

When you install Mac OS X v 10.0 to 10.1.5, it creates a symbolic link on the Mac OS X desktop named "Desktop (Mac OS 9)." This symbolic link is functionally similar to an alias, providing access to the Mac OS 9 Desktop Folder. If Mac OS 9 is installed on the same disk or disk partition as Mac OS X, this link is the only way to access the Mac OS 9 Desktop Folder. If the link is deleted in this scenario, you can only recreate it by using the Terminal application.

In Mac OS X 10.2, a symbolic link to the Mac OS 9 Desktop Folder called "Desktop (Mac OS 9)" is automatically created at startup if there are items on the Mac OS 9 Desktop. If there are no items on the Mac OS 9 Desktop, then the link is automatically removed the next time the computer restarts. This symbolic link is created at the root of the Mac OS X volume, and its permissions are set so that it cannot be deleted in normal use. If it is deleted, it will be recreated after the next restart.
Published Date: Feb 17, 2012

Mac OS X 10.1: Question Mark Appears in Dock

A question mark may appear in the Dock where an application formerly appeared. This affects Microsoft Internet Explorer when upgrading to Mac OS X 10.1.
This article has been archived and is no longer updated by Apple.

Symptom

The Dock may have one or more question mark (?) icons.

Solution

This occurs whenever an item in your Dock cannot be found. An item may not be found when:

- An installer replaces an application with a different version in a new location.
- You remove the item from your computer.
- The item in the Dock was stored on a disk that is no longer present or available (mounted). This includes items dragged to the Dock from a previously-mounted disk image.
- If the Applications folder is renamed or moved when started up from Mac OS 9. You should not rename or relocate Mac OS X-installed folders.

For example, the Mac OS X Installer replaces Internet Explorer with a new and improved version. If you had Internet Explorer in the Dock, you would follow these steps to delete the question mark and replace it with an icon of Internet Explorer:

1. Drag the question mark from the Dock to the desktop. It disappears.
2. Click the Finder icon in the Dock.
3. Choose Applications from the Go menu.
4. Drag the Internet Explorer icon to the Dock.

Published Date: Feb 17, 2012

Mac OS X 10.1: DVD Player 3.0 Installed on Compatible Computers

DVD Player 3.0 requires an Apple computer originally equipped with a built-in DVD-ROM drive and AGP graphics. Other computers can start up from Mac OS 9 (included) to view DVD-Video discs.
This article has been archived and is no longer updated by Apple.

Symptom

1. DVD Player 3.0 is not installed by the Mac OS X 10.1 Installer.
2. DVD Player 3.0 does not open if copied to the computer from another.

Solution

Watching DVD-Video discs in Mac OS X 10.1

DVD Player 3.0 requires an Apple computer originally equipped with a built-in DVD-ROM drive and AGP graphics. It is installed and will open on computers that meet this requirement.

The following computers may meet the DVD Player requirements:

- iBook - see Notes 1 and 4
- iMac - see Notes 1 and 4
- PowerBook (FireWire)
- PowerBook G4
- Power Mac G4 Cube - see Notes 2 and 4
- Power Mac G4 - see Notes 3 and 4

Notes

1. Models equipped with DVD-ROM drives also include AGP graphics.
Not all computers in this category include DVD-ROM drives.
2. Some models do not include DVD-ROM drives.
3. This refers to all except the Power Mac G4 (PCI Graphics) model.
Some computers in this category do not include DVD-ROM drives.
4. You can open the Apple System Profiler and click the Devices and Volumes tab to see if the computer has a DVD-ROM drive or AGP graphics.

Watching DVD discs in Mac OS 9

Other computers with DVD-ROM drives have hardware decoders, which DVD Player 3.0 does not work with. To play a DVD-Video disc on these computers, restart the computer using Mac OS 9. Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Click Startup Disk.
3. Select your Mac OS 9 System Folder.
4. Close System Preferences.
5. Choose Restart from the Apple menu.
6. Insert the DVD.
7. Open Apple DVD Player.

After watching the movie, use the Startup Disk control panel in Mac OS 9 to select your Mac OS X System Folder, then restart the computer.

Also see technical document 60975 "**DVD Player 3.0.1: Compatible Computers**."

Mac OS X 10.1: FireWire Drives Do Not Become Available When Connected

Third-party FireWire drives with earlier firmware may not appear on the desktop or otherwise become available (mount) in Mac OS X 10.1.
This article has been archived and is no longer updated by Apple.

Symptom

Third-party FireWire drives do not appear on the desktop or otherwise become available when you connect them to the computer.

Solution

Download and install the Mac OS X 10.1.1 Update. You can do this using the Software Update feature of System Preferences.

For Mac OS X 10.1, check the drive vendor's Web site to make sure the FireWire drive's firmware is up to date.
Published Date: Feb 17, 2012

Don‘t start up from an external USB device

If you select a USB startup disk from System Preferences, in some cases the computer may not start up from the USB disk.

This article has been archived and is no longer updated by Apple.

This is expected behavior.

Under Mac OS X, Apple does not support starting up from USB devices. Although some configurations may allow a USB volume to be selected as a startup volume via the Startup Manager, this may not work for all configurations, and Apple is unable to provide assistance in troubleshooting such configurations.

Mac OS X 10.1: iSub Speaker Does Not Respond to Volume Control When Connected to an iBook

Disconnect the iSub speaker from the computer and reconnect it if it does not work properly when connected to an iBook started up from Mac OS X 10.1.

This article has been archived and is no longer updated by Apple.

Symptom

The speakers do not respond to volume control. The sound may be distorted.

Note: iBook (Dual USB) is unaffected.

Solution

After the computer starts up from Mac OS X 10.1, disconnect the iSub speaker from the computer and reconnect it.

Mac OS X 10.1: How to Set up LDAP Address Services for Mail

You can set up the Mail application to find names and email addresses from your institution's LDAP server.

This article has been archived and is no longer updated by Apple.

Many institutions store address information on LDAP (Lightweight Directory Access Protocol) servers. You can set up the Mail application included with Mac OS X to use these servers to find email addresses when names are typed in the various address fields (To, Cc, and Bcc).

This document assumes you have already set up a POP or IMAP email account.

Follow these steps:

1. Open the application Mail (from the Dock or Applications folder).
2. Choose Preferences from the Mail menu.
3. Click Composing in the toolbar.
4. Be sure that the checkbox is selected for "Lookup addresses in network directories."
5. Click Edit Server List.
6. Click Add Server.
7. Double-click the empty field in the "Host name" column, then type the DNS name of the LDAP host.
Note: It might look like: exampleldap.apple.com. Check with your Internet service provider or network administrator to get the address of your LDAP server. There are also a number of public LDAP servers. To find one, use Sherlock to search the Internet for "public ldap servers".
8. Press Return.
9. Double-click the empty field in the Search Base column. Type the information that is correct for your host.
Note: Check with your network administrator or Internet service provider. The information might look like: ou=People, o=Company Name
10. Press Return.
11. Click Close.
12. Close the Mail Preferences window.

When you type a name or email address, "Searching..." should appear in the field as you type. If the server only finds one name, it will fill in the field automatically. If the server finds multiple names, Mail first suggests one you use frequently, and a second or two later a list of other matches will appear.

Mac OS X: Pressing Command-Option-Shift-Power Does Not Shut Down the Computer

Pressing Command-Option-Shift-Power does not shut down the computer when using Mac OS X.
This article has been archived and is no longer updated by Apple.

Symptom

Pressing Command-Option-Shift-Power does not shut down the computer.

Solution

This Mac OS 9 feature is not implemented in Mac OS X, because Apple Pro Keyboards no longer have Power buttons. To restart or shut down the computer, you may:

- Choose Shut Down from the Apple menu.
- Press the reset button to restart the computer.
- Press and hold the power button on the computer for 6 seconds to shut down the computer.

The latter technique does not work on some earlier Mac OS X-compatible computers. On these computers, you may shut down the computer by pressing the reset button immediately followed by the power button.

Mac OS X 10.1: DVD Player Not Installed on PowerBook (FireWire) Computer

DVD Player 3.0 is not installed on PowerBook (FireWire) computers unless a DVD-ROM drive is in the media bay when you install Mac OS X 10.1.

This article has been archived and is no longer updated by Apple.

Symptom

The DVD Player application is not installed.

Solution

Make sure the DVD-ROM drive is installed in the PowerBook (FireWire) computer's media bay before opening the Mac OS X 10.1 Installer.

If you have not done this, reinstall Mac OS X 10.1 while the DVD-ROM is in the media bay.

Mac OS X 10.1: iBook Mute Button Does Not Respond

When using some iBook models with Mac OS X 10.1, the mute button may not respond after the sound is muted. This leaves the sound muted.
This article has been archived and is no longer updated by Apple.

Symptom

After muting sound in Mac OS X 10.1, pressing the mute key does not turn sound back on. The sound remains muted.

Note: iBook (Dual USB) is unaffected.

Solution

Adjust the volume from the volume icon in the menu bar or from the Sound pane of the System Preferences application.
Published Date: Feb 17, 2012

Mac OS X 10.1: iBook or iMac Sound Out of Phase, Left and Right Channels Sound Reversed

Audio may be out of phase when on certain iBook and iMac computers with Mac OS X 10.1. The left and right channels may sound reversed.
This article has been archived and is no longer updated by Apple.

Symptom

iBook

When using the analog sound output port with headphones or external speakers, the audio is out of phase. This can have the effect of distorting or removing certain elements of the audio. For example, bass frequencies may be reduced or other instruments may appear to be "missing."

iMac

When listening to the built-in speakers, the audio is out of phase. This can have the effect of distorting or removing certain elements of the audio. For example, bass frequencies may be reduced or other instruments may appear to be "missing."

The parenthetical product descriptions (Summer 2000) and (Summer 2001) refer to the summer of the Northern Hemisphere.

Note: iBook (Dual USB) is unaffected.

Solution

Update to Mac OS X 10.1.2 or later. Use the Software Update pane of System Preferences, or download the update from Apple Software Downloads (http://www.apple.com/swupdates/).

Mac OS X and Mac OS X Server: Compatible network media

This article has been archived and is no longer updated by Apple.

Mac OS X and Mac OS X Server work with the types of network media described in this document.

Network Access Methods

Mac OS X and Mac OS X Server are designed to work with:

- Ethernet (twisted pair and fiber optic)
- wireless Ethernet (AirPort)

Mac OS X and Mac OS X Server are not designed to work with:

- LocalTalk
- Token Ring

Ethernet networking

Mac OS X provides Ethernet network access when used with the network adapters and transmission media listed below. You should see third-party support materials for information regarding non-Apple network adapters.

Twisted pair Ethernet:

- Built-in Ethernet ports on all Mac OS X 10.1 compatible computers.
- Apple 10/100Base-T Ethernet PCI Card
- Apple 4-Port 10/100 Ethernet PCI Card

These adapters work with the following transmission media:

10Base-T Ethernet twisted pair (Cat 3)
10/100Base-T Ethernet twisted pair (Cat 5)
10/100/1000Base-T Ethernet twisted pair (Cat 5+, Cat 5e, or Cat 6)

Optical Ethernet:

- Apple Gigabit Ethernet PCI Card

This card works with a 1000Base-SX Ethernet fiber optic network. It uses multimode fiber-optic cabling with an SC style connector.

Wireless Ethernet networking

Mac OS X provides 802.11b (AirPort) and 802.11g (AirPort Extreme) networking in the 2.4 GHz band at 11 Mbit/s and 54 Mbits/s, respectively, Direct Sequence Spread Spectrum (DSSS). Apple provides technical support for Apple-branded AirPort products. See third-party support materials for information on compatible third-party wireless products.

Physical data rate based on IEEE 802.11g specification. Actual data throughput will be lower. Range will vary with site conditions. Assumes AirPort Express/Extreme network with 802.11g-enabled computer. Speed and range will be less if an 802.11b product joins the network. Accessing the wireless network requires an AirPort- or AirPort Extreme-enabled computer or other Wi-Fi Certified 802.11a/b/g-enabled computer.

Published Date: Feb 19, 2012

Mac OS X 10.1: Viewing and Typing Text in Different Languages

Mac OS X includes several languages you can select for menus and dialogs. You can also view and type text in these languages. In addition to these languages, you can read and write text in other languages.
This article has been archived and is no longer updated by Apple.

Notes

1. Use of some languages requires installation of additional software, such as a Mac OS 9 language kit or font. For example, Mac OS X 10.1 includes script bundles for Cyrillic and Central European languages. However, such a script bundle does not activate unless at least one font for that script is present. Installing a font that is compatible with the script bundle will activate it. Keyboard layouts associated with the activated bundle then appear in the International Preferences panel. Mac OS 9 language kits are included as custom installation items on the Mac OS 9 Installation CD. References in this document to "language kits" refer to these.

2. Some applications display text in these languages automatically, while others require that you select the text and use a special font for the language.

3. Many languages are included with Mac OS X 10.1. Support for additional languages can be downloaded. See technical document 106700, "**Mac OS X 10.1: Language Updates for Mac OS X**".

4. Unicode allows you to use certain languages in applications such as Mail, TextEdit, or the Finder.

5. To type text in a given language, you may need to select a keyboard or input method for it in the International panel of System Preferences. After selecting additional keyboards or input methods, a new menu with a flag icon will appear in the menu bar of all applications. This is the keyboard menu, and it allows you to choose among different keyboards or input methods. Some input methods may create an additional menu next to the keyboard menu when they are active. Keyboards listed as "Unicode" in International Preferences are only available in Unicode applications such as Mail, TextEdit, or the Finder. When typing in an application, the availability of these keyboards in the keyboard menu indicates whether or not that application works with Unicode.

The following sections explain how to view or type text in various languages:

Japanese

1. Open the document in a Mac OS X application.
2. If necessary, use these fonts: Osaka, Osaka-mono, or Hiragino
3. To type text: Select the Kotoeri input method

Simplified Chinese

1. Open the document in a Mac OS X application.
2. If necessary, use this font: Hei
3. To type text: Install the Simplified Chinese Language Update, if needed, and select Simplified Chinese input method.

Traditional Chinese

1. Open the document in a Mac OS X application.
2. If necessary, use this font: Apple LiGothic.
3. To type text: Install the Traditional Chinese Language Update, if needed, and select Traditional Chinese input method.

Korean

1. Open the document in a Mac OS X application.
2. If necessary, use this font: Apple Gothic
3. To type text: Install the Korean Language Update, if needed, and select Korean input method.

Central European Languages (Czech, Hungarian, Polish, Slovak)

1. Install the Central European Language kit in Mac OS 9.
2. To read in Unicode applications, use these fonts when necessary: Lucida Grande, Geneva, Times, Helvetica, Courier, or Monaco. Many other fonts work with these languages as well.

3. To write in Unicode applications: Select and use the Extended Roman Unicode keyboard.
4. To read in any application, use these fonts when necessary: Times CE, Helvetica CE, Charcoal CE, Geneva CE, Palatino CE, Courier CE, Chicago CE, Monaco CE.
5. To write in any application, select and then use any of the following keyboards: Czech, Hungarian, Polish, Slovak

Cyrillic (Bulgarian, Russian, Ukrainian)

1. Install the Cyrillic Language Kit in Mac OS 9.
2. To read in Unicode applications use the Lucida Grande font when necessary.
3. To read in any application, use these fonts when necessary: Charcoal CY, Geneva CY, Helvetica CY, Monaco CY, Times CY
4. To write in any application, select and use any of the following keyboards: Bulgarian, Russian, Ukrainian

Note: You cannot type Cyrillic with the Extended Roman keyboard.

Vietnamese

You must use a Unicode application.

1. To read: If necessary, use the Lucida Grande font.
2. To write: Select and use the Vietnamese keyboard.

Icelandic or Turkish

You must use a Unicode application.

1. To read: if necessary, use these fonts: Lucida Grande, Times, Helvetica, Geneva, Monaco, or Courier. Many other Roman fonts support these languages as well.
2. To write: enable and use the Extended Roman keyboard.

Mac OS X Server 10.0, 10.1: How to Enable PHP

This article explains how to enable PHP on Mac OS X Server versions 10.0.3 to 10.1.4.
This article has been archived and is no longer updated by Apple.

Important, before you begin

1. You will edit the "httpd.conf" file to enable PHP service for Apache. Follow these steps carefully, and be sure not to change the file in any other way than specifically described.

2. If Apache does not work as expected or fails to start after you have modified the file, you can delete it and replace it with a duplicate of the "httpd.conf.default" file. After making a duplicate of the default, change its name to "httpd.conf" (to match the one you are replacing). Be sure never to modify the original "httpd.conf.default" file.

3. A pound sign (#) in the front of a line indicates that the line will not be read by Apache when starting. Removing pound signs, as described, will cause Apache to read the configuration from that line.

4. Beyond the Knowledge Base, Apple does not offer technical support for configuring or using PHP. See www.php.net for more PHP information.

How to enable PHP

Follow these steps at the server:

1. Choose Log Out from the Apple menu.
2. Log in as the root user. If you need help with this step, see "Mac OS X: About the root User and How to Enable It".
3. Open TextEdit.
4. Choose Open from the File menu.
5. In the Go To field, type: /etc/httpd/
6. Locate and open the file named "httpd.conf".
7. In this file, find the line that reads:

#LoadModule php_module modules/mod_php.so

8. Remove the pound sign (#) from the start of this line. Do not modify the line in any other way.
9. Scroll down until you find the line that reads:

#AddModule mod_php.c

10. Remove the pound sign (#) from the start of this line. Do not modify the line in any other way.
11. Scroll down until you find the lines that read:

#AddType application/x-httpd-php .php
#AddType application/x-httpd-php-source .phps

12. Remove the pound signs (#) from these lines. Do not modify the lines in any other way.
13. Choose Save from the File menu.
14. Quit TextEdit.
15. Choose Log Out from the Apple menu.
16. Log in as an Admin user.
17. Open Server Admin and log in.
18. Stop and restart the Web Server.

You can verify that PHP is working correctly by connecting to the server and loading the "info.php" page (http://<insertdomain>/info.php). If you have changed the document root or moved this file you, may not be able to do this.

Published Date: Feb 17, 2012

Mac OS X Server 10.0 and later: About the IMAP Admin Access Port

This document explains the purpose of the IMAP Admin Access Port in Mac OS X Server 10.0 and later, and how to use it.
This article has been archived and is no longer updated by Apple.
The IMAP options in Server Admin let you select "Allow IMAP Administrator Access," with a default TCP port of 626. Mail administrators can remotely access the server at this port, view outgoing mail waiting to be delivered to other SMTP hosts, and view mail in users' mailboxes.

Warning: Care should be taken to restrict this access to trusted administrators. The messages can be read, forwarded, and deleted. This is a very powerful feature that is useful in troubleshooting and mail server management.

How to enable Access

1. Open Server Admin and log in.
2. Click the Internet tab.
3. Choose Configure Mail Service from the Mail Service menu.
4. Click the Protocols tab.
5. Click IMAP Options.
6. Be sure that the checkbox for Allow IMAP Administrator Access is selected.

Preparing the administrator user

In your Users & Groups list, be sure you have at least one user set up for this purpose. The user must have have three characteristics:

- privileges to log in to the server
- must be an Admin user (select "User can administer the server")
- must have mail enabled (IMAP)

Connecting to the IMAP Admin Access Port

1. You must have an IMAP mail client that works with nested folders and allows you to change the default port for IMAP connections (for example, Microsoft Outlook Express).
2. In the IMAP client, set up a user account that corresponds to the user created at the server. Enter the information for your server as you would for any account, but change the port to 626 (in Outlook Express, this option is under the Advanced section when setting account preferences).
3. Log in from the IMAP client.

Mac OS X 10.1: Many Third-Party Ink Jet Printer Drivers Are Included

Mac OS X 10.1 includes preinstalled drivers for many popular third-party ink jet (raster) printers.
This article has been archived and is no longer updated by Apple.
The installation of Mac OS X 10.1 includes drivers written by Canon, Epson, and Hewlett-Packard for certain models of their respective printers. If you own one of the printers listed below, simply connect it to your Macintosh -- and Mac OS X automatically sets up Print Center to use the printer. For information on PostScript and Apple LaserWriter printers, see technical document 106516: "**Mac OS X 10.1: Includes PPDs for Many PostScript Printers**"

This list reflects the Mac OS X 10.1 release. Updates available via the Software Update feature of the System Preferences application include drivers for more printers.

Printer drivers included:

Canon

- BJF210
- BJF360
- BJF660
- BJF850
- BJF870
- BJC85
- BJC2100
- BJC8200
- BJM70
- BJS6300
- BJS600
- BJS630
- S400
- S450
- S600
- S630
- S800
- S6300

Epson

- Stylus COLOR 680
- Stylus COLOR 740
- Stylus COLOR 760
- Stylus COLOR 777
- Stylus COLOR 860
- Stylus COLOR 880
- PM-720C
- PM-780C
- PM-780CS
- PM-880C
- PM-900C
- PM-920C
- PM-3500C

Hewlett-Packard

- Deskjet 810C
- Deskjet 812C
- Deskjet 815C
- Deskjet 816C (German SKU)
- Deskjet 830C
- Deskjet 832C
- Deskjet 840C
- Deskjet 842C

- Deskjet 880C
- Deskjet 882C
- Deskjet 895Cse
- Deskjet 895Cxi
- Deskjet 930C
- Deskjet 932C
- Deskjet 935C
- Deskjet 950C
- Deskjet 952C
- Deskjet 955C (Japan SKU)
- Deskjet 957C (Japan SKU)
- Deskjet 960Cxi
- Deskjet 960Cse
- Deskjet 970Cse
- Deskjet 970Cxi
- Deskjet 980Cse
- Deskjet 980Cxi
- Deskjet 990Cse
- Deskjet 990Cxi
- Deskjet 990Cm series

This list covers just the drivers that are included with Mac OS X 10.1. Note that these three vendors and others, such as Lexmark, have released raster drivers for Mac OS X. If your printer is not listed here, check with your printer's manufacturer to determine availability of drivers for use with Mac OS X.

Notes

1. Some printing features are not included in Mac OS X 10.1, such as custom paper sizes, banner printing, booklet printing, and watermarks.
2. Some of the listed printers may include built-in or add-on network adapters. The drivers included with Mac OS X 10.1 only work with these printers when they are directly connected to the computer's USB port. These drivers do not have a network connection feature for any of these printers.

Mac OS X 10.1: AirPort Control Strip, Dock Extra Replaced By Menu Bar Item

The AirPort menu bar item in Mac OS X 10.1 replaces the AirPort portion of the Control Strip in Mac OS 9 and the AirPort Dock Extra of Mac OS X 10.0.
This article has been archived and is no longer updated by Apple.
The AirPort menu bar item in Mac OS X 10.1 replaces the AirPort portion of the Control Strip in Mac OS 9 and the AirPort Dock Extra of Mac OS X 10.0. The AirPort menu bar item appears on the right side of the menu bar.

Figure 1 The AirPort, Sound, and Battery menu bar items

You can use the Airport menu bar item to:

- Change AirPort networks
- Turn the AirPort Card on or off
- Open Internet Connect
- Create a network (Computer-to-Computer)

There are four signal bars on the AirPort status icon in the menu bar. The more bars that are black, the higher the signal quality.

Figure 2 Signal bars

Activating the menu bar item

You can show or hide the AirPort menu bar item using either of these methods:

System Preferences method

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. Choose AirPort from the Show pop-up menu.
4. Click the AirPort tab.
5. Click to select or deselect the "Show AirPort status in menu bar" checkbox.

Internet Connect method

This works when you are already connected to a LAN via AirPort.

1. Open Internet Connect.
2. Click to select or deselect the "Show AirPort status in menu bar" checkbox.

Menu bar items can be repositioned by holding down the Command key while dragging the icon to its new position. You can also remove the icon by pressing Command while dragging the item out of the menu bar.
Published Date: Feb 20, 2012

Mac OS X 10.1: You Must Select USB Speakers in System Preferences

After plugging a pair of USB speakers into a Macintosh using Mac OS X, you must select the speakers to hear sound from them.
This article has been archived and is no longer updated by Apple.

Symptom

No sound comes from USB speakers immediately after plugging them in.

This behavior differs from Mac OS 9, in which sound is automatically rerouted.

Solution

To route sound to the USB speakers:

1. Choose System Preferences from the Apple menu.
2. Click Sound .
3. Click the Output tab.
4. Select the USB Speakers from the device list.

Published Date: Feb 17, 2012

Mac OS X 10.1: Difficulty Selecting Country or Time Zone

In the Date & Time pane, you may not be able to select a country within a time zone. Time zones are off by plus 1 hour on the map.
This article has been archived and is no longer updated by Apple.

Symptom

In the Time Zone section of the Date & Time pane of System Preferences, you cannot select a country within a time zone. The time zones on the map are off by plus 1 hour on the world map.

Note: This applies only when you update to Mac OS X version 10.1 from versions 10.0 to 10.0.4.

Solution

Update to Mac OS X 10.1.2 or later. For more information, see technical document 106704, "**Mac OS X: How to Update Your Software**".
Published Date: Feb 17, 2012

Mac OS X Server: Firmware Update Not on CD-ROM

You may encounter an instruction to "run the Firmware Updater located on this CD." This updater is not on the CD-ROM disc. You must download it.
This article has been archived and is no longer updated by Apple.

Symptom

When using the Mac OS X Server Installer on a computer that requires a firmware update, the Installer instructs you to "run the Firmware Updater located on this CD." There is no Firmware update on the disc.

Figure 1 Firmware update alert box

Solution

The Firmware Updater can be downloaded from:

- Technical document 75130: **iMac Firmware Update 4.1.9**
- Technical document 75131: **Power Mac G4 Firmware Update 4.1.8**
- Technical document 75129: **Power Mac G4 Cube Firmare Update 4.1.9**

For earlier computers, go to Apple Software Downloads (http://www.apple.com/swupdates/) and search using the terms "firmware" and the name of your computer.

For related information, see technical document 106506: "**Mac OS X: Start Up from Mac OS 9 to Install Open Firmware Updates**"
Published Date: Feb 17, 2012

Mac OS X 10.1: Binding Local NetInfo Database to an NIS Domain

Network Information System (NIS) is similar to NetInfo in that it allows multiple computers to share administrative data that is stored on one computer. However, NIS uses standard UNIX flat files for this administrative data, while NetInfo uses a distributed database. Setting up Mac OS X to be an NIS client should not affect NetInfo.
This article has been archived and is no longer updated by Apple.
This article assumes knowledge of NetInfo and its structure. For more information on NetInfo, see technical document 60038: "**Mac OS X Server: What Is NetInfo?**" This document also contains instructions on backing up the database, which should be done before continuing.

For Mac OS X to bind to an NIS domain, the /etc/hostconfig file must be changed, and lookupd must be configured to use NIS. The easiest way to accomplish this task is to log in as root. Alternatively, the steps below can be performed in the Terminal by an Admin user (a member of the admin group). The file system may not be in a state capable of restarting the computer if this procedure is not followed correctly. Therefore you should make backup copies of the /etc/hostconfig file and /var/db/netinfo/local.nidb.

Edit the hostconfig file

Open the /etc/hostconfig file with TextEdit or a command line text editor. From the Terminal, the file can be opened in TextEdit with the command "open -e /etc/hostconfig".

Find the "NISDOMAIN" entry. This is set to "-NO-" by default. Remove "-NO-" and type in the NIS domain name that the computer will bind to, ie NISDOMAIN=my.domain. This information can be obtained from the NIS administrator. Next, the line that contains RPCSERVER=-AUTOMATIC- must be change to RPCSERVER=-YES-. This will allow the portmap daemon to startup. Portmap is required for NIS to function properly.

Set up lookupd

To properly configure lookupd to use NIS, you must add directories, properties, and values to NetInfo. For a description of how these are used in NetInfo read technical document 60038: "**Mac OS X Server: What Is NetInfo?**".

First the /locations/lookupd directory must be created in NetInfo using the command:

```
nicl . -create /locations/lookupd
```

Next, this directory must be populated with the correct subdirectories, properties, and values. To create a sample lookupd.config file, copy the text from the section "Sample lookupd.config file" and save it as a text-only file named "lookupd.config". Then issue this command in the directory that contains this lookupd.config file:

```
niload -r /locations/lookupd . < lookupd.config
```

This file is only an example. It will provide an NIS client access to hosts, groups, users, and netgroups from an NIS domain. These examples can be expanded to other NIS maps, except for the auto.master map. This map type is not supported and will not work with Mac OS X.

Pictures

Here are some graphics of a completed lookupd configuration that can be used to ensure that the setup is correct. These graphics can also be used as a guide to configure lookupd if niload is not used.

Figure 1 The lookupd directory and its values and subdirectories.

Figure 2 The lookupd subdirectory groups and its values

Figure 3 The lookupd subdirectory hosts and its values

Figure 4 The lookupd subdirectory netgroups and its values

Figure 5 The lookupd subdirectory users and its values

Sample lookupd.config file

Copy below this line:

```
{
"LookupOrder" = ( "CacheAgent", "NIAgent", "YPAgent" );
"name" = ( "lookupd" );
"MaxThreads" = ( "12" );
CHILDREN = (
{
"name" = ( "groups" );
"LookupOrder" = ( "CacheAgent", "NIAgent", "YPAgent" );
},
{
"name" = ( "users" );
"LookupOrder" = ( "CacheAgent", "NIAgent", "YPAgent" );
},
{
"name" = ( "hosts" );
"LookupOrder" = ( "CacheAgent", "NIAgent", "YPAgent", "DNSAgent", "NILAgent" );
},
{
"name" = ( "netgroups" );
"LookupOrder" = ( "CacheAgent", "NIAgent", "YPAgent" );
}
)
}
```

Stop copying above this line.

Mac OS X 10.1: F12 Is Eject and Tray Opening Key

In Mac OS X 10.1 the F12 key ejects discs from optical media drives (CD-ROM, CD-RW, DVD-ROM, and combination drives). It will also open and close an empty drive tray.
This article has been archived and is no longer updated by Apple.

Symptom

Applications that would normally use the F12 key no longer recognize it. Instead, the optical drive tray opens.

The F12 key cannot be reassigned for other use.

Solution

In the initial release of Mac OS X 10.1, the F12 ejects optical media or opens and closes the tray of an empty optical drive. While this provides functionality for keyboards that do not have a dedicated Eject key, this behavior can be an issue in some situations.

When working within an application, you can bypass the eject feature by holding the Option key while you press F12. Alternatively, you may use menu items where applicable in affected applications (instead of the F12 key). Some applications allow you to remap the function keys. Check the documentation that came with your application to see if it is possible to move the F12 function to another key or key combination.

Mac OS 9.2.1 - Type 12 "Error" When Connecting Via Network Browser

A computer may stop responding, or Network Browser may unexpectedly quit with a type 12 "error" when connecting to an AppleShare (AFP) server.

This article has been archived and is no longer updated by Apple.

Symptom

- Network Browser quits with a type 12 "error" when connecting to an AppleShare (AFP) server.
- The computer stops responding, or "freezes," when you open Network Browser.

This occurs after installing Mac OS X 10.1 on the computer.

Solution

Download and install Mac OS 9.2.2 or later, which resolves the issue by installing a later version of the affected AppleShare extension.

Mac OS 9.2.2 is available either from the Software Update control panel, or from Apple Software Downloads (http://www.apple.com/swupdates/).

Published Date: Feb 20, 2012

Mac OS X 10.1: Web Sharing Does Not Start After Update from Mac OS X 10.0

Web Sharing may not start after updating to Mac OS X version 10.1 from versions 10.0 to 10.0.4.
This article has been archived and is no longer updated by Apple.

Symptom

When you attempt to start Web Sharing, the status indicates "Web Sharing Starting up...", but the Web Sharing does not start up.

You may also notice this text in your Console log:

dyld: /usr/sbin/httpd Undefined symbols:
_apple_hfs_module
/usr/sbin/apachectl start: httpd could not be started

Solution

This issue is caused by an entry in the configuration file for the Apache Web server. Editing this file allows Web Sharing to start up.

To make this change, follow these steps:

1. Open the Terminal (/Applications/Utilities/).
2. At the prompt (#), type:

```
sudo pico /etc/httpd/httpd.conf
```

3. Press Return.
4. Enter your Admin user password and press Return.
5. While pressing the Control key, press the "W" key.
6. Type: `libexec/httpd/mod_hfs_apple.so`
7. Press Return. You should now see the line:

```
LoadModule apple_hfs_module   libexec/httpd/mod_hfs_apple.so
```

8. Change the line to read:

```
LoadModule hfs_apple_module   libexec/httpd/mod_hfs_apple.so
```

9. While pressing the Control key, press the "X" key.
10. Press the "Y" key.
11. Press Return.
12. Quit the Terminal.

You should now be able open System Preferences and successfully start Web Sharing.
Published Date: Feb 17, 2012

Mac OS X: Start up From Mac OS 9 to Install Firmware Updates

You cannot install firmware updates when the computer is started up from Mac OS X 10.0 to 10.1. Start up from Mac OS 9 to update firmware.
This article has been archived and is no longer updated by Apple.
You cannot install Open Firmware updates when the computer is started up from Mac OS X versions 10.0 to 10.1. Start up from Mac OS 9 to update firmware.

Note: Mac OS 9 is included with Mac OS X and should be installed on your computer's hard disk to perform this procedure.

You can follow these steps to start up the computer from Mac OS 9, and then go back to Mac OS X:

1. Choose System Preferences from the Apple menu.
2. Click Startup Disk.
3. Choose your Mac OS 9 System Folder.
4. Close System Preferences, completing a confirmation if prompted.
5. Choose Restart from the Apple menu.
6. Follow the instructions included with the firmware update.
7. Open the Startup Disk control panel.
8. Select the Mac OS X System Folder.
9. Choose Restart from the Special menu.

Mac OS X 10.1: AirPort Software Base Station Is Not an Included Feature

AirPort Software Base Station is not a feature of AirPort in Mac OS X 10.1. You may use a Computer-to-Computer network or an AirPort Base Station.

This article has been archived and is no longer updated by Apple.

AirPort in Mac OS X 10.1 does not provide a software base station feature.

To share locally between computers, you can still easily create a computer-to-computer network by choosing Create Network from the AirPort menu bar icon. If you need Internet connection sharing or other features provided by software base station, consider purchasing an AirPort Base Station. The dedicated AirPort Base Station offers additional features not provided by the software base station feature of Mac OS 9. For more information, see the AirPort product page (http://www.apple.com/airport/).

Mac OS X: When is Starting Up From CD-ROM to Install Required?

With Mac OS X and Mac OS X Server versions 10.1 to 10.1.5, you must start up from the CD-ROM to install the operating system. Other means of installing the operating system are not recommended or supported. For versions 10.2 and later, Network Install is a secondary supported installation method, though you may need to correct a permissions issue that affects printing.
This article has been archived and is no longer updated by Apple.

Symptom

1. The server may not start up, and the file system may not be in a usable condition after an attempt to install the software when not started up from the Mac OS X Server CD-ROM.
Note: This symptom applies to versions 10.1 to 10.1.5.

2. You cannot print. Print Center quits unexpectedly.

Solution

Versions 10.1 to 10.1.5:

For symptom 1, start up from the CD-ROM to install Mac OS X Server. This is the only supported installation method.

If you have symptom 2 only, try using the Repair Privileges utility. See technical document 106900, "**Mac OS X: About the Repair Privileges Utility 1.1**".

Versions 10.2 and later:

You may install from CD-ROM or via Network Install. However, computers installed using the Network Image Utility bundled with Mac OS X Server 10.2 will have a permissions issue that prevents you from printing. Computers installed using Network Image Utility bundled with Mac OS X Server 10.2.1 or later do not have this issue. Once a computer is affected, updating it to 10.2.1 does not resolve the issue. You may, however, resolve the issue by using the Repair Permissions feature of Disk Utility. At the affected computer:

1. Open Disk Utility (/Applications/Utilities/).
2. Select the Mac OS X startup volume in the left-hand column.
3. Click the First Aid tab.
4. Click the Repair Permissions button.

Mac OS X 10.1: Apple LaserWriter 16/600 PS PhotoGrade Printer Feature Dimmed

The PhotoGrade feature of an Apple LaserWriter 16/600 PS printer cannot be enabled. Start up from Mac OS 9.2.1 to print with PhotoGrade enabled.

This article has been archived and is no longer updated by Apple.

Symptom

The PhotoGrade feature of an Apple LaserWriter 16/600 PS printer cannot be enabled. The "On" choice is dimmed in the Printer Features dialog window.

Solution

Update to Mac OS X 10.1.2 or later.

Published Date: Feb 17, 2012

Mac OS X 10.1: Stops Responding During File Transfer Between FireWire Devices

A large file transfer between two FireWire devices may cause Mac OS X to stop responding or "hang".
This article has been archived and is no longer updated by Apple.

Symptom

Mac OS X stops responding during a large FireWire-to-FireWire device file transfer (copy). This does not occur when Mac OS X is used with one FireWire data storage device at a time.

Solutions

Update to Mac OS X version 10.1.1 or later. For more information, see technical document 106634 "**Mac OS X Update 10.1.2: Enhancement and Installation Information**"

Check with the manufacturer(s) of your FireWire devices to ensure that the latest device firmware is installed.

If the issue persists, use one of the following workarounds:

- Copy smaller amounts of data at a time.
- Copy the data from one FireWire device to a non-FireWire volume, then from the non-FireWire volume to your other FireWire device.
- Start up from Mac OS 9 to perform the file copy.

Mac OS X: "A Crossed Connection Has Been Detected..." Message

An alert box may appear when connecting to the Internet with your internal Apple modem that says: "A crossed connection has been detected. Please check your modem settings and try again."
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears when connecting to the Internet with your internal Apple modem:

> "A crossed connection has been detected. Please check your modem settings and try again."

Solution

1. Choose System Preferences From the Apple menu.
2. Click Network.
3. Choose Internal Modem from the Show pop-up menu.
4. Click the Modem tab.
5. Choose Apple Internal 56K Modem (v.90) from the Modem pop-up menu.

In the event that your Internet service provider uses a v.34 connection protocol, choose Apple Internal 56K Modem (v.34) instead. Contact your ISP if you are not sure whether to use v.90 or v.34. For more information, see technical document 30734: "**V.90 Protocol: Connectivity Discussion**"
Published Date: Feb 17, 2012

Mac OS X: Start up From CD-ROM to Reformat Any Volume on Startup Device Between Mac OS (HFS) and UNIX (UFS) Disk Formats

You cannot reformat the startup volume. Additionally, you cannot reformat a nonstartup volume located on the startup device between UNIX and Mac OS (HFS and HFS Plus) formats.
This article has been archived and is no longer updated by Apple.

Symptom

When you attempt to erase a volume, Disk Utility only offers you Mac OS Standard (HFS) and Mac OS Extended (HFS Plus) file formats for certain volumes.

Normally, Disk Utility has four formats available:

- Mac OS Standard (HFS)
- Mac OS Extended (HFS Plus)
- MS-DOS File System
- UNIX File System (UFS)

Disk Utility may offer you all for formats for some volumes, while offering only HFS and HFS Plus for others.

Note: This issue only affects volumes on partitioned disks.

Solution

Start up from the Mac OS X CD-ROM to reformat the targeted volume as desired.

Disk Utility behavior explained

First, remember that a startup volume and a startup device are not the same thing. A "startup device," a hard drive for example, is a physical device that draws electricity from your computer and has moving parts. The startup device contains a disk that may be logically divided ("partitioned") into two or more "volumes" of information. At any given time, only one of these volumes contains the instance of the operating system software from which the computer is started up, thus making it the "startup volume." A volume that is contained on the startup device but that does not contain the active operating system software could be called a "nonstartup volume" on the startup device. A secondary or tertiary hard drive installed in your computer that does not contain the startup volume is a "nonstartup device" for purpose of this discussion.

Neither Disk Utility nor its predecessor Drive Setup will erase the startup volume. Disk Utility has the further restriction of not allowing you to switch a nonstartup volume that is contained on the startup device between Mac OS (HFS and HFS Plus) and UNIX file formats. If your computer has multiple hard drives installed, you should see that Disk Utility will offer all four of its available disk formats for volumes contained on nonstartup devices. This explains the symptom described above.
Published Date: Feb 17, 2012

Mac OS X 10.1: Includes PPDs for Many PostScript Printers

Mac OS X 10.1 installs PostScript Printer Description (PPD) files necessary to use many Apple LaserWriter and third-party PostScript printers.
This article has been archived and is no longer updated by Apple.
The Mac OS X print architecture works with many Apple and third-party PostScript printers: those that are PostScript Level 2 and 3 printers, and that use PostScript Printer Description (PPD) files that describe the set of printer features available for a specific PostScript printer or printer family. For example, a PPD file might include features like:

- the paper-handling capabilities of a printer
- the number of paper trays and their capacity
- available paper sizes they handle

PPD files are created by printer vendors. Mac OS X 10.1 comes with many Apple and third-party PPD files from Hewlett-Packard, Tektronix, Lexmark and Xerox. A list of these printers can be found below. For information on ink jet printers, see technical document 106490: "**Mac OS X 10.1: Many Third-Party Ink Jet Printer Drivers Are Included**"

Choosing a PPD File

A new feature for Mac OS X 10.1 is automatic queue creation for USB PostScript printers that use TBCP. When you connect a USB PostScript printer to your computer for the first time, a printer queue is created automatically, and the proper PPD is associated with that printer. If that printer's PPD is not available, the Generic PPD will be automatically associated with that printer and queue. To associate a different PPD with the USB PostScript printer, open Print Center, delete the old printer from the Printer List, then add a new printer and select the specific PPD file you wish to be used from the Printer Model pop-up menu.

When adding a printer in Print Center that is connected to your printer via AppleTalk, the PPD can also be selected automatically for you, unless you choose one specifically from the Printer Model pop-up menu.

The Mac OS print architecture may automatically select the proper PPD for USB and AppleTalk connected printers. The communication protocols used support bi-directional communication, allowing Print Center to query and obtain from the printer its product name. Another advantage of automatic PPD selection is that when a PPD file is not found in the Mac OS X system, it searches for a PPD in the Classic (Mac OS 9) System Folder, provided the Classic environment has been used at least once or that the Classic System Folder has been selected at least once in the Startup Disk pane of System Preferences. For these and other reasons, you should allow the Mac OS X print architecture to use its automatic selection capabilities when the proper PPD is available.

In contrast, you must manually select the printer's PPD file when adding "LPR Printers using IP". For best results, choose the PPD file that is provided specifically for that printer from the Printer Model pop-up menu. When the specific PPD file for your printer is not available, consider choosing the Printer Model that most closely resembles your printer. For example, select the Lexmark E312 PPD file for use with your Lexmark E310 printer. Selecting the PPD intended for a model of printer similar to yours will often provide you access to more of your printer's capabilities than merely selecting the Generic PPD, which is designed for maximum compatibility with a wide range of PostScript printers.

Mac OS X 10.1 includes PPDs for these PostScript printers:

Xerox DocuPrint N4525 PS
Xerox Phaser 790
Xerox Phaser 2135 PS

Notes

1. Though Mac OS X 10.1 installs the PPDs for the Personal LaserWriter NT, LaserWriter Pro 400, and LaserWriter Pro 405, these printers do not work with Mac OS X, as they are PostScript Level 1 printers. Mac OS X only works with PostScript Level 2 and 3 printers.

2. Some features of certain printers do not work with Mac OS X. For example, a Fax PPD such as the LaserWriter 16_600 PS Fax will allow you to print to this printer but not to fax from it.

3. If your printer is not listed here, try choosing the PPD of a printer that has a feature set similar to your printer. Using a PPD that is not designed specifically for your printer may not provide access to all of your printer's features, and unforeseen problems may be encountered. Before choosing this workaround, check with the manufacturer of your printer to see if they have released a printer-specific PPD for Mac OS X.

4. Apple may add or remove PPD files without notice so this list is subject to change.

Macintosh Manager 2.1: About Macintosh Manager

This document contains a copy of the About Macintosh Manager document included with Macintosh Manager 2.1.
This article has been archived and is no longer updated by Apple.

About Macintosh Manager

This document includes information about additional Mac OS client software for use with the Mac OS X Server. The Macintosh Manager installation will install Macintosh Manager 2.1, a version of AppleShare Client, and Macintosh Manager 2.1 administration software.

Macintosh Manager is Apple's workstation management technology, providing education network administrators with a centralized method of securing Mac OS workstations, controlling student software access, and providing a consistent, personalized experience for students and staff.

AppleShare Client allows client computers to connect to the server. A version of AppleShare Client is installed by default when you install Macintosh Manager 2.1. If you are installing on a 68K-based computer, AppleShare Client 3.8.7 will be installed. If installing on a PowerPC-based computer, AppleShare Client 3.8.8 will be installed.

To administer Macintosh Manager on a server running Mac OS X Server software from a remote Mac OS 9 computer, install the Macintosh Manager administration software using the Custom Install option of the Mac OS Client Installer.

Macintosh Manager 2.1 administration can be used to manage client computers with Mac OS 8.1 or later.

For more information about these software applications, refer to the Admin Guide.pdf file on the CD, the online Help for Macintosh Manager and Server Admin, and late-breaking news which is available in the online Help.

System requirements

Macintosh Manager 2.1 client software requires a computer with:

- Mac OS 8 or 9

AppleShare Client software:

- AppleShare Client 3.8.7 requires a computer running Mac OS 8.1 to 8.5
- AppleShare Client 3.8.8 requires a computer running Mac OS 8.1 or later

Macintosh Manager 2.1 administration software requires a computer with:

- Mac OS 9 or Mac OS X
- At least 64 MB of RAM

Mac OS X: How to Troubleshoot Errors When Running CGIs

Use these tips to help resolve common issues that can arise when enabling CGIs on Mac OS X and Mac OS X Server versions 10.0 and later. This article has been archived and is no longer updated by Apple.
Note: Apple Technical Suport does not offer free technical support for troubleshooting CGI executables.

Use these notes to help troubleshoot your server when CGIs are enabled.

1. If you wish to run AppleScript CGIs, you must be running Mac OS X Server, and you must run the ACGI Enabler application (/Applications/Utilities/). AppleScript CGIs are not supported on Mac OS X 10.3.

2. If you are running non-AppleScript CGIs, be sure to use UNIX line breaks in your file, not Macintosh line breaks.

3 When using TextEdit as a text editor, it should use UNIX line breaks. Be sure not to save as RTF.

4. Be sure that the path to the executable is set properly at the top of the script. For example, this header is incorrect and will generate errors:

#!/usr/bin/local/perl

The perl program is found in /usr/bin, not /usr/bin/local. To verify the path to a program, use the "which" command in Terminal.

5. Be sure that CGI programs have read and execute privileges. You can use the "chmod" command in Terminal to add read and execute privileges. See the "chmod" man page for more information on using this command.

6. If you are running Mac OS X Server, be sure that you have enabled CGI execution for your site in the Server Admin.

7. If you are still seeing errors after following these steps, refer to the Web Server error logs for clues as to why the CGI is failing. In Mac OS X Server, you can use the Log Viewer in Server Admin to see the Web Server Error Log. In Mac OS X, you can use Console to read the logs, which are found in /var/log/httpd.

Mac OS X Server 10.1: How to Enable SSI

This document explains how to enable SSI (Server Side Includes) on Mac OS X Server.
This article has been archived and is no longer updated by Apple.

How to enable SSI

Follow these steps:

1. In Server Admin, click the Internet tab.
2. Click the Web icon and choose Configure Web Service.
3. Click the MIME types tab.
Scroll down to html in the suffix column.
4. Select html.
5. Click Duplicate.
6. Choose "server-parsed" from the Response pop-up menu.
7. Click Save.

Notes

1. Following these steps allows includes to be done with files with the extension .html. If you prefer that only .shtml files be server parsed, then select shtml instead of html in the steps above. See http://httpd.apache.org/docs/howto/ssi.html for more information on SSI.

2. Beyond the Knowledge Base, Apple does not offer free technical support for configuring or using SSI.

Mac OS X 10.1: Cameras and Devices Compatible With Image Capture

The Image Capture application in Mac OS X 10.1 allows you to easily import images and perform related functions. This documents lists compatible cameras and devices.
This article has been archived and is no longer updated by Apple.
Image Capture is a Mac OS X application that offers a variety of features, including:

- Automatically recognizes your digital camera when you connect it to the computer.
- Lets you see thumbnail views of your pictures, rotate them as necessary, and delete any mistakes before you copy them from your camera to your computer.
- Imports movies and audio from compatible cameras that can record them.
- Set the camera date and time to match your computer's clock.

USB Devices Compatible With Image Capture

Canon

- PowerShot S10
- PowerShot S20
- PowerShot S30
- PowerShot S40
- PowerShot S100
- PowerShot S110
- PowerShot S300
- PowerShot A10
- PowerShot A20
- PowerShot G1
- PowerShot G2
- PowerShot Pro90IS
- EOS D30

IXY DIGITAL

- IXY DIGITAL 200
- IXY DIGITAL 300
- DIGITAL IXUS
- DIGITAL IXUS v
- DIGITAL IXUS 300

Hewlett Packard

- PhotoSmart 318
- PhotoSmart C315
- PhotoSmart C500
- PhotoSmart C618
- PhotoSmart C912

Olympus

- C2100UZ
- C3000Z
- C3030Z
- C4040
- Brio 100
- Brio 150
- E-10
- E-100RS
- D370
- D510Z

Epson

- Epson PhotoPC 3100Z

Casio

- Casio QV-3000EX

Fuji

- Fuji FinePix 1400
- Fuji FinePix 2400
- Fuji FinePix 4700
- Fuji FinePix 6300Zoom
- Fuji FinePix S1

Kodak

- DC 220
- DC 240
- DC 260
- DC 265
- DC 280
- DC 290
- DC3400
- DX3500
- DX3600
- DX3700
- DX3900
- DC4800
- DC5000
- MC3

Sony

- CyberShot DSC P1
- CyberShot DSC P3
- CyberShot DSC P5
- CyberShot DSC P20
- CyberShot DSC P30
- CyberShot DSC P50
- CyberShot DSC S75
- CyberShot DSC S85
- CyberShot DSC F505V
- MVC CD300

Nikon

- CoolPix 990
- CoolPix 880
- CoolPix 775
- CoolPix 885
- CoolPix 995

Card Readers

- SanDisk SDDR-31
- Sony MemoryStick Reader/Writer MSAC-1

Note: Additional cameras and devices may work with Image Capture if they comply with one of the following protocols:

- Mass Storage
- Picture Transfer Protocol (PTP)
- Digita
- Custom - requires vendor-specific plug-in for Image Capture. Contact your vendor to see if a plug-in is available for your device.

Mac OS 9.2.1: "can not be installed over the localized version of Mac OS"

International English users must select the correct English to avoid an alert message that Mac OS 9.2.1 "can not be installed over the localized version of Mac OS... ."
This article has been archived and is no longer updated by Apple.

Symptom

When you attempt to install the Mac OS 9.2.1 Update, an alert box with this message appears:

> "This version of Mac OS can not be installed over the localized version of Mac OS on the disk named <diskname> "Please choose a different destination disk, or perform a clean installation."

Solution

If you have an International English version of Mac OS 9, be sure to use the contents of the "International English" folder and not the "English" folder (Figure 1).

Figure 1 Available installation languages

The "English" folder is for North American English Mac OS 9 users upgrading to the North American English version of Mac OS 9.2.1. You can see which English language version you have by opening Apple System Profiler in Mac OS 9. Look under the Software Overview section. It says either "International English" or "US." "US" is North American English.

Mac OS X 10.1: Some Preferences Lost After Using 10.1 Upgrade CD

You lose some preferences when updating to Mac OS X 10.1 with CD-ROM part number 1Z691-3184-A.
This article has been archived and is no longer updated by Apple.

Symptom

The following preferences are lost after updating to Mac OS X 10.1:

- Date & Time control panel settings
- ColorSync
- Monitor Color Calibration
- Classic
- Desktop Picture
- Keyboard Menu
- ScreenSaver

Solution

Set the preferences again.

This happens when updating to Mac OS X version 10.1 from versions 10.0 to 10.0.4 with CD-ROM part number 1Z691-3184-A.
Published Date: Feb 17, 2012

Mac OS X 10.1: Hard Disk Icon Disappears After Changing the Icon

When you try to customize the hard disk icon in Mac OS X 10.1, the icon disappears after the second change.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to customize the hard disk icon, the icon disappears entirely after the second attempt. The name of the hard disk remains.

Solution

Under certain circumstances, the new icon may not be visible until you log out and log back in. Follow these steps:

1. Choose Log Out from the Apple menu.
2. Log back in.
3. Check for the new icon.

If the new icon does not appear, you may have to revert to the default hard disk icon.

1. Click the Finder icon in the Dock.
2. Choose Computer from the Go menu.
3. In the Finder window, select the hard disk for which the icon has disappeared.
4. Choose Show Info from the File menu.
5. Be sure that the area around the missing icon is highlighted. Click it if necessary.
6. Choose Cut from the Edit menu.
7. Close the Show Info window.

The default hard disk icon should now appear. This document may be updated as more information is available. For more information, see technical document 106427, "**Mac OS X: Pasting Custom Icons Does Not Work in All Contexts**".
Published Date: Feb 17, 2012

Mac OS X 10.1: Computer Serial Number No Longer Appears in Software

Reset Parameter RAM (PRAM) to resolve an issue in which the computer's serial number no longer appears in Apple System Profiler or the About This Mac window.
This article has been archived and is no longer updated by Apple.

Symptom

The computer serial number no longer appears in:

- Apple System Profiler
- About This Mac window

Note: On certain computers, in the About This Mac window, you can double-click the version text to reveal the serial number.

Solution

Verify that the most current firmware available for your computer is installed. Firmware updates are available from the **Knowledge Base**. Search for your specific computer or device model.

Mac OS X Update 10.1.3 resolves this issue. See technical document 106704, "**Mac OS X: How to Update Your Software**".

Prior to Mac OS X 10.1.3, you may reset Parameter RAM (PRAM). See technical document 2238 "**Macintosh: How to Reset PRAM and NVRAM**" for instructions.

Note: The serial number may be restored for some but not all computers. If, for example, your computer's logic board had been replaced under warranty service, the serial number would not be retrievable by these methods.

106506 Mac OS X: Start up From Mac OS 9 to Install Firmware Updates

Published Date: Feb 20, 2012

Mac OS X 10.1: Computer May Go to Sleep While Sharing

Under certain circumstances, a Mac OS X computer can go to sleep while File Sharing appears to be active.
This article has been archived and is no longer updated by Apple.

Symptom

The File Sharing computer unexpectedly goes to sleep while it appears to be actively File Sharing. You receive this message:

"The file server's connection has unexpectedly closed down [time and date]."

Solution

To prevent this behavior, follow these steps:

1. Open System Preferences.
2. Click the Energy Saver icon.
3. Click the Sleep tab.
4. Set the "Put system to sleep whenever it is inactive for" slider to Never.
5. Quit System Preferences.

This is the only certain way to prevent the computer from going to sleep while it is sharing files. Being connected to a sharing computer (having it mounted) is not sufficient in itself to prevent the computer from going to sleep or to reset the sleep clock. You might also encounter this behavior if the software you are using locally caches the file being read from the sharing computer. Though it might appear that you are actively reading the file from the sharing computer, there may be no activity between the two at the moment that the defined sleep period expires.
Published Date: Feb 17, 2012

Mac OS X 10.1: Optimizing AirPort Base Station Placement

AirPort Admin Utility 1.4 for Mac OS 10.1 does not have an optimize placement feature, but the AirPort menu item can be used to analyze the signal strength provided by a base station's position.
This article has been archived and is no longer updated by Apple.
You can use different AirPort client computers to check the placement of a base station by performing the following steps:

1. Choose a channel frequency that is different from any frequency used by sources of interference, such as other AirPort networks.
2. Place your base station in a location free from interference.
3. Position multiple clients throughout the area you would like to test.
4. Check the signal strength on the clients from the AirPort menu bar item.

If the client coverage is not optimal:

1. Try repositioning the base station to reduce possible interference
2. In the Admin Utility, use the "Base station density" pop-up menu in the AirPort panel to set the base station density to Low, Medium, or High, depending on how far apart your base stations are from each other.
3. Install additional base stations to increase performance in an area too large or with too much interference for optimal coverage by one base station.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access".**

Mac OS X Server 10.1: Setup Assistant May Stop Responding If TCP/IP Is Set Improperly

Use the steps in this article to resolve an issue in which the Setup Assistant stops responding due to incorrect TCP/IP settings.
This article has been archived and is no longer updated by Apple.

Symptom

The Setup Assistant stops responding.

Solution

Make sure there is a valid router setting if you are upgrading to Mac OS X Server 10.1 from version 10.0.3 or 10.0.4.

The symptom can occur in these situations:

1. The router address is set to the computer's IP address
2. The router address is not set.
3. The network is configured for DHCP, but there is no DHCP server available.

For example, an invalid setting would be:
IP Address: 192.168.43.154
Subnet Mask: 0.0.0.0
Router: 192.168.43.154

If you want to do something along those lines, use this instead:

IP: 192.168.43.154
Subnet Mask: 0.0.0.0
Router: 127.0.0.1

If the computer is set up with this invalid setting, change the router address in the Network pane of System Preferences for the Built-in Ethernet interface. If you don't do this and the Setup Assistant stops responding on the "Port Planning" page, and you are unable to go forward or backward, then start up the computer into single-user mode, and run the following commands:

```
fsck -y
mount -uw /
rm -rf /private/var/db/SystemConfiguration exit
```

This will allow the computer to start up. After this point, when making Network settings, the default router should be set to 127.0.0.1.

Mac OS 9: Pointer Jumps When Copying Files to or From a Zip Disk

You may experience jumpy or erratic pointer movement when copying files to or from a Zip disk.
This article has been archived and is no longer updated by Apple.

Symptom

When copying files to or from a Zip drive on a computer with a USB keyboard and mouse, pointer movement is jumpy or erratic. The behavior is most apparent when the Finder Copy window is the active window.

Solution

- Use a USB Zip drive.

or

- Upgrade to Mac OS X to resolve this issue.

The Zip driver for Mac OS 9 causes the pointer location to be updated less frequently on the screen. However, there is no slowdown of operation.

You can minimize the behavior during file copies to and from the Zip drive by clicking another window to make it active, instead of the Finder Copy window.

Published Date: Feb 20, 2012

Mac OS X Server 10.1: How to Enable Tomcat

Follow the steps in this document to enable Tomcat on Mac OS X Server 10.1.
This article has been archived and is no longer updated by Apple.
Note: These steps are not needed for Mac OS X Server 10.2 or later. The Server Settings application offers a checkbox for "Start Tomcat on System Startup" in the the Configure Web Service window.

Important, before you begin:

1. You will edit the "httpd.conf" file to enable Tomcat. Follow these steps carefully, and be sure not to change files in any other way than specifically described.

2. Before starting, it is recommended that you make a duplicate of the "httpd.conf" file. If you need to reinstall it, delete the 'httpd.conf' file, and change the name of the copy to "httpd.conf" (to match the one you are replacing).

3. A pound sign (#) in the front of a line indicates that the line will not be read by Apache when starting. Removing pound signs, as described, will cause Apache to read the configuration from that line.

4. Beyond the Knowledge Base, Apple does not offer technical support for configuring or using Tomcat. See http://jakarta.apache.org/tomcat/index.html for more Tomcat information.

5. This article explain how to execute commands in the terminal as root. Be careful in typing, and do not execute any other commands than those listed.

How to Enable Tomcat

1. Choose Log Out from the Apple menu.
2. Type "root" as the login user name. Enter your Admin user password, and log in.
3. Open TextEdit.
4. Choose Open from the File menu.
5. In the Go To field, type: `/etc/httpd/`
6. Locate and open the file named "httpd.conf".
7. Scroll to the end of this file, find the lines that read:

```
#LoadModule jserv_module /usr/libexec/httpd/mod_jserv.so
#AddModule mod_jserv.c
#Include /private/etc/httpd/tomcat.conf
```

8. Remove the pound signs (#) from the start of these lines. Do not modify them in any other way.
9. Save the file and quit TextEdit.
10. Open Terminal.
11. Type: `/Library/Tomcat/bin/tomcat.sh start`
12. Press Return. At this point you should see output in the shell showing Tomcat starting up.
13. After Tomcat has started, quit Terminal and choose Log Out from the Apple menu.
14. Log in as your Admin user
15. Open Server Admin and restart the Web server. At this point Tomcat will be running.
16. To verify this, set the document root of your Web site to "/Library/Tomcat/webapps/ROOT/", and visit your server in a Web browser.
17. If you are having difficulties, take a look at the log files in the Server Admin. Tomcat also keeps a log file in /var/log/http/ called 'mod_jserv.log' that you can use Console to read.

Mac OS X 10.1: Directory Services - Authentication and Contacts

This document explains the difference between the Authentication and Contacts sections in the Directory Setup application. In Mac OS X 10.1 the Contacts search policy is not used by any applications.
This article has been archived and is no longer updated by Apple.
Authentication and Contacts are two different types of Directory Service search policies that can return different types of information for users or people. A search policy is when Directory Services looks for information. The Authentication search policy is used by Directory Services to look up user information such as passwords and home directories. It is used when logging in to the computer or when an installer applications asks for an Administrator password.

While the Contacts search policy works, you do not need to set it up in Mac OS X 10.1 because no applications use it. The purpose of the Contacts search policy is to allow applications to look up information about people other than authentication information. An example of this would be an application using a Contacts search policy to look up information from an LDAP server about a person's phone number or address.

AppleWorks 6: Updater Does Not Install, Excel 97 Alert Message

During an upgrade installation of AppleWorks 6, installation is halted by an alert box with a message that mentions Excel 97.
This article has been archived and is no longer updated by Apple.

Symptom

While installing an AppleWorks 6 update over an existing version of AppleWorks 6, an alert box appears with one of the following messages:

"An unexpected error occurred while installing Excel 97.1008:17,-5"
"An error occurred that prevented the installation from completing. Excel 97"

Solution

1. Drag the icon of the updater disk image volume to the Trash.
Note: This icon's filename does not have an extension such as ".smi" or ".img". That file is the disk image file.
2. Double-click the AppleWorks 6 update icon whose filename has a ".smi" filename extension. A new disk icon appears on the desktop.
3. Open the disk icon, and install the update.

To prevent this issue from occurring, see the "ShrinkWrap or ShrinkWrap engine reports an error" section of technical document 75098: "**Software Downloads: Software Format and Assistance**".

Mac OS X 10.1: Nifty - Apple Internal 56K Modem Scripts

There are two sets of scripts listed for the Apple Internal 56K Modem in the modem section of the Network Preferences.
This article has been archived and is no longer updated by Apple.

Symptom

The modem settings located within the network system preferences, has two sets of modem scripts for the internal modem. They are:

1. **"Apple Internal"**
Apple Internal 56K Modem (v.34)
Apple Internal 56K Modem (v.90)

2. **"Nifty - Apple Internal"**
Nifty - Apple Internal 56K Modem (v.34)
Nifty - Apple Internal 56K Modem (v.90)

Solution

The "Nifty" scripts, installed by default, are localized for Japan. Only use these if you are in Japan.

PowerBook G4: How to Find AirPort ID of Preinstalled AirPort Card

This document explains how to find an AirPort card's AirPort ID when it is preinstalled in a PowerBook G4 computer.
This article has been archived and is no longer updated by Apple.
If the computer has Mac OS X, follow these steps:

1. From the **Apple** menu, choose **Location**, and **Network Preferences** from the submenu.
2. From the **Show** pop-up menu, choose **AirPort**.
3. Click the TCP/IP tab.

The AirPort ID is listed at the bottom of the window.

If the computer does not have Mac OS X, locate the serial number label instead. The AirPort ID (or "wireless MAC address") may be printed on the label. If you need help locating the serial number label, see technical document 88060, "**PowerBook G4: How to Find the Serial Number**".

Mac OS X 10.2.8 or Earlier: Issues With Using Double-Byte Characters

This document describes some limitations you may find when using double-byte characters in Mac OS X.
This article has been archived and is no longer updated by Apple.
Mac OS X works with languages that have double-byte character sets, such as Japanese, Chinese, and Korean. Some Mac OS X applications do not recognize these characters, and they may not appear correctly. Following are some of the situations in which this can occur, with steps you can take to resolve the issue.

Using "Find by Content" in Sherlock (Mac OS X 10.0, 10.1) or File > Find (Mac OS X 10.2)

You can use Sherlock (Mac OS X 10.1 and earlier) or Find (Mac OS X 10.2 and later) to search the content of your files. If you have files containing both double-byte characters and Roman characters, Sherlock may not be able to locate a word consisting of double-byte characters. If this happens, try searching for words in the text that use only Roman characters instead.

Note: Find by Content works for Korean documents that use Mac Korean or UTF-16 encoding only. In addition, it does not work on rtf files created with TextEdit, only plain text files.

Setting up your internal modem

When you set up the internal modem using Internet Connect or Network preferences, do not use double-byte characters in the telephone number field.

Connecting to a server

If you connect to a computer with file sharing turned on, or AppleShare (AFP) server volume with a name that uses double-byte characters, the name may not display correctly. You cannot open applications or documents on the volume.

If this happens, try using Roman characters for the names of server volumes.

From a Mac OS 9 computer, you cannot connect to a Mac OS X file sharing volume if your user name contains double-byte characters. To avoid this, choose a user name with only Roman characters.

Using Mail

Double-byte characters may not display correctly in the subject or content of email you receive. If the file name of an attachment displays incorrectly, you can change it.

Seeing the names of items in the Finder

Double-byte characters in the names of disks, server volumes, folders, and files may not display correctly in the Finder. Select the item and choose Show Info from the File menu. Then choose the encoding for the language from the Encoding pop-up menu.

Long file names that you create in Mac OS X using double-byte characters may not display correctly in Mac OS 9. Try giving the file a shorter name.

Using DOS-formatted MO disks

Mac OS X cannot mount Magneto Optical (MO) disks that are DOS-formatted and contain double-byte characters in the disk name. Use disks with only Roman characters in the disk name. In addition, you cannot save files with double-byte characters in the filename on a DOS-formatted MO disk.

Mac OS X 10.1 (Norwegian): Drop Box Has Incorrect Privileges

The drop box in the Norwegian localized Mac OS X 10.1 installation has read-only privileges instead of write-only.
This article has been archived and is no longer updated by Apple.

Symptom

Other users can see the contents of your Drop Box folder but are not able to copy files to it.

Solution

This issue does not affect users created after installation, only the first user created by the Setup Assistant. Follow these steps to set the correct privileges:

1. Click the Finder icon in the Dock.
2. Go to the Home directory of the affected user, and locate the Public folder.
3. Open the Public folder and select the folder Drop Box.
4. Choose "Vis info" from the Arkiv menu.
5. Choose Rettigheter from the drop-down menu in the window that appears.
6. Set Gruppe and Alle to "Kun skrive (mottaksmappe)".
7. Close the window.

To verify that the changes were made, either log in as another user or log on to the computer from another computer on the network.

Apple may address this issue in a future update to Mac OS X.
Published Date: Feb 17, 2012

Mac OS X 10.1: Mac Help Cannot Open System Preferences Panes After Installing an Update

After updating to Mac OS X 10.1 from versions 10.0 to 10.0.4, Mac Help no longer automatically opens the System Preference panes when it normally should.
This article has been archived and is no longer updated by Apple.

Symptom

1. Any Mac Help link that would normally open a System Preferences pane, for example "Open Login preferences for me," does not work. This only affect users created prior to updating to Mac OS X 10.1.

2. Preference panes do not open from Menu bar items.

Examples of Menu bar items that open panes in System Preferences:

- You choose Open Date & Time after clicking the clock in the menu bar.
- You choose Open Energy Saver from the battery menu bar item (available on portable computers).

Solution

This issue occurs when the preferences bundles are no longer associated with System Preferences. To resolve this issue, re-associate the preferences bundles with the correct application. Follow these steps:

1. Choose Go to Folder from the Go menu.
2. Type: `/System/Library/PreferencePanes/`
3. Click Go.
4. Select one of the Preferences (it does not matter which one).
5. Choose Show Info from the File menu.
6. Choose Open with application from the pop-up menu.
7. Click the application selection menu, which is located immediately below and to the left of the menu you just set to "Open with application."
8. Choose Other from the menu (Figure 1).

Figure 1 The Info window

9. In the navigation dialog that appears, choose All Applications from the Show pop-up menu.
10. Use the navigation dialog to locate the Applications folder in your Mac OS X disk. From this folder, select the System Preferences application.
11. Click Add. An alert box with this message appears: "You don't have privileges to change the application for this document only. Do you want to change all similar documents to open with the application 'System Preferences'?"
12. Click Continue.
13. The Info window should now show System Preferences 2.0 as the application used to open preferences (Figure 2).

Figure 2 Choosing System Preferences in the Info window

14. Close the Info window.

System Preferences should now open to the appropriate pane when selected from menu items.

Mac OS X 10.1: Unexpected Behavior When You Log Out, Shut Down, or Restart

After choosing Log Out, Shut Down, or Restart from the Apple menu, you may see a plain blue screen without the spinning disc cursor. The computer may not subsequently shut down or restart as expected.
This article has been archived and is no longer updated by Apple.

Symptom

After choosing Log Out, Shut Down, or Restart from the Apple menu, a plain blue screen appears without the spinning disc cursor. The computer may not subsequently shut down or restart as expected. If you press the Power button on the keyboard (if it has one) a dialog box appears that says: "Are you sure you want to shut down?" If you click Shut Down, the computer returns to the Login Window or logs in automatically, depending on your preferences.

Solution

You can force the computer to restart by pressing Control-Command-Power, or by pressing the reset button on the computer. (It is marked with a triangle.) No data loss should occur when you do this under these circumstances because all open applications were quit and disk cache contents flushed to disk.

Then update to Mac OS X 10.1.2 or later to resolve the issue. This software is available via the Software Update feature of the System Preferences applications, or you can download a standalone installer from Apple Software Downloads (http://www.apple.com/swupdates/).

Apple Pro Keyboard (Italian): Some Special Characters Missing When Using "Italian - Pro" Keyboard Layout

It is not possible to produce some characters with diacritics (such as Ã, Ã, Ã, Ã, Ã, Ã¿, and Ã±) when using the "Italian - Pro" keyboard layout with Mac OS 9 or Mac OS X.
This article has been archived and is no longer updated by Apple.

Symptom

When using Italian Mac OS 9 or Mac OS X, there are two keyboard layouts to choose from, "Italian - Pro" and "Italian".

When you are using the Italian layout, depressing the Option key or Option-Shift key combination will produce some characters with diacritics (Figure 1).

Figure 1 Italian keyboard layout

However, when you use the Italian - Pro layout, some characters with diacritics do not appear (Figure 2).

Figure 2 Italian - Pro keyboard layout

Solution

As a workaround, see technical document 25333: "**Apple Pro Keyboard (Italian): How to produce Special Characters**"

This document lists the keystrokes needed to produce various special characters with the Italian versions of the Apple keyboard and the Apple Pro Keyboard, when using the Italian layout of Mac OS 9 or Mac OS X.

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

Mac OS X: Some Display Calibration Steps Skipped on Some Monitors

When using the Mac OS X Display Calibrator Assistant, some of the steps are skipped with some display models.
This article has been archived and is no longer updated by Apple.
The Display Calibrator Assistant takes you through some or all of the following steps, depending on what type of display you use:

- Set Up, which includes brightness and contrast adjustment
- Native Gamma
- Target Gamma
- Tristimuli Values
- Target White Point

The Set Up step may be skipped on flat-panel (LCD) displays, because they are backlit. The brightness and contrast settings on backlit displays do not usually affect the gamma settings for that display.

The Native Gamma step may be skipped with flat-panel displays, because native gamma does not apply to them. Cathode-ray tube (CRT) displays use the gamma function to determine the relation between the input voltage and the display brightness. Unlike CRT displays, LCD displays are backlit. Because the brightness from the backlight is constant, a native gamma function is not necessary.

The Tristimuli Values step is not necessary on many later display models because the optimized Tristimuli values are already stored in the display and sent to the operating system when the display is connected. If the display provides these optimized values to the operating system, this step is skipped. Tristimuli values are used to control the proportionate levels of red, green, and blue on an RGB display.

Note: In Mac OS X 10.0, some of these steps were enabled when they should not have been. This has been addressed in Mac OS X 10.1.
Published Date: Feb 17, 2012

Mac OS X Server: Windows Clients Log in via SMB With User Short Name

To connect to Mac OS X Server via SMB, a Microsoft Windows client must log in with a "User name" that matches the user Short Name as defined in Mac OS X Server.
This article has been archived and is no longer updated by Apple.

Symptom

Though your Windows user "Full name" matches your Name on Mac OS X Server, attempted SMB connections to the server from the Windows client fail.

Solution

Connect to the server using your Short Name as defined in your user profile in Mac OS X Server (see Figure 1).

Figure 1 Windows user information (left) and Mac OS X Server user information (right)

In Figure 1, the Windows "User Name" is not the same as the Mac OS X Server Short Name. Even though the user's Windows "Full name" matches his Mac OS X Server Name, he is unable to connect. He would need to change his Windows "User name" to "jacobb" to match the Mac OS X Server Short Name.

Mac OS X 10.1: Hot-Plugged USB Speakers Do Not Respond to Volume Change

The Volume menu bar item may not adjust the volume after hot plugging USB speakers. Use System Preferences instead, or update to Mac OS X 10.1.1.

This article has been archived and is no longer updated by Apple.

Symptom

Hot-plugged USB speakers do not respond to volume changes from the Volume menu bar item.

Note: "Hot plug" refers to the ability of USB and FireWire devices to be plugged in and unplugged when the computer is turned on.

Solution

This issue is resolved by updating to Mac OS X 10.1.1, which you may do with the Software Update feature of System Preferences. Even with Mac OS X 10.1.1, you should select your USB speakers in the Sound pane of System Preferences the first time you plug them in.

In Mac OS X 10.1, you can adjust volume after hot plugging by using System Preferences. Follow these steps:

1. Open System Preferences.
2. Click Sound .
3. Click the Output tab.
4. Be sure that your speakers are selected in the Name column.
5. Click the Alerts tab.
6. Be sure that your speakers are selected in the pop-up menu for "Play alerts through."
7. Adjust the volume using the "Main volume" slider.

Mac OS X 10.1 or Later: Services to Which "Connect to Server" May Connect

This document explains which types of service (or protocols) that you can connect to via the Connect to Server command.
This article has been archived and is no longer updated by Apple.
Connect to Server works with these protocols:

- AppleShare (both AppleTalk and TCP/IP)
- SMB/CIFS (Microsoft Windows File Service)
- WebDAV
- NFS

AppleShare

You can discover or browse AppleShare servers using either the AppleTalk protocol or IP. You can also type the server's URL. Type "afp://" and then either the server's DNS name or IP address.

For other file services, there is no option to browse the network. You must type the server's URL.

WebDAV

To connect to WebDAV servers, type the server's URL in this format:

> http://servername.com/path/

NFS

To connect to NFS servers, type the server's URL in this format:

> nfs: //servername.com/path/

For more information, see technical document 25344: "**Mac OS X: Using the Finder to Mount NFS Exports**"

SMB (Windows File Service)

See technical document 106471: "**Mac OS X 10.1: How to Connect to an SMB Volume (Microsoft Windows)**"

Mac OS X: Popping Sound From External Speakers When Waking or Restarting

When a computer using Mac OS X wakes from sleep or restarts, external speakers connected to the computer may make a popping sound.
This article has been archived and is no longer updated by Apple.

Symptom

You hear a popping sound from external speakers when the computer wakes from sleep or restarts.

Solution

The popping sound does not indicate any software issue or hardware failure. This is a normal part of hardware-software initialization after waking from sleep or during startup.
Published Date: Feb 17, 2012

Mac OS X Server 10.1: Windows Clients Create Files Without Group Write Permission

A Microsoft Windows client computer connected via SMB writes files to the server that have read-only permissions for the logged-in user's group.
This article has been archived and is no longer updated by Apple.

Symptom

After a Windows client writes a file to the server, other members of the same group see an alert when trying to write to the file. The alert may say that the user has inadequate permissions or privileges to modify the file.

Solution

There are several possible solutions to this issue. Two are presented here. The easiest solution to have the owner of the file change its permissions after creating it, granting access to group members.

Alternatively, you can edit the /etc/smb.conf file. This causes Windows clients to create files with the same privileges as the folder to which you save a file. The /etc/smb.conf file is dynamically created by Server Admin, so changes you make to this file would normally be overwritten through the normal use of Server Admin. The following steps will prevent that from happening, but they will also prevent you from making changes in the Windows file sharing settings in Server Admin.

1. Open the Terminal (/Applications/Utilities/).
2. At the prompt (#), type:
```
sudo pico /etc/smb.conf
```
3. Press Return. The file opens in the pico text editor within the Terminal window.
4. Use the cursor keys to locate the "global" section of the file, and add this line:
```
inherit permissions = yes
```
5. Press and hold the Control key, then press the "X" key. This saves the file.
6. Press the "Y" key.
7. Press Return.
8. At the prompt, type:
```
sudo chflags uchg /etc/smb.conf
```

Step 8 locks the file. If in the future you want to make changes to this configuration using the Server Admin application, you must unlock the file. Follow these steps to allow unlock it:

1. Open the Terminal.
2. At the prompt, type:
```
sudo chflags nouchg /etc/smb.conf
```
3. Press Return.

Mac OS X Server 10.0, 10.1: Setting Up Multiple Servers to Host User Home Directories

This document outlines the steps required to create a multi-server infrastructure using Mac OS X Server versions 10.0.3 to 10.1.5.
This article has been archived and is no longer updated by Apple.
This document outlines the steps required to create a multi-server infrastructure using Mac OS X Server 10.0.3 to 10.1.5. Before proceeding, you should review Chapters 1 to 4 of the Mac OS X Server Administrator's Guide and the "Understanding and Using NetInfo" whitepaper. These documents are available at the Mac OS X Server product page (http://www.apple.com/macosx/server/). Please read through this entire document carefully before attempting to configure your servers.

Introduction

In this example scenario, one of the servers (parent1.apple.com) will be the NetInfo parent, providing the user and group information for the other servers on the network. There will be three other servers that can each provide various services including file, print and Web. For now, we will focus on each of the three servers hosting the Home directories for the students of a high school.

In addition to spreading user Home directories across multiple servers (for performance reasons), it may be useful to have the users on a specific server divided into multiple share points. One example would be to have the users distributed as follows:

server1.apple.com has the home directories for students with names A to H
server2.apple.com has the home directories for students with names I to Q
server3.apple.com has the home directories for students with names R to Z

As represented by Figure 1, the admin distributes users in different share points, reducing the number of folders per share point. This action reduces complexity to the user and increases security. Each of these servers has four share points in which the user Home directories are located, based upon the student's class year.

Figure 1 Four share points per server, named by class year, distributed by student last name across three servers

Overview of Steps

Preparation

- Create an XML import list of users for each share point hosting user Home folders.
- Each list should contain only the users with Home folders in that share point.
- In this example, we will have 12 user import lists (three servers with four share points each).
- Put some thought into the user ID assignments since you can search on a range of user IDs with Server Admin.

Setting up the parent (parent1.apple.com)

Set up and configure the NetInfo parent server (parent1)

- Install Mac OS X Server and complete the Setup Assistant.
  Note: You may wish to create a startup partition (~5 GB) for the server OS, then use the rest of the drive space as the partition for storing the various share points.
- Install any software updates for the server.

Create the parent domain on parent1

- Use NetInfo Domain Setup to create a parent domain.
- Restart the server. It is necessary to restart the server so that Directory Services will properly recognize the existence of the new parent domain.

Back up the local NetInfo database

- Use the the Terminal (/Applications/Utilities/) to back up the file "local.nidb".

Import all users for a given share point into the network domain of parent1

- Set the Home directory defaults for the parent domain (/NetInfo/root) to server1 and the appropriate share point (that is class_2002 for the seniors).
- Import the user list for that share point (AtoH-2002.xml, for server1's seniors).
- Repeat for the other three share points on server1, changing the Home directory defaults and importing the appropriate user list each time.
- Repeat for server2 and server3 with the user lists for each of their share points.

Setting up the children (server1-server3.apple.com)

Set up and configure the child servers (server1-server3)

- Install and run setup assistant
- **Note:** You may wish to create a startup partition (~5 GB) for the server OS, then use the rest of the drive space as the partition for storing the various share points. If the Users home directory share point is located on a volume other than the startup volume, the "home" attribute will not be correct in the user's record on the parent. You may work around this issue by modifying the "home" attribute of the user record to contain the appropriate path to the home directory sharepoint.
- Be extremely careful when entering networking data or turning off unused ports.
- Install any software updates for the servers.
- Create the share points (class_2002, class_2003, class_2004, class_2005).

Set up the parent-child relationship for each server

- Open NetInfo Domain Setup and authenticate as the Admin user.
- Set up server1, server2 and server3 as children of parent1.

Back up the local NetInfo database of child servers (server1-server3)

- Use the the Terminal (/Applications/Utilities/) to back up the file "local.nidb" on each child server.

Import users into the local domain of server1

- Set the Home directory defaults to local and select the appropriate share point for the first user list.
- Import the user list for that share point (AtoH-2002.xml, for server1's seniors). This step creates the actual Home directories within the share point.
- Repeat for the other three share points on server1, changing the Home directory defaults and importing the appropriate user list each time.
- Repeat the user import process on server2 and server3.

Restore the local NetInfo domain on each child server from the backup

- When the user imports are completed for all four share points on server1, the file "local.nidb" must be restored.
- Repeat the restore process at server2 and server3.

What's Next

Having read through this overview, you should:

1. Completely read through the rest of this document.
2. Place this example in the context of your networking environment.
3. If useful, follow through on the deployment steps listed below.

Step-by-Step Walkthrough

Preparation

The students using this multi-server network will have their Home directories distributed across three servers, so we need to divide the list containing all users into three smaller lists. There should be a list for users with last names starting with different letter ranges, such as A to H, I to Q, and R to Z. Each of these three will then be broken into four lists representing the students graduating in the years 2002, 2003, 2004 and 2005. If these lists still contain more than 4000 users each, then you should consider further dividing them so that you do not import more than 4000 users at a time. Creating share points by class also simplifies the task of removing the large batch of graduates each year.

With this arrangement, the network load should be evenly spread across servers 1 to 3 as students log in and access their documents. The server

parent1 will handle all authentication (and could be used as a Macintosh Manager server if some of the clients are using Mac OS 8 or Mac OS 9).

These user lists now need to be put into the XML format described on page 308 of the Mac OS X Server Administrator's Guide. That can be done in a number of ways including merging the list (as a database) into a text document. Other utilities are also available from third parties to generate an XML import file from a tab delimited text file, such as Passenger or MM Helper.

Example of the minimum user info required for XML import:

```
<user
     loginEnabled = "canLogin"
     isAdminUser = "notAdmin"
     uid = "2001"
     gid = "2003"
     shell = "" >
     <nameList>
          <name
               text = "user2001" />
          <name
               text = "Test User 2001" />
     </nameList>
     <pass
          format = "clearText"
          text = "test2001" />
</user>
```

Note: See page 308 of the Mac OS X Server Administrator's Guide for more detail.

Setting Up the Parent Server (parent1.apple.com)

Installing the Software:

1. Start up your server from the Mac OS X Server CD.
2. Use Disk Utility to partition the drive (optional).
3. Install the server OS onto the desired startup partition of the drive.
4. After installation completes, restart the server.

Setting Up the Server:

1. Complete the Setup Assistant.
2. Be careful when entering the networking information, and verify that it is correct.
3. Restart the server.
4. If your server install CD was version 10.0.3 or 10.0.4, install the Mac OS X Server 10.1 Update.
5. Restart the server.

Creating the NetInfo Parent Domain:

1. At the Login Window, log in as the Admin user.
2. Open NetInfo Domain Setup on parent1.apple.com.
3. Click the lock.
4. Authenticate with the Admin password. A second dialog appears requiring authentication with the root user's password.
5. Authenticate with the root user's password.

Figure 2 Setting as a NetInfo parent

6. Choose "is a NetInfo Parent" from the "This machine" pop-up menu (Figure 2).
7. The field below it should be set to "Static Address".
8. Enter parent1's IP address into the NetInfo Parent Address field, if it isn't already
9. The NetInfo Server Tag should be already set to "network".
10. Save and click OK.
11. Wait for it to finish, usually between one and three minutes.

12. Quit NetInfo Domain Setup.
13. Restart the server.

Backing up the Users & Groups:

1. Open the Terminal (/Applications/Utilities/).
2. Execute this command as the root user:

```
cp -r local.nidb/ local.nidb.bak
```

Importing the first user list (students A to H, 2002):

1. Open Server Admin
2. Click the General tab.
3. Click Users & Groups and select Home Directory Defaults, then /NetInfo/root from the submenu (Figure 3). This sets a default Home directory location for users imported into the NetInfo parent domain (with the tag "network").

Figure 3 Server Admin

4. Click the Custom radio button.
5. In the first field, enter the domain name of server1 (which will host students A to H).
6. In the second field, type "class_2002" for the class_2002 share point on server1 (Figure 4).
7. Click Save and close the window.

Figure 4 Setting the Home directory preference

8. Click Users & Groups again, select Import and then /NetInfo/root from the submenu.
9. Select the XML import file for the first batch of users (AtoH-2002.xml).
10. After the import finishes, check the import log file created for any issues.

Checkpoint: If the first group of users contained over 2000 users, you should restart the server before continuing. This will ensure maximum import speed. The time required to import users can vary substantially depending upon the hardware configuration of the server and the number of group memberships being assigned to users via the XML import. You should expect to see at least 1000 users/hour and could see several times that performance.

Importing the next user list (students A to H, 2003):

1. Click on Users & Groups, select Home Directory Defaults, then /NetInfo/root from the submenu.
2. Click the Custom radio button.
3. In the first field, type in the IP address of server1 (which will host students A-H).
4. In the second field, type in "class_2003" for the class_2003 share point on server1.
5. Click Save and close the window.
6. Click Users & Groups again, select Import and then /NetInfo/root from the submenu.
7. Select the XML import file for the second batch of users (AtoH-2003.xml).
8. After the import, check the import log file looking for any issues.

Checkpoint: If the first and second user lists combined total is over 3000 users, you should restart the server before continuing. This will ensure maximum import speed.

9. To import the remaining user lists for server1, repeat Steps 1 to 8 of this section for students A to H in the classes of 2004 and 2005. Just be sure to change the share point name in Step 4 to match the list you are importing in Step 7.
10. To import the user lists for server2 and server3, repeat the steps used for server1's users. Put students I to Q on server2 and students R to Z on server 3.

Checkpoint: At this point, the Users & Groups list in the Server Admin should display the complete list of users in the path: /NetInfo/root. Home directories will be created in the following steps.

Setting Up the Child Servers (server1, server2 and server3)

Installing the Software:

1. Start up all three servers from the Mac OS X Server CD.
2. Use Disk Utility to partition their drives (optional).
3. Install the server OS onto the desired startup partitions of the drives.
4. After installation completes, restart the servers.

Setting Up the Server:

1. Complete the Setup Assistant for each server.
2. Be careful when entering the networking information, and verify that it is correct.
3. Restart the servers.
4. If you installed version 10.0.3 or 10.0.4, install the Mac OS X Server 10.1 Update.
5. Restart the servers.

Creating the NetInfo Child Domain:

1. At the Login Window of server1.apple.com, log in as the Admin user.
2. Open NetInfo Domain Setup.
3. Click the lock.
4. Authenticate with the Admin password. A second dialog appears requiring authentication with the root user's password.
5. Authenticate with the root user's password.

Figure 5 Setting as a NetInfo Child

6. Choose "connect to a NetInfo Parent" from the "This machine" pop-up menu (Figure 5).
7. The field below it should be set to "Static Address".
8. Enter parent1's IP address into the NetInfo Parent Address field, if it isn't already.
9. The NetInfo Server Tag should be already set to "network".
10. Save and click OK.
11. Quit NetInfo Domain Setup.
12. Repeat Steps 1 to 11 of this section for server2 and server3.

Setting up the share points:

1. At server1, log in as the Admin user.
2. Open the disk or partition where you intend to store the user Home directories.
3. Create the folders to be used as the server's share points (class_2002 to class_2005, as represented in Figure 1).
4. Open Server Admin and log in as the Admin user.
5. Click the General Tab.
6. Click Sharing and select Set Sharing Attributes.
7. Navigate to the "class_2002" folder, select it, and click Choose.

Figure 6 Choosing a share point for sharing attributes

8. Click to select the "Share this item and its contents" checkbox.

Figure 7 Setting sharing attributes (privileges)

9. Save and close the window.
10. Repeat Steps 4 to 9 of this section to set attributes for share points class_2003, class_2004, and class_2005.

11. Repeat Steps 1 to 10 of this section for server2 and server3.

Backing up the Users & Groups:

1. Open the Terminal (/Applications/Utilities/).
2. Execute this command as the root user:

```
cp -r local.nidb/ local.nidb.bak
```

3. Repeat Steps 1 and 2 for server2 and server3.

Importing Users to Create the Home Directories

Importing the user lists:

1. At server1, open Server Admin.
2. Click the General tab.
3. Click Users & Groups and select Home Directory Defaults.

Figure 8 Preparing to import users for a share point

4. Click the Local radio button (Figure 8).
5. Choose the "class_2002" share point from the pop-up menu.
6. Click Save and close the window.
7. Click Users & Groups again and select Import, then /NetInfo/root/server1 from the submenu.
8. Select the XML import file for the first batch of users (AtoH-2002.xml).
9. After the import finishes, check the import log file created for any issues.

Checkpoint: If the first group contained over 2000 users, you should restart the server before continuing. This will ensure maximum import speed.

10. Repeat Steps 3 to 10 of this section for students A to H of class_2003, class_2004, and class_2005.
11. Repeat Steps 1 to 10 of this section for each of server2 and server3, being sure to match the corresponding users lists and share points (students I to Q on server2, and students R to Z on server3).

Restoring the local NetInfo Domain from Backup:

1. Open the Terminal (/Applications/Utilities/).
2. Execute these commands as the root user:

```
rm -r local.nidb
mv local.nidb.bak local.nidb
```

3. Restart the server.
4. Repeat Steps 1 to 3 of this section for server2 and server3.

Additional information

For information concerning possible NetInfo configurations involving Macintosh Manager, please see technical document 106454: "**Macintosh Manager 2.0: Common Setup Strategies**".

Mac OS X 10.1: Gray Screen When Attempting to Start Classic Environment

After installing Security Update 10-19-01, the Classic environment may not be able to start up, causing Classic to stop responding with a gray or white startup window.
This article has been archived and is no longer updated by Apple.

Symptom

After installing Security Update 10-19-01 on an affected computer, the Classic environment stops starting up almost immediately after being opened. A white or gray Classic startup window appears (Figure 1).

Figure 1 A gray Classic startup window

Note: This occurs when no external display is connected to the computer. This could potentially affect any Mac OS X-compatible computer that is operating with a secondary or tertiary video card that does not have a monitor connected to it. This issue primarily affects PowerBook computers with built-in VGA ports, but certain iBook models that include external video ports could display this symptom.

Solution

Update to Mac OS X version 10.1.1 or later. For more information, see technical document 106634: "**Mac OS X Update 10.1.2: Enhancement and Installation Information**"
Published Date: Feb 17, 2012

Mac OS X 10.2: Modem Unable to Dial, "could not open the communications device" Alert

The Mac OS X Modem Update resolves a rare issue in which a built-in modem cannot dial up. You may see an alert box with this message: "Internet Connect could not open the communications device."
This article has been archived and is no longer updated by Apple.

Symptom

After updating or installing Mac OS X 10.2, your computer cannot dial out using the built-in modem. These three symptoms may occur:

1. When you try to dial up using Internet Connect, you see an alert box with this message:

   "Internet Connect could not open the communications device."

2. The Internet Connection Log contains this entry:

   "Failed to open /dev/cu.modem: Device busy."

3. The modem works normally if you start up the computer from Mac OS 9.

Solution

If you have not experienced the symptoms, you do not need to download the Mac OS X Modem Update.

The steps below use the copy of Mac OS 9 that is installed on the affected computer for downloading the update via modem. If you do not have Mac OS 9 installed, you should download the update (as in Steps 3 and 4) from another location, and copy it to a CD-R disc to take back to your computer. If you live near an Apple Store retail location, you may also get help there if necessary. For portable computers, consider going to a location where you could download the update via Ethernet (which includes common broadband Internet services such as cable and DSL).

To download and install the Mac OS X Modem Update, follow these steps:

1. If you have Mac OS 9 installed on the computer, start up the computer from Mac OS 9. For help, see technical document 106667, "**How to Switch Between Mac OS 9 and Mac OS X**".
2. After the computer starts up, connect to the Internet. If you have not previously connected to the Internet in Mac OS 9, see technical document 106869, "**Mac OS 9: How to Connect to the Internet via PPP (Dial-Up Access)**."
3. Go to Apple Featured Software (http://www.apple.com/swupdates/).
4. Search for "Mac OS X Modem Update".
5. Click the "Mac OS X Modem Update: Information and Download" document link.
6. Read the instructions, then download the update. If given the option to decompress the file after downloading it, click Cancel.
7. Restart the computer from Mac OS X. For help doing this, see technical document **106667**.
8. Open the Mac OS X Modem Update, and follow the directions.

Legal information

The Mac OS X Modem Update license agreement permits the reproduction of software once for archival purposes only.

Mac OS X 10.2.8 or Earlier: Delay When Opening Mail Attachment

The application Mail may temporarily stop responding when you open an attachment that causes the Classic environment to start up. This delay does not occur if Classic is already active.
This article has been archived and is no longer updated by Apple.

Symptom

The application Mail may temporarily stop responding when you open an attachment that causes the Classic environment to start up. A spinning disc cursor may be visible during this period.

Solution

This delay and spinning disc cursor are normal while Classic starts up. To avoid the Classic startup delay while using Mail, you can set Classic to start up when you log in. Follow these steps:

1. Open System Preferences.
2. Click Classic.
3. Click the checkbox to select the "Start up Classic on login on this computer" option.

A future release of Mac OS X may change this behavior.
Published Date: Feb 17, 2012

Mac OS X Server 10.0.3: Do not install server Over Mac OS X client

You should not install Mac OS X Server 10.0.3 over Mac OS X (client). Erase the Mac OS X (client) volume before installing Mac OS X Server on it. Erasure is an option in the Installer.
This article has been archived and is no longer updated by Apple.
This does not apply to Mac OS X Server 10.1 or later. See the documentation included with later versions for installation options.

Warning: Be sure to back up any irreplaceable data from the destination volume before erasing it.
Published Date: Feb 17, 2012

Mac OS X 10.2: "You are running Classic without superuser (root) Privileges" Message

Classic does not start up, and an alert message appears with the text " You are running Classic without superuser (root privileges). Ensure that TruBluEnvironment is setuid and owned by root, or reinstall your Mac OS X System Software."
This article has been archived and is no longer updated by Apple.

Symptom

When you attempt to start up the Classic environment, this alert message appears:

> "You are running Classic without superuser (root privileges). Ensure that TruBluEnvironment is setuid and owned by root, or reinstall your Mac OS X System Software."

Note: For other versions of Mac OS X, see these related technical documents:

106278: "**Mac OS X 10.0: You are running Classic without superuser (root) Privileges' Message**"
106639: "**Mac OS X 10.1: You are running Classic without superuser (root) Privileges' Message**"

Solution

Correct the privileges on your Mac OS X startup volume by following these steps:

1. Open Disk Utility (/Applications/Utilities/).
2. Select your Mac OS X startup volume.
3. Click the First Aid tab.
4. Click the Repair Disk Permissions button.

Published Date: Feb 17, 2012

Mac OS X 10.1: Preferences Do Not Open From Menu Items

You may encounter a situation in which a preference pane does not open from a menu bar item.
This article has been archived and is no longer updated by Apple.

Symptom

Preference panes do not open from Menu bar items.

Examples of Menu bar items that open panes in System Preferences:

- You choose Open Date & Time after clicking the clock in the menu bar.
- You choose Open Energy Saver from the battery menu bar item (available on portable computers).

Solution

This resolution to this issue may be found with additional symptom information in technical document 106557, "**Mac OS X 10.1: Mac Help Cannot Open System Preferences Panes After Installing an Update**".
Published Date: Feb 17, 2012

Mac OS X Server: About the Watchdog Process

Watchdog is a process designed to start, monitor, and restart other processes and services as necessary to keep them running in versions 10.0.x through 10.3.x of Mac OS X Server. In versions 10.4 and later, its process monitoring role is replaced by launchd, and its restart function is replaced by watchdogtimerd.
This article has been archived and is no longer updated by Apple.

What is the Watchdog service?

Watchdog is a process designed to start, monitor and restart other processes and services as necessary to keep them running. It "watches" the programs it starts.

Software monitored

In Mac OS X Server 10.0.3 and later, Watchdog is set by default to keep the following services running:

- **slpd**
  The SLP daemon
- **sambaadmin**
  The SMB (Windows) administration daemon
- **serveradmin**
  The Server Admin daemon
- **mailservice**
  The Apple Mail Services daemon
- **mm**
  The Macintosh Manager server

Note: Please see the Mac OS X Server Administrator's Guide to learn more about each of these services.

If a service stops working almost immediately after being started (the current default is less than 10 seconds), watchdog marks that service as "faulty" and stops trying to restart it. This is a safety measure to prevent a situation in which a failing process restarts indefinitely.

Automatic Restart (hardware)

Watchdog also helps restart the server if its operating system becomes unresponsive (a "hang"). On computers that support automatic restart, this option can be activated in the Energy Saver pane of System Preferences. Once activated, Watchdog periodically resets the computer's Power Management Unit (PMU) timer. If this timer expires (which happens if the system hangs), the PMU forces a restart.

Watchdog.conf

The file "watchdog.conf", located in the /etc/ directory, determines what services Watchdog starts and maintains. Each line in the file represents a single application to manage and follows the following form:

- id:action:path args

id:
A unique way to identify the service.

action:
How to monitor a service and what to do if it stops working. The possible action options are:

- off - If the specified service is not running, do not start it. If it is running, stop it.
- boot - Only start the service when watchdog starts. If it stops after that, it is not restarted.
- bootwait - Currently this behaves the same way as boot.
- respawn - Watchdog will restart the application if it stops working.
- now - Watchdog ignores this entry at startup and will actually change the entry in the configuration file to "off". If you change an entry to "now" and force watchdog to reread its configuration file, it will treat that entry as if it were marked "respawn".

path:
The pathname of the target application.

args:
Any command line options.

This is an example watchdog.conf entry from the default watchdog.conf file included with Mac OS X Server:

```
slpd:respawn:/usr/sbin/slpd -f /etc/slpsa.conf    # SLP daemon
```

This entry would be read "identify this entry as 'slpd', start and restart the application as necessary, using the path and command line options /usr/sbin/slpd -f /etc/slpsa.conf." The last item is a comment used to document the entries. Anything after a pound sign (#) is considered a comment and ignored by watchdog.

Custom Events

You can modify watchdog.conf to suit your needs, including any other services or applications you want to start at system startup and keep active. Apple recommends including only command line or BSD-based applications to Watchdog's list of applications.

Event Log

Watchdog keeps a log of its activities in the file "watchdog.event.log", located in the directory /Library/Logs/. You can view this log from the Terminal application or from the Server Admin's Log Viewer module. You can use this log to monitor when Watchdog starts new applications, restarts unresponsive applications, or stops trying to start an application that fails to start. It should be a good first place to start troubleshooting new or modified watchdog.conf entries.

Other Sources of Information

You can find more detailed technical information about controlling the watchdog process, including command line options, signals, and examples, in the man page (accessible via the Terminal application) and the from watchdog.conf file itself.

Published Date: Feb 17, 2012

Mac OS X: Folders With Names That Begin With a Dot Disappear From Finder

If you save a file to a folder with a name that begins with a dot ".", or period, that folder becomes invisible in the Finder.
This article has been archived and is no longer updated by Apple.

Symptom

The New Folder feature of Save and Save As dialogs allows you to create a folder name beginning with dot. This results in the folder being invisible in the Finder or on the desktop. It may seem as if the folder was not created.

Solution

Mac OS X reserves names beginning with the dot for system software items that are not intended to be visible in the Finder. Normally, an alert box with this message appears when you attempt to create a folder or file whose filename begins with a dot:

> "You cannot use a name that begins with a dot ".", because these names are reserved for the system. Please choose another name."

However, the New Folder button is an exception to this rule. If you create a folder in this manner, its contents remain where you saved them, but you will not be able to see the folder in the Finder. You can remedy this by renaming the folder.

Pathname of the invisible folder

First, you must know the pathname of the folder. You can learn how to read and write a pathname with technical document 106419: "**Mac OS: About Folders, Directories, and Pathnames**"

If you named a folder ".myfolder" and saved it on your desktop, then the pathname would be:

> ~/Desktop/.myfolder

If you do not remember where you saved the folder, search on its name in Find or Sherlock.

Determining pathname with Finder Find (Mac OS X 10.2 or later)

Use Find to search for invisible items with the name you made in the search field. If you don't know how, see technical document **107005**.

Determining pathname with Sherlock (Mac OS X 10.1.5 or earlier)

To find an invisible item in Sherlock, you must use the custom search.

1. Open Sherlock.
2. Click the hard disk icon to search your hard disk.
3. Click the radio button for Custom.
4. Click the Custom pop-up menu and choose edit.
5. Click the Advanced Options disclosure triangle.
6. In the bottom right corner, click to select the checkbox next to the pop-up menu that says either "invisible" or "visible."
7. Be sure the pop-up menu is set to "invisible."
8. Click OK.
9. Type the name of the folder you made in the search field, then click the magnifying glass icon.
10. In the Name column of the Sherlock results field, select the folder.
11. Look in the lower pane of the Sherlock window (Figure 1). This pane reveals the path in which the folder is located (Figure 1). Use this path to determine a pathname as given in the example above. Use the tilde (~) character to represent your Home directory so that you will only need type the part of the path beyond your user folder.

Figure 1 Path to ".myfolder" revealed in lower Sherlock pane

Revealing the invisible folder in the Finder

TA20623_Mac_OS_X_Folders_With_Names_That_Begin_With_a_Dot_Disappear_From_Find

You can reveal an invisible folder in the Finder by using the pathname you determined with the Go to Folder command.

1. Click the Finder icon in the Dock.
2. Choose Go to Folder from the Go menu.
3. Type the pathname you determined in the last section.
4. Click Go.
5. Choose As Columns from the View menu. You should now see the formerly invisible folder in the Finder window.
6. Click to select the folder.
7. Choose Show Info from the File menu.
8. Choose Names & Extension from the pop-up menu in the Info window.
9. In the "File system name" field, type a new name that does not begin with a dot.
10. Press Return and close the Info window.
11. If the folder does not appear immediately, choose Log Out from the Apple menu and then log back in.

Published Date: Feb 17, 2012

AirPort: Using with AOL in Mac OS 9

You can use these instructions to connect to America Online in the United States, using minimum software versions of AirPort 2.0 and AOL 5.0.

This article has been archived and is no longer updated by Apple.

AOL customers in the United States using AirPort 2.0 and AOL 5.0 or later software versions can connect to AOL via AirPort.

Notes

1. Sharing your AOL connection among multiple computers requires multiple AOL accounts.
2. AirPort software versions earlier than 2.0 do not connect to AOL. For the latest version, see Apple Featured Software (http://www.apple.com/swupdates/).
3. You must have AOL 5.0 (Build 20.9). Choose About AOL from the Apple menu when AOL is the active application to verify the build number. See your America Online support materials if you need a later version. Beta versions of America Online do not work with AirPort.

Connecting to AOL

Make sure you have America Online 5.0 (build 20.9) or later installed on your computer and that you have an active account with AOL. You also need to enter the AOL access phone number into the AirPort Setup Assistant when connecting via PPP.

There are two different AOL connection types:

- **Standard Dialup (PPP)** - This is for connecting directly to AOL with a dialup modem. Have your preferred AOL access phone number(s) written down.
- **Bring Your Own Access (BYOA)** - This is for connecting to AOL when you are already connected to the Internet. Existing connections can include but are not limited to DSL, cable modems, and non-AOL dialup access (PPP).

This picture shows a dialup configuration, which could be either an AOL Standard Dialup account or a BYOA PPP account:

This pictures illustrates using a cable, DSL, LAN, or other Ethernet connection:

Obtaining dialup access numbers (optional)

There are two ways to get AOL access numbers. The preferred way is to go to http://access.web.aol.com to look up local access numbers. When you do not have access to the Internet, you can follow these steps:

1. Open AOL.
2. Click Setup.

3. Click Expert Setup.

4. Write down the main phone number and alternate phone number for your location.
5. Quit AOL

Connecting Using a Standard Dialup Account

Part 1 - Setting up the AOL client

1. Quit AOL if it is open.

2. Locate the America Online Extras folder on your AirPort 2.0 CD-ROM. Note: Downloaded AirPort 2.0 software does not include this folder. To use AOL with the earlier AirPort Base Station (Graphite), download the extras from America Online Extras for AirPort: Information and Download.

3. Locate the Online Files folder inside the America Online v5.0 folder on your hard disk.

4. Drag the files "AirPort" and "AirPort Connect" from the America Online Extras folder to the Online Files folder.

5. Open AOL and verify that AirPort Connect is selected under the Select Location menu.

The America Online client is now set up. Before you can continue, you need to set up the base station to connect to AOL using AOL access numbers.

Part 2 - Setting up the AirPort Base Station

You can use either the AirPort Setup Assistant or the AirPort Admin Utility to set up the base station.

Setting Up the Base Station Using AirPort Setup Assistant

1. Open the AirPort Setup Assistant, located at Macintosh HD: Applications (Mac OS 9): Apple Extras: AirPort.
2. Select "Set up an AirPort Base Station" in the Introduction panel.
3. Follow the on-screen instructions, entering your America Online access phone number in the Internet Access panel.

Setting Up the Base Station Using AirPort Admin Utility

1. Open the AirPort Admin Utility and connect to your Base Station.
2. Click the Internet tab.
3. Choose either America Online (AOLnet, V.90) or America Online (AOLnet, V.34) from the Connect using menu. Which option you use depends on the access number you use.

4. Enter your first access number in the "Main number" field and if available an alternate number in the respective field.
5. Click Update to load these settings to your base station.

You are finished. After completing these steps, the next time you open AOL, it will connect to the base station over the wireless network,

then the base station will dial AOL and provide service.

Connect Using Bring Your Own Access Accounts

Because the "Bring Your Own Access" account is intended for users who already have a broadband Internet connection, the AOL client is treated the same as other Internet applications. To set up the AOL client to use TCP/IP connections, follow these steps:

1. Open AOL and click Setup.

2. Select the radio button Bring Your Own Access connection and click Next.

3. On the next page you can name the connection. You can ignore the dialing options, since they only apply to dialup modem connections.
4. Click Next.

5. Select "Add a TCP connection" and click Next.

6. After you see this window, click OK, and you are finished. AOL will now connect using your Internet connection, not through a dialup modem.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see AirPort: Requirements for wireless Internet access.

Mac OS X: How to Use Modem AT Commands

You can troubleshoot a modem in Mac OS X using AT commands. This document describes how.

This article has been archived and is no longer updated by Apple.

AT commands make a modem perform certain actions, such as dialing a phone number. Most of these command start with the letters "AT," which is short for "attention". If your modem manufacturer or Internet service provider (ISP) asks you to type AT commands to troubleshoot your modem hardware or your connection, follow these steps to issue the command:

Note: This document does not include the specific commands. Use commands provided by your Internet service provider or modem manufacturer for troubleshooting.

1. Open System Preferences.
2. Click Network.
3. Choose Internal Modem from the Show pop-up menu, or choose the external port to which the modem is connected.
Note: This menu is named "Configure" in Mac OS X versions 10.0 to 10.0.4.
4. Click the PPP Tab.
5. Click PPP Options.
6. Click the checkbox to enable the "Connect using a Terminal window" option.
7. Click OK.
8. Click the Modem tab.
9. Choose any modem script that starts with the words "Null Modem, such as Null Modem 19200" from the Modem pop-up menu.
10. Click Apply Now.
Note: This button is called Save in Mac OS X versions 10.0 to 10.0.4.
11. Open the Internet Connect application.
12. Click Connect. After several seconds, a Terminal window opens. At this point, the modem has not dialed.
13. Type the commands that you were given. When you have finished, click Cancel to end the session, or click Continue to use a connection that you made.

For information about AT commands in Mac OS 9, see technical document TA21981: "**Remote Access: Using the Terminal Window to Send AT Commands**".

Published Date: Feb 20, 2012

Mac OS X: AirPort May Be Called "Ethernet (slot 1)" or "en1"

Some parts of Mac OS X may refer to an AirPort card as "Ethernet (slot 1)" or "en1" instead of "AirPort."
This article has been archived and is no longer updated by Apple.

Symptom

Some parts of Mac OS X refer to an AirPort card generically as "Ethernet (slot 1)" or "en1".

You may see this in:

- The AppleTalk and TCP/IP control panels in the Classic environment
  Note: In Mac OS X 10.2 and later, these two control panels are no longer accessible in Classic.
- The Network Utility
- Many command-line commands related to networking

Solution

If you are not certain which network interface is AirPort, use the Network pane of System Preferences to see the AirPort settings. System Preferences refers to AirPort correctly.

All Macintosh computers that meet the system requirements of Mac OS X include at least one built-in Ethernet port. Some Apple server configurations include a PCI card that has four additional Ethernet ports. When using the affected utilities, having a total of six ports could make it confusing to determine which is AirPort. However, this is not a symptom that indicates a hardware issue or requires any troubleshooting. When viewing an affected utility or control panel, look for other contextual clues such as "wireless" or "11 Megabits per second (Mbps)."

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "AirPort: Requirements for Wireless Internet Access"

Published Date: Feb 20, 2012

AirPort Base Station (Dual Ethernet): LED Behavior

This document describes the Light Emitting Diode (LED) behavior of the AirPort Base Station (Dual Ethernet).
This article has been archived and is no longer updated by Apple.
The LEDs on the AirPort Base Station (Dual Ethernet) provide status information through a series of blinking patterns. Taken in combination with the state of the base station, these patterns provide unique indications. See Figure 1.

The AirPort Base Station (Dual Ethernet) differs from the previous base station in the color of the status LEDs. The earlier base station uses multi-color LEDs (amber, red, and green). The AirPort Base Station (Dual Ethernet) uses a single LED color, white, to provide feedback.

Figure 1 AirPort Base Station (Dual Ethernet) LED sequences

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"
Published Date: Feb 19, 2012

AirPort Base Station (Dual Ethernet): Factory Default Settings

This article provides the default settings for the AirPort Base Station (Dual Ethernet) with AirPort 2.0 software.
This article has been archived and is no longer updated by Apple.

Default Names, Addresses, and Passwords

For all LAN clients:

Base Station Password: public
Subnet Mask: 255.255.255.0

For wireless clients:

AirPort Network Name: Apple Network xxxxxx (see Note 1, below)
Network Password: None

As seen from wireless and wired LAN clients:

AirPort Base Station Name: Base Station
AirPort Base Station IP: 10.0.1.1

As seen from the WAN port:

AirPort Base Station Name: Base Station
AirPort Base Station IP: 192.42.249.13 **or** 169.254.x.x (Note 2)

Default Port Configurations

Ethernet (LAN): Configure via DHCP and network address translation (NAT)
Wireless: Configure via DHCP and network address translation (NAT)
Channel Frequency: 1
Encryption: Off
Closed network: Off
Station density: Low
Multicast rate: 2
Interference Robustness: Off

See Note 3.

For steps on how to reset the AirPort Base Station (Dual Ethernet) to the default state see technical document 106602: **AirPort Base Station (Dual Ethernet): How to Reset**

Notes:

1. The characters "xxxxxx" represent the last six digits of the wireless Ethernet card's MAC address. See the AirPort ID number on the bottom of the base station.

2. The Configure via DHCP setting will obtain an IP address from your Internet service provider when DHCP is available to the base station. One of these two addresses is taken when DHCP service is not available. Base stations with firmware earlier than 4.0.4 take the former address. Base stations with firmware 4.0.4 or later use the latter, link-local address. The 169.254.x.x address is the same type used by Bonjour (formerly "Rendezvous") in Mac OS X 10.2 or later. Base station firmware 4.0.4 or later is provided with AirPort software version 2.0.4 or later. You can download firmware update 4.0.9 here. For more information on link-local addressing, see technical document 107225, "**AirPort 2.0.4: About Using Link-Local Addressing**".

3. The AirPort Base Station is set up properly out of the box (and after a forced reload) to work with a cable modem or DSL modem that obtains its IP information from a DHCP server. On the wireless side, it is set up as a DHCP server with network address translation (NAT) turned on and network encryption off. The default base station password is "public". If you are trying to use the AirPort Base Station in a Microsoft Windows environment, it may not be necessary for you to run the AirPort Setup Assistant. You need only plug in the base station and set up your Windows-compatible computer to access the base station.

4. Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

TA20628_AirPort_Base_Station_Dual_Ethernet_Factory_Default_Settings.pdf

Published Date: Feb 20, 2012

Mac OS X 10.1: "The Classic Environment is Not Responding" Message

When stopping the Classic environment, you may receive an inaccurate message that "The Classic Environment is Not Responding."
This article has been archived and is no longer updated by Apple.

Symptom

After clicking Stop in the Classic pane of System Preferences, an alert box appears with this message:

> "The Classic Environment is Not Responding. You may click Cancel and attempt to save any changes to open documents..."

Note: This issue may occur with certain computers when Mac OS X 10.1 and the Mac OS 9.2.1 System Folder used as the Classic startup System Folder are on different volumes.

Solution

Update to Mac OS X 10.1.2 or later. Use the Software Update pane of System Preferences, or download the update from Apple Software Downloads (http://www.apple.com/swupdates/).
Published Date: Feb 17, 2012

Mac OS X: Issues When Opening Multiple Applications

Opening multiple applications in rapid succession may lead to a situation in which the applications open only partially, into an unresponsive state. The Finder may not respond.
This article has been archived and is no longer updated by Apple.

Symptom

One or more of the following may occur:

- A spinning disc pointer appears and does not change back to an arrow.
- The icon of one or more of the affected applications continues to bounce in the Dock.
- If a bouncing icon is selected in the Dock, an alert with the message "Application Not Responding" appears.
- The Finder does not seem to respond or does not appear after login.

Products affected

- Mac OS X 10.1 to 10.1.1
- Mac OS X Server 10.1 to 10.1.1

Solution

Update to Mac OS X 10.1.2 or later. Use the Software Update pane of System Preferences, or download the update from Apple Software Downloads (http://www.apple.com/swupdates/).

Published Date: Feb 17, 2012

Mac OS X Server 10.1: Setting Privileges to Share FireWire or RAID Hard Disks and Other Removable Media

Mac OS X Server treats FireWire hard disks and certain RAID disks as removable media, so privileges do not behave as those for ATA and SCSI hard disks, which are most often installed internally. Set correct privileges before sharing.
This article has been archived and is no longer updated by Apple.

Privileges for removable disks

Privileges for files and folders on removable media indicate the user "unknown" with a user identification number (UID) of 99. The result of this is that the files and folders act as if owned by whichever user is currently logged in to Mac OS X. However, privilege changes (if any) made by the logged-in user do not persist when that user logs out. When a subsequent user logs in to the computer, the removable disk acts as if owned by the subsequent user.

This behavior preserves the portability of removable disks, the trait for which they are often employed. Superficially, the media behaves as it would if used in Mac OS 9.

Changing privileges behavior

Warning: If you are using Mac OS X Server version 10.0.3 or 10.0.4 and wish to use external FireWire drives for storage, you must update to Mac OS X Server 10.1 to use the steps presented below. Use of removable media for a server is not tested or qualified by Apple, and you should consult the support resources provided by the vendor of your removable media regarding its worthiness for use as a server storage device.

If you wish to share a FireWire hard disk or other appropriate removable media with Mac OS X Server, follow these steps to allow privileges to behave as an internally-installed disk:

1. Select the disk in the Finder.
2. Choose Show Info from the File menu.
3. Choose Privileges from the pop-up menu in the Info window.
4. Click the checkbox to deselect "Ignore privileges on this volume."
5. Close the Info window.

Once this is done, permission changes are preserved on the volume.

Mac OS X 10.1: Do Not Reinstall After Using the Mac OS X Update 10.1.1, 10.1.2, 10.1.3, 10.1.4, or 10.1.5

You should not reinstall Mac OS X 10.1 over an existing installation after the Mac OS X Update 10.1.1, 10.1.2, 10.1.3, 10.1.4, or 10.1.5 has been installed.
This article has been archived and is no longer updated by Apple.
You should not reinstall Mac OS X 10.1 (build 5G64) from CD-ROM over an existing Mac OS X 10.1 installation after the Mac OS X Update 10.1.1 (build 5M28), 10.1.2 (build 5P48), 10.1.3 (5Q45), 10.1.4 (5Q125), or 10.1.5 (5S60) has been installed.

If you need to reinstall Mac OS X 10.1, you should back up data and erase the affected hard disk or partition prior to installation. Follow these steps:

1. Back up important data and documents stored on your Mac OS X 10.1 disk.
2. Erase your Mac OS X 10.1 disk. You may do this from within the Mac OS X 10.1 Installer.
3. Install Mac OS X 10.1.
4. After installation is complete, apply software updates in the order described in technical document 106713, "**Mac OS X 10.1: Chart of Available Software Updates**".

AirPort: About Base Station Density Settings

The Base Station Density setting affects the signal strength preferences of clients in a roaming environment, particularly mobile clients.
This article has been archived and is no longer updated by Apple.
A roaming environment contains multiple wireless access points, such as the AirPort Base Station, that connect to the same wired network. The wireless client device, such as an iBook, chooses an access point from those within range based on criteria that include signal strength. The end result should be transparent to the user of the wireless device, since the wireless access points provide the same access to the wired network.

When a wireless client connects to an access point, the density setting is communicated to the client. This tells the client how "picky" to be about which access point it chooses. The High setting for Base Station Density means that the client is more prone to disconnect from a low-strength signal as a stronger signal becomes available. Essentially, the client is more selective. This means a mobile client switches sooner to a new access point that it is approaching. Were the Base Station Density set to low, it would maintain the connection to the weaker, outgoing signal for a longer period of time.

The Base Station Density setting also affects how sensitive the client's receiver is. When set to High, the receiver ignores more radio "noise," or interference. When set to Low, the client is more susceptible to effects from radio noise.

Notes

1. The density setting affects which networks a client will see when scanning. When connected to a base station that specifies High density, you do not see as many distant networks as you would when connected to a base station that specifies Low density.
2. Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**".

Mac OS X 10.1: AppleTalk Does Not Work After Being Enabled

Use the solution in this document if AppleTalk does not work after you make it active.
This article has been archived and is no longer updated by Apple.

Symptom

- The computer name does not appear on the network when you look for it using AppleTalk from other computers (the Chooser, for example).
- You cannot add an AppleTalk printer in Print Center.
- AppleTalk zones do not appear in the network preference pane (Figure 1).
  Note: Your network must have proper AppleTalk routing for zones to appear.

Figure 1 AppleTalk Zone menu blank in the Network pane

Solution

Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. Make sure that AppleTalk is chosen in the Show pop-up menu for the desired network interface.
4. Click the AppleTalk tab.
5. Verify that the checkbox for "Make AppleTalk Active is selected." If it is not, click to select it and then click Apply Now. Check to see if your issue is resolved. If AppleTalk was already selected and the AppleTalk Zone menu appears as in Figure 1, then continue to the next step.
6. Choose New Location from the Location menu.
7. Type a name for the new location and click OK.
8. Click Apply Now.
9. Switch the location back to your original location ("Automatic" by default) and click Apply Now.
10. Check for AppleTalk zones. They should now appear. If not, try switching between the locations again, being sure to click Apply Now each time.

Notes

1. The issue may persist at this point if you are attempting to use AppleTalk on more than one port (multi-homing). A common scenario includes a computer that has both AirPort and Ethernet active. For more information on addressing this issue, please see technical document 106614: "**Mac OS X: How to Set Up AppleTalk Multi-Homing**"

2. For more related information, see technical document 106260: "**Mac OS X: Computer Name Does Not Appear on Network**"

Published Date: Feb 17, 2012

Mac OS X 10.1: Applications Folder Locked or Cannot Be Modified

In some situations, the Applications folder may be locked or have incorrect permissions after installing Mac OS X 10.1.
This article has been archived and is no longer updated by Apple.

Symptom

When you drag a file or folder to the Applications folder, an alert box with this message appears:

> "The item '<filename>' could not be moved because 'Applications' cannot be modified."

Solution

You should update to Mac OS 10.1.5, then use the Repair Privileges Utility. For information and software download, see technical document 106900, "**Mac OS X: About the Repair Privileges Utility**".
Published Date: Oct 7, 2016

Mac OS X: "The disc ‘Ram‘ could not be modified" Alert

You may be using an improper DVD-RAM disc caddy or have a disc in the UDF format if you see an alert box with this message: "The disc 'Ram' could not be modified."
This article has been archived and is no longer updated by Apple.

Symptom

When copying files to a DVD-RAM disc in UDF format, an alert box appears with this message: "The disc "Ram" could not be modified." You can still read from the disc and copy files from the disc to another volume.

Solution

First, be sure that you are using the DVD-RAM disc caddy provided with the computer. You cannot write to the disc unless it is in the caddy. Next, check the format of the disc. Select the disc in the Finder then choose Show Info from the File menu. The Info window displays the disc format under General Information. Mac OS X writes to DVD-RAM discs formatted in the Mac OS Standard (HFS), Mac OS Extended (HFS Plus), or Unix File System (UFS). If your disc is in the UDF format, you can back up the data on the disc and reformat it to gain the ability to write to the disc. After backing up the data, you can follow these steps:

Warning: This process will erase all data on the DVD-RAM disc. If you decide to format the disc as UFS, the disc will not be available to Mac OS 8 or Mac OS 9.

1. Insert the DVD-RAM disc into the DVD-RAM drive, being sure to use the DVD-RAM disc caddy provided with the computer.
2. Open Disk Utility (/Applications/Utilities/).
3. Click the disclosure triangle next to the DVD-RAM drive and select the DVD-RAM disc below it.
4. Click the Erase tab.
5. Choose Mac OS Standard, Mac OS Extended, or Unix File System from Volume Format pop-up menu.
6. Click Erase.

Published Date: Oct 7, 2016

Mac OS X: How to Delete Printers and Print Job Lists in the Print Center

This document explains how to delete printers and print job lists in the Print Center.
This article has been archived and is no longer updated by Apple.

To delete a single printer or print job

1. Open Print Center (/Applications/Utilities/). The Printer List window appears. If you want to delete a job, choose Show Queue from the Printers menu.
2. Select the printer or print job from the desired list.
3. Click Delete.

To delete multiple printers or print jobs

1. Open Print Center (/Applications/Utilities/). The Printer List window appears. If you want to delete jobs, choose Show Queue from the Printers menu.
2. Command-click each printer or print job you wish to delete. **Note:** Pressing the Command key while clicking allows you to select multiple items.
3. Click Delete.

To delete all printers or all print jobs

Important: If you see a large number of printers in Print Center and are uncomfortable deleting all of them, contact your network administrator first. This option is only available in Mac OS X 10.0 to 10.1.5.

1. Open Print Center (/Applications/Utilities/). The Printer List window appears. If you want to delete jobs, choose Show Queue from the Printers menu.
2. While pressing the Option key, choose Quit Print Center from the Print Center application menu. An alert box appears.
3. Click OK. All printers or print jobs are deleted.
4. Open Print Center and set up the printer(s) you wish to use.

Published Date: Oct 7, 2016

Mac OS X 10.1: File Sharing Name Appears as Localhost to Clients

Your AppleTalk computer name may not appear as expected on the network if the name entered in the Sharing pane of System Preferences contains Simplified Chinese characters.
This article has been archived and is no longer updated by Apple.

Symptom

When other computers browse a network for your computer via AppleTalk, your computer's name does not appear as expected. It appears as the localhost name.

Solution

If the Computer Name as entered in the Sharing pane of System Preferences contains Simplified Chinese characters, the name of the computer when browsed by other computers via AppleTalk will appear as the localhost name or address (rather than the intended name). This behavior is expected. File Sharing works normally despite the appearance of the name.
Published Date: Oct 7, 2016

Mac OS X: "No AppleTalk printers are available" Message

This document explains what to do if this message appears in Print Center: "No AppleTalk printers are available because AppleTalk is currently disabled."
This article has been archived and is no longer updated by Apple.

Symptom

This message appears in Print Center: "No AppleTalk printers are available because AppleTalk is currently disabled."

Solution

Mac OS X can only print to an AppleTalk printer when there is one and only one network interface (or "port") using AppleTalk. AppleTalk is turned off by default and is normally not needed for USB printers. When AppleTalk is off, follow these steps:

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. Choose the name of the port that connects to your printer from the Show pop-up menu.
Note: Prior to Mac OS X 10.1, the Show pop-up menu is named "Configure."
4. Click the AppleTalk tab.
5. Click the checkbox to select "Make AppleTalk Active" for the port that connects to your AppleTalk printer (usually Ethernet).
6. Click Apply Now.

This message may also occur when AppleTalk is active on two or more ports. In that case, you should deactivate the ports you are not using, or turn off AppleTalk on the ports that are not connected to the printer.

Note: Depending on how your network is set up, you may interrupt other services by turning off AppleTalk from a port or deactivating a port that is not connected to the printer.

Deselecting AppleTalk

Using the same steps listed above to access the Network pane, be sure that AppleTalk is only selected for one of the ports listed in the Show menu. This must be the same port connected to the AppleTalk printer.

Deactivating a port

Alternatively, you may deactivate the ports you are not using by following these steps:

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. Choose Active Network Ports from the Show pop-up menu.
Note: Prior to Mac OS X 10.1, the Show pop-up menu is named "Configure," and the Active Network Ports item is named "Advanced."
4. Click to deselect the checkbox next to ports that are not connected to the printer. Be sure the port connected to the printer is selected.
5. Choose the port you left active from the Show pop-up menu.
6. Click the AppleTalk tab.
7. Be sure that the "Make AppleTalk Active" checkbox is selected.
8. Click Apply Now.

You should now be able to select your AppleTalk printer in the Print Center.

For more information, see technical document 106614: "**Mac OS X: How to Set Up AppleTalk Multi-Homing**"

106298: "**Mac OS X: Using AppleTalk With PPPoE**"
Published Date: Oct 7, 2016

Mac OS X 10.0, 10.1: How to Set Up AppleTalk Multi-Homing

Mac OS X versions 10.0 to 10.1.5 provide AppleTalk multi-homing under specific conditions, described in this document.

Note: In Mac OS X 10.2 or later, you may only use AppleTalk on one network interface, or on one of several port configurations of the same network interface (if thus configured). If you try to enable AppleTalk on a second port, you will receive a message reminding you that this will disable it on the first port.
This article has been archived and is no longer updated by Apple.

What is multi-homing?

"Multi-homing" means that your computer can simultaneously appear on two or more networks or network segments. For example: A multi-homing computer could be connected to the Internet using two independent connections from an AirPort card and an Ethernet port.

Note: Most computer users do not require multi-homing, and this document does not explore the motivations for or benefits of multi-homing.

Multi-homing may be limited to particular services or protocols, and the ability of an operating system to multi-home may vary between services and protocols.

Requirements for AppleTalk multi-homing

For AppleTalk, Mac OS X may multi-home when these conditions are met:

1. Each network interface (port) is connected to a separate network segment.
2. Accessible networks may not have any overlapping network numbers.
3. Each network interface must have an AppleTalk seed router on its network segment.

When these conditions are not met, the Network pane of System Preferences will still allow you to make AppleTalk active on multiple ports; but the AppleTalk service will not actually be available on all selected ports.

A common scenario for an AppleTalk multi-homing issue occurs when a portable computer, such as an iBook, is used with an Ethernet port at a desk but with an AirPort card while mobile. If both the Ethernet port and the AirPort Base Station connect to the same AppleTalk network, then AppleTalk may not work as expected. This may appear as behaviors described in these technical documents:

106608: "**Mac OS X 10.1: AppleTalk Does Not Work After Being Enabled**"
106613: "**Mac OS X: 'No AppleTalk Printers Are Available' Message**"

How to manage network interfaces (ports)

Warning: To prevent any potential data interruption or loss, be sure that you have completed any active AppleTalk transactions before following these steps.

When AppleTalk is active on two or more ports and the requirements for multi-homing are not met, you should turn off or "deactivate" AppleTalk on all but one port. Alternatively, you may deactivate ports you are not using. You may quickly switch between configurations in which different ports are active by using the Location feature of the Network pane of System Preferences.

Deactivating AppleTalk on all but one port

You may allow AppleTalk on only one port by following these steps:

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. Select the port from the Show pop-up menu that you wish to use AppleTalk.
Note: Prior to Mac OS X 10.1, the Show pop-up menu is named "Configure."
4. Click the AppleTalk tab.
5. Be sure that the checkbox for "Make AppleTalk Active" is selected.
6. Click Apply Now.
7. Using the Show menu again, select each remaining port and ensure that the "Make AppleTalk Active" checkbox is not selected for that port.

Deactivating a port

You may deactivate all activity on a port by following these steps:

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. Choose Active Network Ports from the Show pop-up menu.
Note: Prior to Mac OS X 10.1, the Show pop-up menu is named "Configure," and the Active Network Ports item is named "Advanced."
4. Click to deselect the checkbox next to ports that you wish to deactivate.
5. Choose the port you left active from the Show pop-up menu.
6. Click the AppleTalk tab.
7. Be sure that the "Make AppleTalk Active" checkbox is selected.
8. Click Apply Now.

Using the Location menu

By default, Mac OS X has one location named Automatic, and all ports are active. The name Automatic is to remind you that Mac OS X has the capacity to automatically search all active network ports for your connection to the Internet. You can create different "locations" in which different ports are active. A "Mobile" location could make only your AirPort card active, and a "Desk" location could make only your Ethernet port active.

Follow these steps to make a new location:

1. Choose New Location from the Location menu.
2. Type a name for your new location, such as Mobile, then click OK. The name of your new location appears in the Location menu. Any changes you make to the Network pane now apply to this location. The previous location ("Automatic" by default) will remain as you left it.
3. Using the steps described in the sections above, use the Show menu to select and set up the ports as appropriate for this location.
4. When finished, click Apply Now.
5. Repeat these steps to create a location for each port on which you use AppleTalk, as works for your environment.

Once you have created locations, you may quickly switch between them by changing the Location menu in the Network pane of System Preferences and then clicking Apply Now.
Published Date: Oct 7, 2016

Mac OS X Server 10.1: Do Not Reinstall Over Version 10.1.1

You should not reinstall Mac OS X Server 10.1 over version 10.1.1.
This article has been archived and is no longer updated by Apple.
You should not reinstall Mac OS X Server 10.1 (build 5K10) from CD-ROM over an existing Mac OS X 10.1.1 installation, which would be after the Mac OS X Update 10.1.1 or the Mac OS X Server 10.1.1 update (build 5N13) has been installed.

If you need to reinstall Mac OS X Server 10.1, you should back up data and erase the affected hard disk or partition prior to installation. Follow these steps:

1. Back up important data, customized configuration files, and documents stored on your Mac OS X Server 10.1 disk.
2. Erase your Mac OS X Server 10.1 disk. You may do this using the Mac OS X Server 10.1 Installer.
3. Install Mac OS X Server 10.1.
4. After installation is complete, install the Security Update 10-19-01, the Installer Update 1.0, the Mac OS X Update 10.1.1, and then the Mac OS X Server 10.1.1 update again.

Mac OS X: Do Not Use the Solidus (/) or "Slash" in a Volume Name

A solidus (/), or "slash," in a volume name may cause a "nonexistent path" alert message when attempting to save a file on that volume.
This article has been archived and is no longer updated by Apple.

Symptom

When attempting to save a file, an alert box with this message appears:

> "Nonexistent path The path (attempted save location) does not exist; create it?"

Products Affected

- Mac OS X 10.1

Solution

Remove the solidus from the volume name.

The alert occurs because Mac OS X uses the solidus to define a path to a location in the file system. The solidus in the volume name is interpreted as an attempt to specify an additional part of the path. For example: If the name of your Mac OS X startup disk was "OSX/10.1", it would be interpreted as an attempt to specify a folder named "10.1" inside the disk "OSX".

Note: This document does not apply to disks using the UFS file format.

Mac OS X 10.1: About Infrared (IrComm) Compatibility

Mac OS X 10.1 works with IrComm, an infrared communication protocol, when used with the PowerBook G4 (Gigabit Ethernet) computer and some third-party USB infrared pods.
This article has been archived and is no longer updated by Apple.
Mac OS X 10.1 works with IrComm, an infrared communication protocol, on the PowerBook G4 (Gigabit Ethernet) computer and some third-party USB infrared pods.

The following computers have built-in infrared hardware that **does not** work with Mac OS X 10.1:

- PowerBook G3 Series
- PowerBook G3 (Bronze Keyboard)
- PowerBook (FireWire)
- PowerBook G4
- iMac 233 (233 MHz, 233 MHz/B)

These computers may communicate more efficiently via Ethernet cables. Infrared's vulnerability to interference (from florescent lighting, for example) and limited ability to operate over relatively short distances make it a less ideal choice for communication than AirPort wireless or Ethernet technologies.
Published Date: Oct 7, 2016

AirPort Base Station (Dual Ethernet): Crossover Cable Not Required

The AirPort Base Station (Dual Ethernet) does not require a crossover cable in situations that would normally require one.

This article has been archived and is no longer updated by Apple.

When connecting the AirPort Base Station (Dual Ethernet) to another device over Ethernet, a crossover cable is not required. Both the WAN and LAN Ethernet ports automatically detect the type of connection, and switch the signal configuration as required. The Ethernet jacks do not accept telephone wire (RJ-11). This has been done to prevent confusion from misplugged wiring. The Ethernet jacks will not allow the clip of telephone wire's connector to insert far enough to lock into place.

Mac OS X: Copy and paste from Excel to Mail or TextEdit results in scrambled text

This article has been archived and is no longer updated by Apple.

Scrambled text may result when you copy and paste from Microsoft Excel into either the TextEdit or Mail application included with Mac OS X.

Note: This document applies to Mac OS X 10.3.9 and earlier.

Symptom

Scrambled or unexpected text appears when you copy and paste from Microsoft Excel into either Mail or TextEdit.

Microsoft Excel uses several data types copying or pasting, some of which do not yet work with Mac OS X. This may result in garbled text and differing results than anticipated.

Solution

Copy and paste the desired information into a plain text format document, then copy and paste it from the plain text document into the affected Mail or TextEdit document.

How to make a plain text document

You can make a plain text document in Mail or TextEdit. Follow these steps:

1. Choose a New document from the File menu in either TextEdit or Mail.
2. Choose Make Plain Text from the Format menu.

Note: If Make Plain Text does not appear in the Format menu, then your document is already plain text. You may have plain text defined as your default format. In Mail, this is set up in the Composing pane of the preferences window. In TextEdit, you can enable the "Rich text" or "Plain text" option in the New Document Format section of the Preferences window.

AppleWorks 6 (Windows): "An unexpected error has occurred, #-38" Message

If the "My Documents" path is set to the root level of a volume, AppleWorks may not allow you to save a document.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to save a document in AppleWorks 6, an alert box with this message appears:

> "An unexpected error has occurred, #-38."

The document is not saved.

Solution

- Update to AppleWorks 6.2 or later to resolve this issue.

Mac OS X 10.1: Some Italian AirPort Help Files Do Not Work

When using AirPort Help under Mac OS X 10.1 (Italian), certain help files cannot be found.
This article has been archived and is no longer updated by Apple.

Symptom

Attempting to view certain AirPort Help files in Mac OS X (Italian) may result in an alert with this message:

> "Non ho trovato il file HTML specificato"

Solution

As a workaround, users familiar with English may view the help files in English by following these steps:

1. Quit the Help Viewer if it is open.
2. Choose System Preferences from the Apple menu.
3. Click International.
4. Click the Language tab (if necessary).
5. Drag English to the top of the Languages list.
6. Quit System Preferences.
7. Open the AirPort Admin Utility application.
8. Choose AirPort Help from the Help menu.

Note: You must repeat these steps to view affected help files in English again after reverting to Italian as the System language.
Published Date: Feb 17, 2012

Mac OS X: Some Services Cause Modem to Connect

Some services may make the modem to connect to the Internet.
This article has been archived and is no longer updated by Apple.
This occurs when you have set up your computer to connect automatically when a TCP/IP application needs to access the Internet. Certain applications or services, such as Web Sharing (Apache), Windows Sharing, and the Directory Access SMB Plug-in, may look for a TCP/IP connection, causing your modem to dial. To avoid this, use Network preferences to change your PPP or PPPoE Options:

For a PPP connection

1. Open System Preferences.
2. Click Network.
3. From the **Show** menu ("Configure" menu prior to Mac OS X 10.1), choose **Internal Modem**.
4. Click the PPP tab, then PPP Options.
5. Deselect the checkbox for "Connect automatically when needed" (or in earlier Mac OS X versions, "Connect automatically when starting TCP/IP applications").
6. Click OK, then click Apply Now.

For a PPPoE connection

1. Open System Preferences.
2. Click Network.
3. From the **Show** menu ("Configure" menu prior to Mac OS X 10.1), choose **Built-in Ethernet** or **AirPort**.
4. Click the PPPoE tab, then PPPoE Options.
5. Deselect the checkbox for "Connect automatically when needed" (or in earlier Mac OS X versions, "Connect automatically when starting TCP/IP applications").
6. Click OK, then click Apply Now.

Mac OS X Update 10.1.2: Enhancements Information

Mac OS X Update 10.1.2 addressed certain issues and updated system software.

This article has been archived and is no longer updated by Apple.

This software has been replaced by a later update. Because later updates include previous enhancements, the following information is still provided for reference. To find current software, see technical document 106713, "**Mac OS X 10.1: Chart of Available Software Updates**".

Enhancements delivered with Mac OS X 10.1.2

In addition to enhancements previously delivered with Mac OS X 10.1.1 (listed below), the Mac OS X 10.1.2 update includes the following:

Networking and Internet Connectivity Enhancements

- Internet Access can dial longer phone numbers.
- The Apple Internal 56K Modem (v.90) script works better with certain earlier Apple internal modems.
- Certain internal modems will now ignore the dial tone when expected.
- Addresses a potential issue in which the computer's IP address may not be updated as expected after changing networks during sleep.
- Windows NT volumes now appear on the desktop more reliably.
- Improves function when multiple IP addresses are assigned to a single Ethernet port.
- Addresses potential situations in which a DHCP address may not be retained after sleep.
- Improves peer-to-peer IrDA networking and includes many additional IrDA networking enhancements.
- A later version of Apache (1.3.22) is included.
- Offers several other DHCP enhancements.
- Includes numerous additional Ethernet networking enhancements.
- Offers wireless IrDA functionality for additional systems, including original PowerBook G4 (Titanium) and PowerBook G3 (FireWire) computers.

Mail Application Enhancements

- Mail mailboxes now function as expected when the mailbox name includes a solidus (slash, "/") character.
- An issue in which the Mail application may unexpectedly change the selected mail message while opening an IMAP mailbox has been addressed.
- HTML mail message headers are now displayed more consistently.
- Enables Mail support for CRAM-MD5 (non-cleartext) authentication.
- Includes other Mail enhancements.

Classic Environment Enhancements

- Classic environment applications now remain synchronized with the system clock when in the foreground (after the computer is put to sleep).
- A potential situation in which an inaccurate message may appear when stopping the Classic environment in the Classic preference pane, has been addressed.
- Resolves a potential kernel panic situation when connecting to a sharepoint in the Classic environment.
- Enhances reliability of certain USB devices in the Classic environment.

Printing, Image Capture, and Peripheral Device Compatibility Enhancements

- Improves Print Center auto-discovery of Epson printers.
- Resolves a potential alert message when deleting images from a type 3 or 4 digital camera.
- Enhances function of certain removable media devices after waking from sleep.
- PC cards (PCMCIA) are more appropriately recognized if inserted during sleep.
- Improves compatibility with UNIX-based LPR print servers.
- Several other USB, FireWire, and SCSI device compatibility improvements are included.
- Expands support for ATA-style PC cards, including IBM Microdrives and digital camera media card readers.

Other Enhancements

- Improved compatibility with Microsoft Office v.X.
- Improved compatibility with MindVision InstallerVise when installing large amounts of data.
- Improves behavior when multiple applications are opened at once.

- Includes Apple DVD Player feature enhancements.
- Resolves a potential issue in which the speaker phase is inverted in certain iMac computers with slot-loading disc drives.
- Improves the responsiveness of the built-in microphone included with certain computers, improving Speech Recognition.
- Addresses a rare issue in which the screen display may become slightly misaligned when using a display attached to a GeForce2 video card.
- Resolves a certain issue in which minor screen artifacts may unexpectedly remain visible on the desktop after moving an item.
- Corrects an issue in which the time zone that includes Ireland and the United Kingdom may not be selectable in the Date & Time preference pane.
- Resolves a situation in which files may unexpectedly become locked when using certain applications.
- Improves copy-paste operations between Classic and Mac OS X-native applications.
- Includes AppleScript 1.8, which includes numerous AppleScript enhancements.
- Includes other audio enhancements.
- Addresses other potential kernel panic situations
- Improves results of QuickTime-based image rotation functions, such as when rotating an image in Image Capture.

Enhancements delivered with Mac OS X Update 10.1.1

Peripheral Device Enhancements

- Works with FireWire drives that use the 911 Oxford chip set.
- Different brands of FireWire-based (DV) cameras can now be swapped successfully while iMovie 2 is open.
- Resolves a potential issue that may occur when transferring information from one FireWire volume to another.
- Resolves a potential issue that could cause a USB mouse to temporarily stop responding.
- Resolves a potential issue that could cause a USB mouse and keyboard to stop responding after waking from sleep.
- Enhances reliability of certain SCSI devices, including Fujitsu MO (magneto-optical) SCSI drives, when used with Power Macintosh G3 All-In-One, Power Macintosh G3 Mini Tower and Power Macintosh G3 Desktop computers.
- Resolves a potential kernel panic situation when disconnecting a USB Q-Drive.
- Includes other general USB device reliability enhancements.

iTunes and CD burning-related Enhancements

- Works with Sony Digital Relay CRX 10U-A2, Sony CRX-1650L-A2, Sony Spressa Professional 10x4x32x, and BUSlink RW-2440FM devices.
- Offers improved reliability when resolving aliases of MP3 files in iTunes.
- Files with a long file name can be copied from a burned CD-ROM to a Microsoft Windows 2000- or Windows NT-based PC more reliably.
- Ejecting blank media with the media eject key (F12) now dismisses "Prepare CD" dialog boxes.
- DVD-RAM discs eject more reliably when used with non-DVD-RAM drives.
- Addresses a certain situation in which a burned CD or DVD disc may disappear from the desktop after being moved to the Trash but does not physically eject from the computer.
- Discs burned with iTunes eject more reliably.
- Addresses a rare issue in which a data CD does not burn as expected when using an external FireWire drive.
- Certain types of audio CDs become available for use more quickly.
- Reduces likelihood of a Prepare CD dialog window appearing while a CD is being burned.
- Enhances functionality of full-screen iTunes visualizations when hardware mirroring is enabled.
- Includes other general iTunes and CD burning enhancements.

iDisk, Internet Connectivity, Networking, and Web Sharing Enhancements

- iDisk works with the WebDAV digest authentication security protocol. You can access your iDisk and transfer files using Windows XP.
- Increases reliability of iDisk volumes that contain a large number of files and folders.
- Addresses an issue in which certain TCP/UDP packets in an oversized Ethernet frame may have been dropped. DHCP addresses may now be received more reliably from a network server or broadband (cable modem / DSL) Internet service provider.
- Resolves an issue in which copying a file larger than 2 GB to a Mac OS X Server host may have failed with an alert message -50.
- Addresses a potential kernel panic situation when connecting to a sharepoint in the Classic environment.
- The PPPoE MTU setting has been refined, improving general PPPoE connectivity.
- Addresses an issue in which an alert message code +1 could occur while accessing an HTTP or FTP URL string that contained a non-escaped character, such as a space.
- A potential situation in which a host could inadvertently connect to its shared volume has been addressed.
- Resolves a potential cause of alert message -30785 that may have appeared when accessing a directory using FTP.
- Resolves a potential cause of alert message -43 that may have appeared when uploading a folder using FTP.
- Permits "file://" URLs to work with file names that contain non-escaped characters, such as a space.
- Corrects certain situations in which an AppleShare (AFP) volume may be unexpectedly disconnected, resulting in a "The file server <name>

has unexpectedly closed down" message.
- Addresses a rare, potential kernel panic situation that may have affected idle computers that route AppleTalk on a network.

Printing and PDF-related Enhancements

- Improves reliability when viewing certain types of PDF documents.
- A potential issue with using a Hewlett Packard LaserJet 1200 printer while the Classic Environment is open has been addressed.
- Provides expanded EPS document printing features.
- The time required to print Microsoft Word documents with certain content to a PostScript printer has been reduced.
- PDF documents can be saved with a percent sign character in the file name.
- Improves the process of selecting an AppleTalk- or USB-based PostScript printer PPD.
- Resolves a potential issue that may occur when printing an AppleWorks document that contains buttons and double-byte characters (such as Japanese).

Finder, Dock, Sleep, and System Settings Enhancements

- Resolves an issue on certain computers in which the system clock could potentially lose a few minutes per day unless a Network Time Synchronization server was used.
- Resolves a potential issue in which the Finder's Clean Up or Arrange By Name feature could result in overlapping Desktop icons.
- Improves performance of Arrange By Name when more than one display is connected.
- If multiple displays are connected, the Dock is no longer positioned to the left-most or right-most side of the non-primary display when moved.
- Enables video mirroring on PowerBook G4 (Gigabit Ethernet) computers.
- Improves sleep mode battery power conservation of certain PowerBook computers.
- Addresses certain potential Finder kernel panic situations.

Enhancements to the application Mail

- Addresses an issue in which the same messages may be received from a POP mail server if no mail rules were defined, regardless of the Delete on Server setting.
- Resolves a potential situation when sending a mail message that contains Japanese characters.
- Addresses an issue that could cause mails with certain HTML content to not display a vertical scroll bar.
- Improves interaction with certain types of IMAP mail servers.
- Improves reliability when opening certain types of message attachments.
- Enriches performance when importing mailboxes messages that contain certain Japanese characters.
- Improves mail account password security.
- Improves behavior when an SMTP mail message cannot be sent. The message is not sent later more than once.
- Enhances reliability when both Mail and Screen Saver are running during idle time.
- Improves reliability of Mail when retrieving a large number of messages from a POP server.
- Addresses a rare situation where a message retrieved from a POP server may not appear as expected.
- Resolves an issue in which the Mail application could potentially produce a kernel panic message and stop responding, if certain mail messages with HTML content were left open.
- Includes other general Mail reliability improvements.

Application-related Enhancements

- Enhances compatibility with Microsoft Office v. X.
- Image Capture works with additional Canon cameras.
- Resolves certain AppleWorks 6.2 application window positioning issues.
- Helps to resolve an issue in which the AppleWorks Magic Wand tool might fail to properly select an object.
- Improves AppleWorks (Japanese language version) performance when inputting two-byte characters.
- Enhances performance of applications that input two-byte characters using a Bottom Input Window, such as SimpleText, iTunes, and the Finder.
- Resolves an issue in which FileMaker Pro may fail to open successfully the first time after installation if the Automatic log in option was not enabled.
- Improves reliability of applications after a password authentication dialog box has been dismissed.
- Adds ability for disk-archiving software to restore multiple-linked files.
- Unsaved vector and floating point context is now preserved during sleep mode. Third-party screen savers that process data during idle time may benefit from this.
- Enhances Apple DVD Player controller (horizontal) animation.
- Apple DVD Player, through its preferences, offers a feature enabling it to open automatically once a DVD-Video disc is inserted.
- Resolves a potential issue that could occur when previewing multiple fonts with DiamondSoft Font Reserve software.
- Improves application reliability when items are dragged from inactive windows.

Mac OS X: Compatible TechTool Deluxe Versions

TechTool Deluxe versions 2.5.3 and later work with Mac OS Extended (HFS Plus) format Volumes on which Mac OS X is installed.

This article has been archived and is no longer updated by Apple.

You receive TechTool Deluxe if you purchase the AppleCare Protection Plan. TechTool Deluxe versions 2.5.3 and later work with Mac OS Extended (HFS Plus) format volumes on which Mac OS X is installed. TechTool Deluxe is not compatible with volumes formatted in the UNIX File System (UFS).

If you are using TechTool Deluxe version 3.0 or later, you must start up the computer using Mac OS X. If you are using TechTool Deluxe version 2.5.3 through 2.5.7, you must start up the computer using Mac OS 9 to get accurate results.

Important: TechTool Deluxe versions 2.5.3 through 2.5.7 may indicate issues that do not actually exist when the computer is started up from Mac OS X, when you use them in Classic mode. Start up the computer from Mac OS 9 before testing with these versions of TechTool Deluxe. You may switch between the operating systems in the Startup Disk pane of System Preferences. When in Mac OS 9, you can make the same selection in the Startup Disk control panel. See technical document 25271: "**TechTool Deluxe: False 'Problems' Reported When Used With Mac OS X 10.0**" for more information.

AppleWorks 6, Mac OS X: Cursor Displaced When Font Smoothing Is Turned Off

The insertion point cursor is displaced if the Font Smoothing feature is deselected when AppleWorks 6 is used in Mac OS X.
This article has been archived and is no longer updated by Apple.

Symptom

The insertion point appears a few characters away from where actual typing occurs.

Solution

Select Font Smoothing in AppleWorks text preferences. You may follow these steps:

1. Choose Preferences from the AppleWorks application menu.
2. Choose Text from the Topic pop-up menu.
3. Click to select the checkbox for Font Smoothing.

Published Date: Feb 17, 2012

AppleWorks 6, Mac OS X: Non-Roman Characters Print in Courier

Chinese or Japanese text may not print correctly from AppleWorks 6 when used with Mac OS X and a PostScript printer.
This article has been archived and is no longer updated by Apple.

Symptom

Printing a document which includes Chinese or Japanese text results in Courier font instead of the designated Asian-language font.

Solution

Use the Print Preview option to print the document from the Preview application. You may follow these steps:

1. Choose Print from the File menu in AppleWorks 6.
2. Click Preview.
3. Wait for the preview to open in the Preview application.
4. Choose Print from the File menu of the Preview application.

Published Date: Feb 20, 2012

Mac OS X: Incorrect Version of Mac Help Opens, Without Expected Content

Mac Help does not display expected content in Mac OS X if Classic Mac Help is already open (in the Classic environment), or Mac Help content in the Classic environment, if Mac OS X Mac Help is already open. First close Mac Help to resolve the issue.
This article has been archived and is no longer updated by Apple.

Symptom

- If Mac Help is already open in the Classic environment, Mac OS X applications may display Classic Mac Help instead of the desired Mac OS X Mac Help.
- If Mac Help is already open in the native Mac OS X environment, Classic applications may display Mac OS X Mac Help instead of the desired Classic Mac Help.

Solution

Close Mac Help in one environment (Classic or Mac OS X) before attempting to open it in the other.
Published Date: Feb 17, 2012

Mac OS X 10.1: "You are running Classic without superuser (root privileges)" Message

This document explains how to resolve a potential issue in which the Classic environment does not start up, giving you an alert message about "superuser (root privileges)".
This article has been archived and is no longer updated by Apple.
Note: This technical document covers one aspect of troubleshooting the Classic environment. For more information, see technical document 106677: "**Mac OS X: Troubleshooting the Classic Environment**"

Symptom

An alert box with one of the following messages appears, and Classic does not start up:

> "You are running Classic without superuser (root privileges). Ensure that TruBluEnvironment is setuid and owned by root, or reinstall your Mac OS X System Software."

Note: For other versions of Mac OS X, see these related technical documents:

106278: "**Mac OS X 10.0: You are running Classic without superuser (root) Privileges' Message**"
106584: "**Mac OS X 10.2: You are running Classic without superuser (root) Privileges' Message**"

Solution

1. Open System Preferences.
2. Click Startup Disk.
3. Select your Mac OS 9 System Folder in the Startup Disk pane.
4. Choose Show All from the View menu.
5. Click Classic.
6. Select your Classic startup volume (the one that contains your Mac OS 9 System Folder).
7. Click Start. Classic should now start up as expected.
8. Choose Show All from the View menu.
9. Click Startup Disk.
10. Select your Mac OS X System Folder in the Startup Disk window.
11. Close the System Preferences window.

If the issue persists, use the Repair Privileges Utility. Your system must be updated to Mac OS X 10.1.5 before using this utility. For information and software download, see technical document 106900, "**Mac OS X: About the Repair Privileges Utility**".

Notes:

1. The Classic System Folder may not work if required software components have been removed from it. In this case, the System Folder will not be a choice in the Startup Disk control panel. If you have this symptom, go to Solution section "B" of technical document 106426: "**Mac OS: 'Startup Disk no longer has a valid System Folder'**"

2. For best results, do not install multiple versions of Mac OS 9 on your Classic startup volume.

Mac OS X Server: Server Admin Agent Stops When in the Console

Server Admin reports that no server is available if you have entered the Console (at the server) from the Login Window.
This article has been archived and is no longer updated by Apple.

Symptom

If you enter the console at the server, the Server Admin Agent does not respond to Server Admin requests, and an alert box with this message appears at any connected Server Admin workstation:

> "The connection to the Server Admin Agent at <domain name or IP address> has been lost. Please try to reconnect later."

Solution

Exit the Console at the server, and the Server Admin Agent will allow Server Admin to reconnect.

This issue with Server Admin is resolved by Mac OS X Server 10.1 and later. However, you still should not leave the server at the Console, because the Window Server process does not run when the server is at the Console. Other server processes rely on Window Server.
Published Date: Feb 17, 2012

Macintosh Manager, Multiple Users: About the Login Window

This document describes the features available from a Macintosh Manager or Multiple Users Login Window.
This article has been archived and is no longer updated by Apple.
The following features are available to clients while at the Login Window:

Restart

By default, the Login Window displays only a Shut Down button. Press the Option key and the Shut Down button changes to a Restart button.

Gain System Access

Press Command + Shift + Escape. Proper authentication is required to enter System Access. For more information, see technical documents:

106901: "**Macintosh Manager 2: How to Gain System Access**"
60147: "**Mac OS X Server: Macintosh Manager - What is System Access?**"

View system information

Basic system information is available under the Apple Menu.

Macintosh Manager versions 1.0 to 1.2.4 display:

- The version of Macintosh Manager installed.

Macintosh Manager versions 1.3 to 1.4.1 display:

- The version of Macintosh Manager installed.
- The AppleTalk name.

Macintosh Manager 2.0 and later display:

- The version of Macintosh Manager installed.
- The AppleTalk name.
- The IP address.
- The Mac OS version.

Force a client to check for updates in the server's databases

Macintosh Manager versions 1.0 to 1.4.1:

1. Press the Option key.

Macintosh Manager 2.0 and later:

1. Press the Control key.

Note: When a Macintosh Manager client is forced to check for updates in the server's databases, the client computer's hard drive will a make an accessing noise. This is normal operation of this function.

The appearance of the Login Window may vary, depending on a few factors, such as running Multiple Users (in stand alone) or Macintosh Manager (connecting to a server). Also, the Login Window for Macintosh Manager clients can be set up in the Macintosh Manager Admin application.

Disconnected menu bar item

Figure 1 Menu bar item indicating no connection to server

When an AppleShare icon with a green "X" over it appears in the Menu Bar (Figure 1), the client is not currently connected to a Macintosh Management Server. To force a client to connect to the server:

1. Select a user.
2. Click Login.
3. At the password screen, click Cancel.

The client should connect to the server.
Published Date: Feb 17, 2012

Mac OS X: "Error code -37" When Copying Files to Earlier AppleShare Servers

An alert box with the message "Error code -37" may appear when you try to copy files from a Mac OS X computer to another computer that is using AppleShare Filing Protocol (AFP) 2.2 or earlier.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears when a Mac OS X computer attempts to copy a file to another computer:

> "Sorry, the operation could not be completed because an unexpected error occurred, Error code -37."

Client operating systems:

- Mac OS X 10.0 to 10.1.5

Note: Mac OS X Server is affected when acting as a client of affected servers.

Solution

When copying to an AFP 2.2 or earlier server, check the full file name of the file being copied to be sure that it is not over 31 characters. Updated server software can accommodate longer file names.

At the client computer:

Some operating systems can be set up to automatically hide file name extensions, such as ".jpg", that appear at the end of file names. When set up this way, the actual file name differs from what is displayed in the graphical user interface (GUI). The Mac OS X Finder window is an example of a GUI. You may be led to think the file name is exactly what you see on screen, though the file system name may actually differ. Mac OS X can hide file name extensions, but Mac OS 9 does not. This means the full name will be displayed in Mac OS 9 and earlier. Users of Microsoft Windows operating systems connecting to these servers may see similar symptoms, since Windows can be set up to hide file extensions. There are several ways to view file extensions in Mac OS X, but these steps describe the two easiest ways:

1. Choose Preferences from the Finder application menu.
2. In the Finder Preferences window, click to select the checkbox for "Always show file extensions."

This will show file extensions for all files in the Finder or on the desktop until you deselect the preference. To view the extension of a single file:

1. Select the file in the Finder.
2. Choose Show Info from the File menu.
3. Choose Name & Extension from the pop-up menu in the Info window.

At the server:

AppleShare Filing Protocol 2.2 and earlier is limited to 31 characters for full file system names. Later versions of the AFP server are not bound by this limitation, allowing users to save files that are longer than 31 characters. Upgrading to Mac OS X Server 10.0.3 or later, which includes AFP 3.0 or later, allows files to be copied with up to 255 characters in a file system name.
Published Date: Feb 17, 2012

AppleShare IP 6.3.3: How to Verify Cache Allocation

This document describes how to verify that the AppleShare IP Maximum Server Memory, or Cache, allocation is set correctly.

This article has been archived and is no longer updated by Apple.

Use the Mac OS Server Admin application to view or adjust the Maximum Server Memory setting. For Mac OS 9 servers, the difference between "Maximum Server Memory" and "Total Available Memory" should be at least 32 MB. For Mac OS 9.1 or later computers, allow a difference of at least 40 MB. These settings may need adjustment if you have a large number of clients, heavy activity, or additional applications active on the server.

Setting the Maximum Server Memory value lower than the recommended value is better than setting it higher. Setting Maximum Server Memory too high may not allow the operating system enough RAM for other tasks.

If a server appears to be running out of memory due to concurrent use of other applications or sustaining heavy load, then adjust the Server Activity slider down to about 80 percent. This helps ensure that the server will not run out of the available resources for other applications.

Adjusting memory for other applications

If other applications are used on the server, remember that you can adjust their memory allocation as well.

1. Quit the application.
2. Select the application in the Finder.
3. Choose Get Info from the File menu.
4. Choose Memory from the pop-up menu in the Info window.
5. Set the desired value in the Preferred Size field.

Use the value in the 'Preferred Size' field of the Memory pane of the "Get Info" window for each application to determine an appropriate adjustment.

Macintosh Manager, Sherlock: "no search sites installed on this channel" Message

You may manually install search sites to address an issue in which Sherlock does not download them for a Multiple Users or Macintosh Manager users.
This article has been archived and is no longer updated by Apple.

Symptom

After opening Sherlock in a Macintosh Manager or Multiple Users environment and selecting Search Internet, an alert box with this message appears:

> "There are no search sites installed in this channel. Sherlock will connect to the Internet and update your channels."

After you dismiss the alert box, no search sites are downloaded.

Solution

Manually copy the search sites into the user's Home directory. These search sites can be copied from another computer that has the appropriate Sherlock search sites installed. These are found in the Internet Search Sites folder, which is in the System Folder.

For Macintosh Manager:

The Search Sites folder is found on the server, at the location:

~/Library/Internet Search Sites

Note: The tilde symbol (~) indicates a user's Home directory.

For Multiple Users:

The Search Sites folder is found on your hard disk, at the location:

Macintosh HD: Users: UserName: Internet Search Sites

AppleShare IP 6.3: "Error -43" Alert

If an alert box with the message "error -43" appears, the Users & Groups Data File may have become unusable.

This article has been archived and is no longer updated by Apple.

Symptom

When a user attempts to log in, the AppleShare IP File Server quits and an alert box with the message "error -43" appears.

Solution

Use the ASIP First Aid Tool to repair the Users & Groups Data File. If ASIP First Aid reports no faults and the issue persists, reconstruct the Users & Groups Data File anyway. If the issue still persists, export the Users and Groups, delete the Users & Groups Data File, then use the AppleShare IP Setup Assistant to recreate the file.

Published Date: Feb 17, 2012

Mac OS 9, Mac OS X: How to Choose an Apple Modem

This document describes which Apple modems use which Apple modem scripts.
This article has been archived and is no longer updated by Apple.
Note: This document does not explain which modem you should buy. Rather, this document explains how to correctly selection an Apple modem in the Modem control panel (Mac OS 9) or Network pane of System Preferences (Mac OS X).

"modem" v. "modem script"

Before connecting to the Internet, you may choose a "modem" from the Modem menu. What you are actually choosing is not the modem -- it is already installed in your computer. What you are choosing is known as a "modem script," a piece of software that controls the way in which the Mac OS communicates with the modem that is connected to your computer.

First, use the following table to determine which modem script is correct for your computer.

Modem Scripts by Computer

Modem Script Name	Computers	Description
Apple Internal 56K Modem (v.90)	iBook - all models iMac - all models PowerBook G3 Series PowerBook G3 Series (Bronze Keyboard) PowerBook (FireWire) PowerBook G4 - all models Power Macintosh G3 (Blue and White) Power Mac G4 - all models	In the United States, this modem script allows communication at speeds up to the FCC maximum of 53 Kilobits per second (Kbps), depending on line condition and other factors.
Apple Internal 56K Modem (v.34)	iBook - all models iMac - all models PowerBook G3 Series PowerBook G3 Series (Bronze Keyboard) PowerBook (FireWire) PowerBook G4 - all models Power Macintosh G3 (Blue and White) Power Mac G4 - all models	Choose this script when your telephone line condition or Internet service provider does not allow for a v.90 connection.
Apple:GV 56K Apple/GV 56K **Note:** These two names are the same modem script. The punctuation of the name varies between Mac OS 9 and Mac OS X.	Power Macintosh G3 All-In-One Power Macintosh G3 Desktop Power Macintosh G3 Mini Tower	This modem script is used for "beige" or "platinum" colored Power Macintosh G3 computers that have the Apple/Global Village internal modem.
PowerBook G3 Internal 56K	PowerBook G3	In the United States, this modem script allows communication at speeds up to the FCC maximum of 53 Kilobits per second (Kbps), depending on line condition and other factors.
PowerBook G3 Int56 (v.34 Only)	PowerBook G3	Choose this script when your telephone line condition or Internet service provider does not allow for a v.90 connection.

Choosing the correct script

After determining your correct modem script, use these steps to choose it. Make sure to follow the steps for the version of Mac OS installed on your computer.

Mac OS 9

1. Choose Control Panels from the Apple menu, then Modem from the submenu.
2. Choose Internal Modem from the "Connect via" pop-up menu.
3. Choose the desired modem from the Modem pop-up menu.
4. Close the control panel.
5. If prompted, save your change.

Mac OS X versions 10.0 to 10.0.4

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. Choose Internal Modem from the Configure menu.
4. If your computer contains an internal modem that does not appear in the Configure menu, choose Advanced from the Configure menu and reselect the Internal Modem.
5. Click the Modem tab.
6. Set the Modem menu to the desired modem.
7. Click Apply Now.

Mac OS X versions 10.1 and later

1. Choose System Preferences from the Apple menu.
2. Click Network.
3. Choose Internal Modem from the Show menu.
4. If your computer contains an internal modem that does not appear in the Show menu, choose Active Network Ports from the Show menu and reselect the Internal Modem.
5. Click the Modem tab.
6. Set the Modem menu to the desired modem.
7. Click Apply Now.

Third-party modems

If you have a modem not manufactured by Apple, use the modem script recommended or provided by the third-party manufacturer. Many third-party modem scripts are included with Mac OS 9 and Mac OS X, so you may be able to choose a modem script without installing additional software.

Macintosh Manager: Login Window Does Not Appear, Client Stops Responding

The Macintosh Manager Login Window may not appear, leaving a non-responsive client with a Menu bar and mouse pointer.
This article has been archived and is no longer updated by Apple.

Symptom

Macintosh Manager client computers may stop responding ("hang") just prior to the time that the Login Window should appear. The Login Window does not appear, leaving the Menu bar and mouse pointer on the screen.

Solution

1. If file sharing is turned on, turn it off.

2. If that does not resolve the issue or is not an acceptable solution, disable the following extensions on the affected clients:

- SLP Flag
- SLPPlugin
- ShareWay IP Personal Bgnd

3. Try renaming a few extensions to change their load order:

- Try renaming "Folder Actions" to "zFolder Actions".
- Try renaming "Application Switcher" to "zApplication Switcher".

Published Date: Feb 17, 2012

Ethernet: Cables Used by Macintosh Computers

This document describes Ethernet cabling used by Macintosh computers.

This article has been archived and is no longer updated by Apple.

Current and recent computers

More recent Macintosh computers, those with a PowerPC G3 or later microprocessor, are fitted for twisted-pair cable with an RJ-45 connector (Figure 1). The RJ-45 port looks like a wide version of a standard RJ-11 telephone jack (Figure 2). The Ethernet port on is located on the back or side of your computer, depending on the model. It is labeled with the Ethernet icon.

Figure 1 RJ-45 Ethernet cable connector

Figure 2 An RJ-45 Ethernet port below the Ethernet icon

This document does not cover the fiber optic Apple Gigabit Ethernet PCI Card. For information on that product, see technical document 58296: "**About Your Apple Gigabit Ethernet PCI Card**"

Earlier computers

Earlier Power Macintosh and Quadra computers have the Ethernet icon, as in Figure 1, but with a different style of port. This is the Apple Attachment Unit Interface (AAUI) port. This type of port requires a transceiver, a small box that adapts the AAUI to the type of cabling used (such as RJ-45). On Power Macintosh computers that came with both an AAUI and RJ-45 port, you can use only one at a time.

Speed rating of cabling

Ethernet cable is available in different speeds. For more information on cable speed, see technical document 106655: "**Ethernet: Speed of Ethernet Cabling**"

Other types of cable

If your Ethernet network does not use twisted-pair, RJ-45 Ethernet cable, you may be able to use a third-party adapter to connect to connect. You may search for third-party products at the Macintosh Products Guide (http://www.guide.apple.com/).

Published Date: Oct 7, 2016

Ethernet: Speed of Ethernet Cabling

This document describes speeds of Ethernet cabling used by Macintosh computers.

This article has been archived and is no longer updated by Apple.

Note: This document does not cover the fiber optic Apple Gigabit Ethernet PCI Card. For information on that product, see technical document 58296: "**About Your Apple Gigabit Ethernet PCI Card**"

Speeds of Ethernet cable

Twisted pair Ethernet cable is available in different grades for different speeds of Ethernet. Your Macintosh computer may use any of the following Ethernet grades:

- 10Base-T (Cat 3)
- 10/100Base-T (Cat 5)
- 10/100/1000Base-T (Cat 5+, Cat 5e, or Cat 6)

Your computer's Ethernet speed

You can look up the speed of Ethernet hardware included with your computer by using the Apple Spec Database (http://www.info.apple.com/applespec/applespec.taf).

Determining your network "speed limit"

A Macintosh computer with a higher speed Ethernet adapter may use a slower-rated cable, but transmission speed is limited to the speed of the cable. Conversely, a slower-rated computer may use a faster rated cable but be limited by its own speed. Hubs and routers may also limit speed of network traffic. Be sure to buy Ethernet cable that is appropriate for your networking goals.

Published Date: Oct 7, 2016

Macintosh: Connecting to an Ethernet Network

This document describes how to connect your Macintosh to an Ethernet network.

This article has been archived and is no longer updated by Apple.

Required cabling

You need an Ethernet cable appropriate for your computer. If you do not have one, see technical document 106654: "**Ethernet: Cables Used by Macintosh Computers**"

Steps to connect

1. Plug one end of an RJ-45 twisted-pair cable into the 10/100Base-T Ethernet port on your computer (Figure 1).

Figure 1 RJ-45 Ethernet Port below Ethernet icon

2. Plug the other end of the twisted-pair cable into an RJ-45 network port on the target device.

The target device may be a router, hub, AirPort Base Station, or another computer. For more information on these options, see technical document 106658: "**Creating a Small Ethernet Network**"

After connecting

After connecting, you may wish to perform File Sharing. For more information, see technical documents:

106461: "**Mac OS X: File Sharing**"
106657: "**Mac OS 8, Mac OS 9: File Sharing**"

Published Date: Feb 19, 2012

Mac OS: Sharing Over the Internet, or Between Remote Networks

Mac OS X and Mac OS 9 can share files between remote networks via TCP/IP, or in other words "over the Internet." This document describes this activity.
This article has been archived and is no longer updated by Apple.
Mac OS X can share over the Internet (TCP/IP), as can Mac OS 9 and AppleShare IP. This allows Macintosh computers in remote locations to share files with any type of Internet connection. To use this feature, you must do at least these three things:

1. Start File Sharing.
2. Make at least one computer available as sharing via TCP/IP, which is automatic in Mac OS X.
3. Connect to the sharing computer from a second computer.

You connect to a remote computer just as you would a local computer, with the exception that you cannot browse by AppleTalk names, such as "Michelle's computer." Instead, you enter the IP address or DNS name.

Making Sharing Available via TCP/IP

Your computer must have a valid IP address to share via TCP/IP. If it does not, see technical document 106659: "**Mac OS: How to Get an IP Address for Connecting to the Internet**"

Steps for making File Sharing available over TCP/IP:

Product	Required Action
Mac OS X	Mac OS X shares via TCP/IP automatically. You do not need to do anything else.
Mac OS 9	Be sure that the checkbox in the File Sharing control panel for "Enable File Sharing clients to connect over TCP/IP" has been selected.
AppleShare IP	Using your server admin application, be sure that services are enabled over TCP/IP in addition to AppleTalk. This option is located in the AppleShare section of the admin application.

Starting and Connecting

Steps for starting file sharing and connecting to a sharing computer are found in technical documents:

106461: "**Mac OS X: File Sharing**"
106657: "**Mac OS 8, Mac OS 9: File Sharing**"
Published Date: Oct 7, 2016

Mac OS X 10.1: Classic May Not Start If Linksys Hub/Router or Wireless Access Point Is Present

Update the firmware on your Linksys hardware to avoid a situation that prevents Classic from starting up.
This article has been archived and is no longer updated by Apple.

Symptom

If your Linksys hub/router or wireless access point is set up to distribute IP addresses via DHCP, Classic does not finish starting up. An Open Transport extension icon may be visible when Classic stops responding.

Solution

Try updating the firmware on your Linksys hardware. You may download an update from the Linksys Firmware Upgrades page (http://www.linksys.com/download/firmware.asp).

Firmware updates are available for these Linksys devices, which may be associated with the symptom described above:

- BEFW11S4 EtherFast Wireless AP + Cable/DSL Router w/4-Port Switch
- BEFW11p1 EtherFast Wireless Access Point + Cable/DSL Router w/PrintServer
- BEFSR81 EtherFast Cable/DSL Router with 8-Port Switch

Notes:

1. This list is not intended to be comprehensive, and updating your firmware does not guarantee a solution.
2. Updating firmware on a non-Apple product may require an emulation environment or the use of a non-Apple computer.
3. You should periodically check for firmware updates on any applicable product, whether it is manufactured by Linksys, Apple, or another company.
4. Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Other Workarounds

If updating the firmware is not an option, use one of the following workarounds:

1. Use static IP addressing instead of DHCP. Please see the materials which came with the product or contact LinkSys for more information.
2. Use AirPort instead <http://www.apple.com/airport/>.

Mac OS X Server 10.0 to 10.1: About NetBoot

This document duplicates the content of the About NetBoot PDF document distributed with Mac OS X Server versions 10.0 to 10.1.5.
This article has been archived and is no longer updated by Apple.
About NetBoot Read this important information before you install NetBoot 2 v.2.0.2 software on your Mac OS X Server. Netboot 2 software is compatible with Mac OS X Server.

NetBoot features have been extended in this release of NetBoot 2. Early NetBoot capable Macintoshes will not be able to use the new feature of obtaining IP addresses from a DHCP server. Newer Macintoshes are all NetBoot capable, although some will need the latest Open Firmware Update to use DHCP. You can obtain the Open Firmware Update at www.apple.com/support. You should run the proper Update on all Macintoshes you plan to use for NetBoot. Refer to the Admin Guide.pdf on the Mac OS X Server CD for more detailed information about this new feature of NetBoot and for system requirements for your NetBoot client machines.

You must install the NetBoot client image provided on this CD. Earlier or updated versions will not have the necessary modifications for the new NetBoot features.

By default, the NetBoot client image searches for a Macintosh Manager server. The NetBoot client image also contains a default user that allows you to get to the Finder when a Macintosh Manager server can't be found. The default user name is NBUser with the password netboot.

To use NetBoot with the earliest Macintoshes you will need to configure NetBoot 1.0 in the NetBoot Setup Assistant.

For more information about NetBoot and Mac OS X Server, visit this Apple Web site:

- http://www.apple.com/macosx/server

For the latest information about this release of Mac OS X Server, open Server Admin Help or Macintosh Manager Help and click More. For the latest news about a particular service, click the service icon in Server Admin, choose Help from the pop-up menu, and then click More. For QuickTime Streaming Server, click the question-mark button in Streaming Server Admin, and then click More.

For information about the support available for this product, see the Professional Software Support Guide included with Mac OS X Server.
Published Date: Oct 7, 2016

Mac OS X: Spinning Disc Cursor When Copying/Pasting From Classic

This document addresses an issue in which the system becomes unresponsive during a Classic copy/paste operation. The spinning disc pointer appears.
This article has been archived and is no longer updated by Apple.

Symptom

The system becomes unresponsive during a copy/paste operation. The arrow pointer becomes a spinning disc pointer.

This occurs when these two conditions are met:

- Copying from a Classic application into a native Mac OS X application
- Classic is set to start when you log in

Solution

This issue is resolved in Mac OS X 10.2. Users of Mac OS X 10.1.2 to 10.1.5 may use the following workaround:

1. Choose System Preferences from the Apple Menu.
2. Click Classic.
3. Click the Start/Stop tab.
4. Deselect the "Start up Classic on login to this computer" option.
5. If Classic is running, stop or restart it by clicking the appropriate button.

For best results, do not use the option "Start up Classic on login to this computer." If Classic is not running, it will start automatically when you open a Classic application or document. If the issue persists:

1. Stop Classic as described in steps 1 to 3 above.
2. Locate your Classic System Folder. It should appear in the first window of the Classic volume and be titled "System Folder."
3. Open the System Folder.
4. Locate these files (it may help to view the window as a list):
   - Classic
   - Classic Support
   - Classic Support UI
5. Drag these files to the Trash.
6. Using the Classic preference pane, start Classic.
7. This message appears as Classic starts up:

   "Some Classic-specific resources need to be added to or updated in your System Folder on <name of your volume>..."

8. Click OK.

Classic will finish starting up.

AppleWorks 6: Files Do Not Retain Finder Label Status

The Label menu in the Info window allows you to distinguish items in the Finder by color coding. Files opened and saved in AppleWorks 6 return to default Label setting of "None."

This article has been archived and is no longer updated by Apple.

Symptom

Opening and saving a file in AppleWorks 6, the file loses its Label information, or status, in the Finder.

Solution

Relabel the file in the Finder after saving, or consider using folders to organize documents instead of Finder labels.

Published Date: Feb 17, 2012

Macintosh Manager: "-5000" Alert Message Involving Stickies and Temporary Items

When using Stickies in the Multiple Users or Macintosh Manager environment, you may see an alert box with a message about insufficient privileges. Additionally, Stickies notes remain at a client computer, rather than following the user. This can make a user's notes visible to the next user of the computer.

This article has been archived and is no longer updated by Apple.

Symptom

1. When you open Stickies then make a change and quit, an alert box with this message appears, and the application does not quit:

"Could not complete the 'quit' command because you do not have the necessary privileges. -5000"

2. Users' Stickies notes do not follow them from one client computer to another, remaining local to the computer where they were typed. Thus subsequent users (including System Access) of the same client computer can see notes of previous users.

Solution

If you encounter Symptom 1, try force quitting Stickies by pressing the Command-Option-Escape key combination.

Note: This option may be disabled by the administrator. If you cannot force quit, the client computer must be force restarted.

Whether or not the MMLocalPrefs extension is enabled will determine which solution is the best to use:

- If MMLocalPrefs extension is enabled, place a copy of the "Stickies file" and "Stickies Preferences" in the Preserved Preferences folder.
- If the MMLocalPrefs extension is disabled, create a "Temporary Items" folder at the root (top level) of the share point that hosts the user's Home directories (/Users by default). This "Temporary Items" folder must allow Read/Write access for these users.

Note: Clients with MMLocalPrefs enabled that are not configured to preserve the Stickies file and Stickies Preferences will see other user's Stickies that were created while logged into the same computer. Similarly, these Stickies can also be viewed and edited while in System Access on the same computer. Preserving the preferences prevents this behavior.

Mac OS X Server: Random AppleShare (AFP) Pauses

Pauses in AFP service may occur randomly for all AFP-connected clients, lasting from several seconds to several minutes. This document discusses how to resolve this issue.
This article has been archived and is no longer updated by Apple.

Symptom

AppleShare (AFP, or Apple Filing Protocol) is the most common protocol used to connect from a Mac OS client to a Mac OS Server for file sharing purposes. AFP is used when a client connects to the server through the Chooser and is the default protocol used by the Network Browser or the Connect to Server command in Mac OS X. You may see these AFP symptoms:

- Any client computer connected to a Mac OS X Server via AFP may temporarily become unresponsive (a "hang").
- The network activity indication arrows found in the left corner of the menu bar may appear solid during these pauses.
- These pauses may last anywhere from a few seconds to 10 minutes or more.
- The server may appear to be functioning normally during these pauses.
- These pauses appear to end as randomly as the appear.

Solution

Install these software updates on the server:

Mac OS X Update 10.1.4, or later
Mac OS X Server 10.1.4 Update, or later

You may download these software updates from Apple Software Downloads (http://www.apple.com/swupdates/).
Published Date: Feb 17, 2012

Troubleshooting the Classic environment in Mac OS X

Learn what to do if the Classic environment doesn't start up, quits unexpectedly, or stops responding ("freezes").
This article has been archived and is no longer updated by Apple.

Classic won't start

If Classic won't start, see these informative articles:

Mac OS X: Classic Will Not Start Up - Mac OS 9 Not Installed or Not Blessed
Mac OS X 10.3: The Classic Environment Fails to Start or Stops Working

Classic begins to start up, but it does not finish

Classic may almost complete a normal startup, but then stall without any other hint of an issue.

In some cases, Classic might not start up due to an extensions conflict or "bus error".

A Linksys hub/router or wireless access point may also keep Classic from starting in Mac OS X 10.1.

Gray Screen - Classic startup stops (or "freezes") at a gray screen

Classic startup stops at a gray screen, and there is no indication of an extensions conflict or "bus error" in the Classic startup window.

Classic unexpectedly quits or stops responding

Classic may unexpectedly quit and the Dock no longer indicates that individual Classic applications are open. Alternatively, Classic may continue to run but become unresponsive to input. An alert box may appear with this message:

> "The Classic Environment is Not Responding. You may click Cancel and attempt to save any changes to open documents..."

During copy/paste, Classic stops responding ("freezes") with a progress indicator

See Mac OS X: Spinning Disc Cursor When Copying/Pasting From Classic
Published Date: Oct 7, 2016

Mac OS X: Classic Will Not Finish Starting Up - Extension Conflict or "Bus Error"

During Classic startup you may see signs of an extension conflict or "bus error." Use this document to troubleshoot the issue.
This article has been archived and is no longer updated by Apple.
Note: This technical document covers one aspect of troubleshooting the Classic environment. For more information, see technical document 106677: "**Mac OS X: Troubleshooting the Classic Environment**"

Symptom

Classic begins to start up, but it does not finish. If you have clicked the disclosure triangle to view the entire Classic startup window, you may see evidence of an extension conflict or a "bus error." In an extension conflict, you may note that the process halts as the extension icons are being drawn across the bottom of the Classic startup window. If a "bus error" occurs, an alert box with a message may appear.

Solution

You must troubleshoot an extensions conflict or "bus error" just as you would were the computer actually starting up from Mac OS 9, with one exception: You may access the Extensions Manager through the Classic pane of System Preferences. Follow these steps:

1. Choose System Preferences from the Apple Menu.
2. Choose Classic from the View menu. The Classic pane appears.
3. Click the Advanced tab.
4. Choose Open Extensions Manager from the Startup Options pop-up menu.
5. Click Start Classic.

When Classic starts up, Extensions Manager will open and you can proceed according to standard extensions troubleshooting procedures. For more information on using Extensions Manager, see technical document 30929: "**Mac OS: Extension Conflict Troubleshooting/Extensions Manager Features**"
Published Date: Oct 7, 2016

Mac OS X: Classic Quits Unexpectedly or Stops Responding ("Freezes")

Classic may quit unexpectedly or stop responding to input (a "freeze"). Use this document to troubleshoot the issue.
This article has been archived and is no longer updated by Apple.
Note: This technical document covers one aspect of troubleshooting the Classic environment. For more information, see "Mac OS X: Troubleshooting the Classic Environment"

Symptom

You may receive an alert box with this error message:

> "The Classic Environment is Not Responding. You may click Cancel and attempt to save any changes to open documents..."

If you have this message, stop here and go to "Mac OS X 10.1: 'The Classic Environment is Not Responding' Message".

These signs indicate that Classic has quit:

- No alert box appears, but the Dock no longer indicates that individual Classic applications are open.
- In the Classic pane of the System Preferences application, you see the message "Classic is not running."

These signs indicate that Classic is running but not responsive:

- Even though the Classic pane of the System Preferences application says "Classic is running" or "Classic is starting," you cannot open any Classic applications.
- You are using a Classic application that no longer accepts input (a "freeze").
- A blank menu bar appears when you attempt to bring a Classic application to the foreground

Solution

Quit the nonresponsive Classic application or environment

Choose Force Quit from the Apple Menu or use the Command-Option-Escape key combination to access the Force Quit dialog box.

Note: With Mac OS X 10.1.3, you can force quit individual Classic applications. With Mac OS X 10.1.2 and earlier, force quitting has the same effect as force quitting the entire Classic environment.

Determining the cause

An extensions conflict may contribute to undesirable behavior in Mac OS 9 or the Classic environment. You should first try extensions troubleshooting. For information on extensions troubleshooting, see:

106679: "Mac OS X: Classic Will Not Finish Starting Up - Extensions Conflict or 'Bus Error'"
30929: "Mac OS: Extension Conflict Troubleshooting/Extensions Manager Features"

If extensions troubleshooting does not resolve the issue, some files or system software may have been damaged become unusable. This may happen over time, particularly if the computer has often been improperly shut down or improperly restarted.

- Try reinstalling the applications that are in use when Classic quits.
- If that does not help, perform a clean installation of Mac OS 9. For information on a clean installation, see:

  58176 "Mac OS 8.5, Mac OS 9: Performing a Clean Installation"
  107383: "Mac OS X 10.2: How to Perform Mac OS 9 Clean Installation With 10.2 Restore CDs"

  Warning: Be sure to use a Mac OS 9 "installation" disc and not a "restore" disc. A restoration disc is clearly labeled, such as "Power Macintosh G3 Software Restore." These installers differ significantly in the way they work. Recovery from a software restore situation is covered by "Mac OS X 10.0: How to Reinstall Mac OS 9 or Recover From a Software Restore".

Published Date: Oct 7, 2016

AirPort Base Station (Dual Ethernet): How to Reload Software From Mac OS 9

This document explains how to reload software to an AirPort Base Station (Dual Ethernet) that has been hard reset from an AirPort Admin computer that is started up from Mac OS 9.
This article has been archived and is no longer updated by Apple.
Your base station must be in hard reset mode to follow these instructions. If you have not already reset the base station, see technical document 106602: "**AirPort Base Station (Dual Ethernet): How to Reset**"

Follow these steps to upload software to the AirPort Base Station (Dual Ethernet):

1. Connect a computer to the LAN port on the base station with an Ethernet cable. Either standard or crossover type cable will work. The connecting computer must have the AirPort Admin Utility 2.0 or later installed.
2. Choose Control Panels from the Apple menu, then TCP/IP from the submenu.
3. Choose Ethernet from the "Connect via" pop-up menu.
4. Choose Using DHCP Server from the Configure pop-up.
5. Close the control panel, clicking Save if prompted.
6. Open the AirPort Admin Utility. There may be a slight timeout delay while your computer determines that there is no DHCP service available and assigns itself a default IP address in the 169.x.x.x range.
7. Click Configure. You should then see a message that says: "The base station you have selected has been reset and is currently not configured."
8. Click OK.
9. After the AirPort Admin Utility reloads the software, you may perform further configuration or quit the application to use the base station in its factory default state.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"
Published Date: Oct 7, 2016

AirPort Base Station (Dual Ethernet) : How to reload software from Mac OS X

Learn how to use a Mac OS X computer to reload software to an AirPort Base Station (Dual Ethernet) after the base station has been hard reset.
This article has been archived and is no longer updated by Apple.
Your base station must be in hard reset mode to follow these instructions. If you have not already reset the base station, see Resetting the AirPort Base Station (Dual Ethernet).

Important:

1. Be sure to review the Notes referenced in the individual steps.
2. **You may not be able to complete the procedure if you do not review the notes, particularly Note 3 for Step 15.**

Follow these steps to upload software:

1. Connect a computer to the LAN port on the base station with an Ethernet cable. Either standard or crossover type cable will work. The connecting computer must have the AirPort Admin Utility 2.0 or later installed.

   The LAN port icon:

2. Choose System Preferences from the Apple menu.
3. Click Network.
4. Look at the Location menu, and note what it says now. The default setting is "Automatic", but you may have changed it. You will need to know this later.
5. Choose New Location from the Location menu (see Note 1).
6. Type: AirPort Reload
7. Click OK.
8. Choose Network Port Configurations from the Show Menu (Note 2).
9. Because you created a new location, all ports in the list should be checked. If an AirPort card is installed, uncheck it.
10. Choose the Ethernet port from the Show menu.
11. Click the TCP/IP tab.
12. Choose Manually from the Configure pop-up menu, and type this information in the corresponding fields:

    IP Address (Note 4): 192.42.249.14
    Subnet Mask: 255.255.255.0
    Router: 192.42.249.13

13. Click Apply Now.
14. Open the AirPort Admin Utility.
15. Select the base station. If the base station is not listed see Note 3.
16. Click Configure. You should then see a message that says: "The base station you have selected has been reset and is currently not configured."
17. Click OK.
    Note: When you are prompted to authenticate here, the Mac OS X user name and password are required (not the base station password).
18. After the AirPort Admin Utility reloads the software, quit the AirPort Admin Utility.
19. In System Preferences, choose your original location from the Location menu (which you noted in Step 4), then click Apply Now. This restores your original network settings.
20. If you need to change the configuration of your base station, you may now reopen the AirPort Admin Utility (Note 5). Otherwise, you can use the base station in its factory default configuration.

Notes:

1. Step 5 uses the Location menu to avoid disturbing your original network settings. Step 19 restores your original network settings. To learn more about this feature, see Mac OS X: How to Use Locations. You may delete the "AirPort Reload" location when you are finished, or keep it for future use.

2. This is the language for Mac OS X 10.2 or later. For versions 10.1 to 10.1.5, you would choose "Active Network Ports". For versions 10.0 to 10.0.4, you would choose "Advanced" from the "Configure" menu.

3. If the Manual configuration does not work, go back to step 12, and replace it with this action: Choose Using DHCP from the Configure pop-up menu. If this method allows you to connect to the base station, you may have triggered a soft reset instead of a hard reset.

4. Some other Apple documents may suggest an IP Address of 192.42.249.15. Either may be used, or any other 192.42.249.x address that is not held by the router. For related background information on configuration via DHCP, see AirPort 2.0.4: About Using Link-Local Addressing.

5. Depending on how you had your base station configured, your original network settings may not connect to the base station. If necessary, change your TCP/IP setting to Configure via DHCP, which will connect to the base station in its default state (see Note 6). To avoid disturbing your original network settings, you may choose to create a new location as you did in Step 5. A suggested name for this location is "AirPort Default".

6. If your computer is already set to configure via DHCP, which it probably is after following these steps, it may hold the previously-obtained IP address longer than you expect. The previously-obtained address may no longer be valid, preventing you from connecting. In this case there are different ways to prompt the computer to immediately obtain a new IP address, and this one is the fastest: Change the Location menu to a different location. Click Apply Now. Change the Location menu back to the one you are using. Click Apply Now.

7. Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see AirPort: Requirements for Wireless Internet Access.

Mac OS X: How to select an LPR printer in Classic

When choosing a printer or switching between printers in Classic, it may appear that there is not a Chooser selection available for an LPR printer.
This article has been archived and is no longer updated by Apple.
This fix assumes you have set up an LPR printer before. If you have not, use the Desktop Printer Utility to add an LPR printer. It is located in the Utilities folder inside the "Applications (Mac OS 9)" folder.

Steps to select an LPR printer in Classic:

1. From a Classic application, choose Chooser from the Apple menu.
2. Click the LaserWriter icon. A list of AppleTalk devices appears, which you should ignore.
3. Close the Chooser. When you print from Classic, you are now able to choose the LPR based printer in the print dialog.

Tip: If the job doesn't print as expected, try printing it in the foreground. Choose Background Printing from the Print window's preferences pop-up menu, then select Print In: Foreground.

Mac OS X: Power Mac G4, Slow Performance After Sleep

When you wake the computer from sleep applications will not open. The system does not respond ("freeze").
This article has been archived and is no longer updated by Apple.

Symptom

System performance decreases after sleep. This may only occur after the Eject key is pressed after waking from sleep.

Solution

Update the CD-RW drive's firmware. See technical document 120029: "**Power Macintosh G4 CD-RW Firmware Update: Information and Download**"
Published Date: Feb 17, 2012

Startup Manager: Only Displays Mac OS 9, Not Mac OS X

You have both Mac OS X and Mac OS 9 installed on the same volume, but only one appears in Startup Manager.
This article has been archived and is no longer updated by Apple.

Symptom

You have both Mac OS X and Mac OS 9 installed on the same volume. You press and hold the Option key during startup, but only Mac OS 9 appears in Startup Manager.

Note: All Apple computers (other than servers) come in this default configuration.

Solution

You may use the X key during startup to force the selection of Mac OS X. Follow these steps:

1. If the computer is shut down, press the power button. If it is on, restart it.
2. Immediately press and hold the X key. The computer starts up to a gray screen, then restarts again.
3. Release the X key after the computer restarts.

The computer starts up from Mac OS X. The Startup Disk setting is now changed to start up in Mac OS X. This differs from using Startup Manager, which does not save the preference change.

For more information, see technical documents:

106696: "**Mac OS: Press X Key During Startup to Select Mac OS X on Single-Partition Installations**"
106698: "**Startup Manager: Only Displays Mac OS X, Not Mac OS 9**"
106178: "**Startup Manager: How to Select a Startup Volume**"
Published Date: Feb 17, 2012

Startup Manager: Only Displays Mac OS X, Not Mac OS 9

Your computer can start from Mac OS 9 or Mac OS X, you have both Mac OS X and Mac OS 9 installed on the same volume, but only one appears in Startup Manager.
This article has been archived and is no longer updated by Apple.

Symptom

You have both Mac OS X and Mac OS 9 installed on the same volume of a computer that can start from either. You press and hold the Option key during startup, but only Mac OS X appears in Startup Manager.

Note: All Apple computers (other than servers) come in this default configuration.

Solution

After starting up into Mac OS X, follow these steps:

1. Choose System Preferences from the Apple Menu.
2. Click Startup Disk.
3. Click the Mac OS 9 System Folder.
4. Click Restart, then Save and Restart when prompted to save your change.

If you are troubleshooting Mac OS X and cannot use System Preferences to select Mac OS 9, then start the computer up from a Mac OS 9.1 or later CD-ROM disc. Follow these steps:

- Insert the Mac OS 9.x CD into the disc drive, then restart the computer.
- Press and hold the C key.
- After the computer starts up from Mac OS 9, choose Control Panels from the Apple menu.
- Open the Startup Disk control panel.
- Choose Mac OS 9. Be sure to choose the hard disk icon, and not the CD icon.
- Restart the computer.

For more information, see technical documents:

106178: "**Startup Manager: How to Select a Startup Volume**"
106696: "**Mac OS: Press X Key During Startup to Select Mac OS X on Single-Partition Installations**"
106697: "**Startup Manager: Only Displays Mac OS 9, Not Mac OS X**
Published Date: Oct 7, 2016

Mac OS X 10.1: Language Updates for Mac OS X

Language updates allow you to add more languages to Mac OS X.
This article has been archived and is no longer updated by Apple.
Mac OS X is a multilingual operating system. You may use languages other than the one you selected during installation. Language updates install additional fonts and resources that allow more language choices to appear in the International pane of the System Preferences application. The "Available Updates" section below lists the languages that are available. You may also download combination installers that group the individual languages by region.

The language updates work with Mac OS X 10.1.5. If you do use a version of Mac OS X prior to 10.1.5, see technical document 106888: "**Mac OS X Update 10.1.5: Enhancements and 'Before You Install' Information**"

Note: If you have previously installed a Mac OS X Language Update before updating to Mac OS X version 10.1.5, you do not need to reinstall the language update(s)

After you have updated to Mac OS X 10.1.5, you can install language updates. Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Software Update from the View menu.
3. Click Update Now.

You should see language updates. After installing the software, you can add to the Languages list. To do that, follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose International from the View menu.
3. Click Edit.
4. Select the new languages that you wish to appear in the list.
5. Click OK.

Available updates

Via Automatic Software Update

- Swedish Language Support
- Danish Language Support
- Finnish Language Support
- Norwegian Language Support
- Brazilian Portuguese Language Support
- Korean Language Support
- Simplified Chinese Language Support
- Traditional Chinese Language Support

Via Apple Software Downloads

You may download standalone installers from Apple Software Downloads (http://www.apple.com/swupdates/).

- Roman Language Updates
  This combined installer adds fonts and resources needed to use Mac OS X in Swedish, Danish, Finnish, Norwegian, and Brazilian Portuguese, in addition to any other language currently installed.
- Asian Language Updates
  This combined installer adds fonts and resources needed to use Mac OS X in Simplified Chinese, Traditional Chinese, and Korean, in addition to any other language currently installed.

Mac OS X: How to Automatically Start up Classic at Login

You may set the Classic environment to automatically start up after you log in. This is set in the Classic pane of System Preferences.
This article has been archived and is no longer updated by Apple.
If you want the Classic environment to open automatically after you log in to Mac OS X, you can choose that behavior in the Classic pane of the System Preferences application. Follow these steps to enable or disable the feature:

1. Choose System Preferences from the Apple menu.
2. Choose Classic from the View menu.
3. If necessary, click the Start/Stop tab.
4. Select or deselect the checkbox for "Start up Classic on login to this computer," whichever you desire.

If you want to set up other login/startup features or items, see technical document 106703: "**Mac OS X: Startup/Login Options and Features**"
Published Date: Feb 17, 2012

Mac OS X: Startup/Login Options and Features

You may enable or invoke several useful Mac OS X features during the startup and login sequences. They may be used to change the way you log in, open items when you log in, update your software, or perform other tasks.
This article has been archived and is no longer updated by Apple.
The following items may be referred to as "startup" or "login" features. A "startup" feature is one that occurs while the computer is starting up, but before you log in. A "login" item or feature is one that occurs immediately after you log in to Mac OS X with your user name and password. These features are available:

Automatic login

You may set up Mac OS X to automatically log in a particular user after startup. See technical document 106164: "**Mac OS X 10.0: How to Log In Automatically at System Startup Time**"

Log in by list or by text entry

The Mac OS X login window allows you to log in by choosing your name from a list of the computer's users, which includes pictures in Mac OS X 10.1 and later. Alternatively, you may choose to type your name and password instead of displaying a list. See technical document 61337: "**Mac OS X: How to Set up a Login List**"

Hide/Suppress previous user's login name

When logging in by text entry, Mac OS X displays the name of the last user that logged in. You may turn off this feature by following the steps in technical document 106691: "**Mac OS X 10.1.2: How to Prevent Prior User Name from Appearing During Login**"

Login items

To set up login items, see technical document 106146: "**Mac OS X: How to Set up Login Items**"

Automatic Classic startup

You may set up Classic to start up automatically after you log in. See technical document 106701: "**Mac OS X: Automatic Classic Startup**"

Changing the startup volume

You can change your startup volume at system startup time. See technical document 106178: "**Startup Manager: How to Select a Startup Volume** "

Software Update

Software Update may periodically open after you log in to your computer. If so, it is set to automatically check for updates. You can set this up in the Software Update pane of System Preferences. See technical document 106704: "**Mac OS X: How to Update Your Software**"

Note: This list covers common startup/login item and features. It is not an exhaustive description of what Mac OS X could be configured to do during the startup and login sequences.
Published Date: Feb 17, 2012

Mac OS X: How to Change the Default Printer

You may change the Mac OS X default printer by following the steps listed in this document.
This article has been archived and is no longer updated by Apple.
When more than one printer is available, you can specify which printer should be the default in the print dialog. Unless you choose otherwise, Mac OS X defaults to the printer most recently added. To change the default printer, follow these steps:

1. From the print dialog, choose Edit Printer List from the Printer pop-up menu.
2. Select a printer from the Printer List.
3. Choose Make Default from the Printers menu.

In the Printer List window, a gray dot marks the default printer.
Published Date: Oct 7, 2016

Mac OS X: How to Choose a PPD File for a PostScript Printer

PostScript printers may use PPD files to access special printer features. Mac OS X often chooses the PPD automatically. This document describes how you may choose a PPD.
This article has been archived and is no longer updated by Apple.
Note: This document covers one aspect of printing in Mac OS X. For more information, see technical document 106706: "**Mac OS X: How to Print**"

Choosing a PPD file

PostScript printers may use PPD files to give you access to special printer features. Mac OS X assigns a PPD file to a USB or AppleTalk printer automatically when you add the printer. You manually select a PPD file when adding an LPR printer to the printer list. Even if a PPD file is not found for a given LPR printer, Mac OS X can still print to it. Choose the Generic PPD or one for a printer model similar to yours. Choosing a similar model often provides access to more of your printer's capabilities the Generic PPD does, which is designed for maximum compatibility with a wide range of printers. For more details, see technical document 106516: "**Mac OS X 10.1: Includes PPDs for Many PostScript Printers**"

Changing a printer's PPD file

To associate a different PPD file with a printer, whether network or USB, follow these steps:

1. From the Print dialog, choose Edit Printer List from the Printer pop-up menu.
2. Select the printer, then click Delete.
3. Add the printer again, selecting the specific PPD you wish to use from the Printer Model pop-up menu.

To see which PPD a printer is using

To find out which PPD file a printer is using, follow these steps:

1. Open an application, such as TextEdit.
2. Choose Print from the File menu.
3. Choose the printer from the Printer pop-up menu.
4. Choose Summary from the pop-up menu that does not have a name to its left.

Published Date: Oct 8, 2016

Mac OS X 10.1: Chart of Available Software Updates

This article has been archived and is no longer updated by Apple.

This chart lists updates available for Mac OS X 10.1, or software that requires Mac OS X 10.1 or later, such as iPhoto 1.0.

Software Updates for Mac OS X 10.1

Update Name and Download	Prerequisite Software Install in Order Listed	Release Date	Information	Notes
Mac OS 9.2.2 Update (for Classic Environment)	◦ Mac OS 9.2.1	2001-12-05		3
Security Update 2004-01-26 (10.1.5 Client and Server)	◦ Mac OS X 10.1.5	2004-01-26		1
Security Update 7-18-02 for v10.1	◦ Mac OS X 10.1	2002-07-18		1, 8
Mac OS X Update 10.1.5	◦ Mac OS X 10.1 ◦ Security Update 7-18-02	2002-06-05		1, 4, 7
Security Update 7-18-02	◦ Mac OS X 10.1.5	2002-07-18		1, 8
Language Support Updates for Mac OS X 10.1.5	◦ Mac OS X 10.1 ◦ Mac OS X Update 10.1.5 ◦ Security Update 7-18-02	2002-06-05		1, 7
Networking Update 1.0	◦ Mac OS X 10.1.5	2002-06-21		1

Upgrading to a later version of Mac OS X

For information about upgrading, see technical document **106953**.

For information about Mac OS X 10.2 updates, see technical document 75421, "**Mac OS X 10.2: Chart of Available Mac OS Software Updates**".

Mac OS X Application Updates				
Update Name and Download	**Prerequisite Software Install in Order Listed**	**Release Date**	**Information**	**Notes**
AirPort 2.0.4 for Mac OS X	◦ Mac OS X 10.1.5 ◦ Networking Update 1.0	2002-06-24		2

Apple DVD Player 3.0.1 for Mac OS X	• Mac OS X 10.1 • Security Update 7-18-02 • Mac OS X Update 10.1.1 or later	2001-11-29		6
iPhoto 1.1.1	• Mac OS X 10.1 • Security Update 7-18-02 • Mac OS X Update 10.1.2 or later	2002-01-07		2
iTunes 2.0.4 for Mac OS X	• Mac OS X 10.1 • Security Update 7-18-02 • Mac OS X Update 10.1.1 or later	2001-12-13		2

Internet Explorer 5.1 Security Update (5.1.4)	• Mac OS X 10.1	2002-04		2, 5
iPod Software 1.1	• Mac OS X 10.1 • Security Update 7-18-02 • Mac OS X Update 10.1.2 or later	2002-03-20		N/A
Java 1.3.1 Update 1	• Mac OS X 10.1 • Security Update 7-18-02 • Mac OS X Update 10.1.3 or later	2002-02-25		2, 7
Open Firmware Password 1.0.2	• Firmware 4.1.7 or later • Mac OS X 10.1	2001-12-20		N/A

Notes

1. To reinstall this update over a later version, you should backup important data, erase your Mac OS X volume, install Mac OS X 10.1, reinstall any prerequisite updates, and then this update. You may wish to back up the entire contents of your Home directory, which is the folder bearing your name in the Users folder.

2. You can reinstall this update without first erasing your Mac OS X volume. If you did not save the update after an Automatic Software Update, download the standalone installer from Apple Software Downloads (http://www.apple.com/swupdates/).

3. To reinstall this update, first start up from Mac OS 9. For instructions on how to do this, see technical document 106667: "**How to Switch Between Mac OS 9 and Mac OS X**"

4. This update replaces the Mac OS X 10.1.1, 10.1.2, 10.1.3, 10.1.4 Updates, and the Security Update April 2002..

5. Use the Software Update feature of System Preferences to install this update. It is not available as a stand-alone software download through Apple Software Downloads.

6. This software does not work with all Mac OS X-compatible computers. See the Information and Download link for this document.

7. Computers that shipped with Mac OS X version 10.1.3 do not require the listed Prerequisite Software before installing this update.

8. "Security Update 7-18-02 for v 10.1" is used with Mac OS X 10.1 only, and must be installed before any other Mac OS X update. "Security Update 7-18-02" is used with Mac OS X versions 10.1.1 through 10.1.5, and must be installed before any additional Mac OS X update.

Mac OS X: How to Install and Update Mac OS X

This document describes how to install Mac OS X, and update it to the latest software version.
This article has been archived and is no longer updated by Apple.

How to Install Mac OS X

These steps describe installation on a disk that does not contain Mac OS X. If you already have Mac OS X installed and want to update or reinstall it, skip this section.

1. Insert the Mac OS X Installation CD-ROM disc into the computer's disc drive.
2. Double-click the Install Mac OS X icon in the CD window. Your computer restarts automatically, and the Mac OS X Installer opens. You may then review the Read Me documentation and the Software License Agreement.
3. If you agree with the Software License Agreement, follow the on-screen prompts to complete the installation.
4. Restart your computer when the installation is complete.
5. Follow the prompts to complete Mac OS X Setup Assistant.

How to Update Mac OS X

1. Choose About This Mac from the Apple Menu to determine which version of Mac OS X you have installed.

Note: If your version is 10.0.4 or earlier, you must update to Mac OS X 10.1 before you can install the latest software. This requires a 10.1 update CD.

Once you know which version you have installed, you may update one of two ways, Automatic Software Update or by using standalone installers from Apple Software Downloads (http://www.apple.com/swupdates/).

Automatic Software Update

Automatic Software Update is available in the System Preferences application. For more information on how to use it, see technical document 106704: "**Mac OS X: How to Update Your Software**".

Manual update using standalone installer

You can download software updates from Apple Software Downloads (http://www.apple.com/swupdates/). Some updates must be installed in a specific sequence, which is described in technical document 106713: "**Mac OS X 10.1: Chart of Available Software Updates**".

How to Reinstall Mac OS X

You should not reinstall an earlier version of Mac OS X over a later version. For more information, see technical documents:

106605: "**Mac OS X 10.1: Do Not Reinstall After Using the Mac OS X Update 10.1.1, 10.1.2, 10.1.3, 10.1.4, or 10.1.5**".

106692 Mac OS X: Troubleshooting Installation and Software Updates

Published Date: Oct 8, 2016

Mac OS X: How to Use Mac OS 9 Applications

Mac OS X includes the Classic environment, which allows you to use most Mac OS 9 applications without restarting the computer.
This article has been archived and is no longer updated by Apple.
The Classic environment of Mac OS X allows you to use most Mac OS 9 applications. This means that most people only need to restart the computer from Mac OS 9 to install Mac OS 9 software updates. Mac OS 9-compatible applications are referred to as "Classic" applications.

Starting a Classic application

- Double-click the Classic application, just as you would any other. Classic starts up automatically.
- Clicking the disclosure triangle in the Classic startup window reveals the Mac OS 9 startup sequence.
- After Classic starts up, it remains active until you stop it or log out.
- Classic may be manually started or stopped in the Classic pane of System Preferences. Other Classic options are also located there.

Mac OS 9 installation required

- You must install Mac OS 9 before Classic can be used. The Mac OS 9 Installation CD-ROM disc is included with earlier versions of Mac OS X for this reason. It is also included with new computers, in addition to Mac OS X. Update Mac OS 9 to the latest version for best performance. For more information on Mac OS X 10.2 as a standalone retail product, see technical document 106966, "**Mac OS X 10.2: Classic Requires That You Already Have Mac OS 9**".
- If you have Mac OS 9 installed on more than one disk, use the Classic pane of System Preferences to select the System Folder that Classic uses.

Locating Classic software and documents

If you install Mac OS X on the same disk or partition as your Mac OS 9 system, your Classic applications and documents remain in the same folders. You should note, however, that Mac OS X and Mac OS 9 use different desktop folders. To see items from your Mac OS 9 desktop, use the "Desktop (Mac OS 9)" alias that is on your Mac OS X desktop. If this alias is not on your desktop or does not work, see technical document 106468: "**Mac OS X: How to Replace the Alias "Desktop (Mac OS 9)**".

Printing from Classic applications

See technical document 106710: "**Mac OS X: How to Print From a Classic Application**".

More information about Classic

See "Classic" on pages 14 and 15 of your "Welcome to Mac OS X" booklet.

You can find more information in Mac Help, or search for other technical documents using the phrase "Mac OS X and Classic".

Troubleshooting

See technical document 106677: "**Mac OS X: Troubleshooting the Classic Environment**".
Published Date: Oct 8, 2016

Mac OS X: Use Disk Utility If CD Burn Is Interrupted

If a disc burn is interrupted, Disk Utility allows you to recover disk space that was reserved for temporary files.
This article has been archived and is no longer updated by Apple.
Mac OS X reserves an amount of hard disk space when burning a CD. The amount of space reserved depends on the size of the CD. If a disc burning operation is unexpectedly interrupted, this space may be temporarily unavailable. The system is not otherwise adversely affected. Interruption could occur, for example, if the computer loses power, is force restarted, or an external CD burner is disconnected during use.

For Mac OS 10.2 or later

To make the temporary space available again, restart the computer. It is not necessary to use Disk Utility or fsck.

For Mac OS X 10.0 to 10.1.5

To make the temporary space available, either use Disk Utility to repair the disk or burn another CD successfully.

Steps for using Disk Utility:

Insert your Mac OS X CD-ROM disc, then restart the computer while holding the C key.

1. Once started up from CD, choose Disk Utility from the Installer menu.
Important: Do not click Continue in the first screen of the Installer. If you do, you must restart from CD to access Disk Utility.
2. Click the First Aid tab.
3. Click the disclosure triangle to the left of the hard drive icon to display the names of your hard disk volumes and partitions.
4. Select your Mac OS X volume.
5. Click Repair. Disk Utility checks the disk.

Once complete, quit Disk Utility and restart from your Mac OS X volume.

Advanced: Using fsck

If your Mac OS X CD or your CD drive is not available, use fsck twice instead of Disk Utility.

Use fsck two times. See technical document 106214: "**Mac OS X: Why, When, and How to Run fsck for File System Maintenance**".
Published Date: Feb 17, 2012

Mac OS X: Classic Game Slows or Stops Responding When Changing Video Resolution or Color Depth

Certain 3D-accelerated Classic games, including Rune and Madden NFL 2000, may appear to stop responding if a high video resolution or color depth is selected from within the game's preference screen.
This article has been archived and is no longer updated by Apple.

Symptom

After selecting a higher video resolution or color depth within a 3D-accelerated (OpenGL) Classic game, the game may seem to stop responding (the game actually is still working, but not responding as rapidly).

Certain 3D-accelerated Classic games, including:

- Madden NFL 2000 (published by Aspyr)
- Rune (published by Westlake Interactive)

Solution

Use a lower video resolution (such as 800- by 600-pixels) and/or lower color depth (such as 16-bit, "thousands of colors").

If you are not sure how to change the game's settings back, refer to documentation that came with the software, or contact the publisher for assistance.

The more VRAM that is available on your graphics card, the higher the video resolution and color depth settings you can use.

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

The following document can help you search for a particular vendor's address and phone number:

Document 17159: "**Locating Vendor Information**"

Published Date: Feb 17, 2012

Mac OS X 10.1.5 or Earlier: Installing Mac OS 9 in Classic May Leave Temporary Items

If Mac OS X File Sharing is turned on when you install Mac OS 9.1 or Mac OS 9.2 from within Classic, 200 MB of temporary items used by the Installer may be left behind after the installation has completed. These items do not affect the installation and can be deleted normally.

This article has been archived and is no longer updated by Apple.

Symptom

When installing Mac OS 9.1 or Mac OS 9.2 from within Classic, some disk image file systems may remain on your Mac OS X desktop. When this occurs, several Installer Temp folders may also be left in the folder called "System Folder" on the volume where you installed Mac OS 9.

Note: This does not affect Mac OS X 10.2 or later, because File Sharing in Classic is no longer supported.

Solution

These symptoms will not occur if you turn off Mac OS X File Sharing in the Sharing pane of System Preferences before installing Mac OS 9.

If these items are left after installation, follow these steps:

1. Click the disk image icons in the Finder to select them.
2. Choose Eject from the Finder application menu.
3. Locate any folders within the Mac OS 9 System Folder with names that contain "Installer Temp" and drag them to the Trash.
4. Empty the Trash.

Mac OS X: PPP Terminal Window Is Blank When Connecting

This document explains what to do when you connect to a PPP server that requires you to log in via a terminal window, and the expected login prompt does not appear in the window.
This article has been archived and is no longer updated by Apple.

Symptom

Some PPP servers require you connect via a terminal window when establishing the dial-up connection. In this case, you must select "Connect using a terminal window (command line)" in the PPP Options pane of System Preferences. In some cases, the terminal window may appear blank instead of showing the expected login prompt when you connect from a Mac OS X client.

Solution

This is resolved in Mac OS X 10.2 or later. For earlier versions, press the Return key when the blank terminal window appears. The login prompt appears, and you can continue the login process normally.

Mac OS X: Disk Image File Cannot Be Deleted While the Image Is Available

A disk image file cannot be deleted while the related disk image appears on the desktop or is otherwise available..
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears when you try to delete a disk image file:

> "This operation cannot be completed because the item <name of disk image file> is in use."

Solution

This is a normal behavior. You only need to quit using files stored on the disk image to be able to delete it. You make a disk image appear on the desktop or otherwise become available by double-clicking a ".img" file. This is sometimes called a "mounted" disk image. Though a disk image is not actually a disk, it behaves as one. Follow these steps to put it way or "unmount" it:

1. Find the related disk image on the desktop or in the Finder. It has the same name as the item you are unable to delete, but without the ".img" or ".dmg" filename suffix. It has a disk icon, and it appears in the Computer list in the Finder window.
2. Select the disk image that appears on the desktop.
3. Choose Eject from the File menu, or drag it to the Trash. If the symptom message appears again, close any files or applications that you opened from the disk image. If you cannot determine which are in use, quit all running applications or restart the computer.

For more information on disk images, see technical document 106161: "**Mac OS X: About Using Disk Copy Images**".

Mac OS X: Cannot Install From ATA ID 1 (Slave) Disc Drive

A Mac OS X Installation disc does not work when using a disc drive that is set to ATA ID 1 (slave mode).
This article has been archived and is no longer updated by Apple.

Symptom

You cannot start up or install from the Mac OS X Install CD-ROM disc. A broken folder icon or an alert box with this message may appear:

> "An error occurred. Startup Disk was unable to select the install CD as the startup disk. (-2)"

Note: This does not affect USB-, SCSI-, or FireWire-based disc drives. Apple-installed ATA drives are factory-configured with ATA ID 0.

Solution

"Disc drive" refers to CD, CD-R, CD-RW, DVD, DVD-RAM, DVD-R, Combo drives, SuperDrives. Determine the ATA ID of your disc drive using Apple System Profiler.

1. Open the Apple System Profiler.
2. Click the Devices and Volumes tab.
3. Note the "ID=" information that is associated with your disc drive.

If you do not have access to Apple System Profiler, you will need to visually check jumper settings on your disc drive.

If the ATA ID is 0

Stop here. This document does not apply to you. See technical documents:

88152: "**Mac OS X: Stops Responding While Starting Up From Mac OS X CD**"
106694: "**Mac OS X: Troubleshooting the Mac OS X Installer**"

If the ATA ID is 1

Important: Resolving this issue requires opening your computer's case, physically removing the disc drive, moving one or two small jumpers on the drive, and putting the drive back in your computer. Instructions may have been included with your drive (if it was purchased separately from a third-party company) or appear in the materials which came with your computer.

The drive's ATA ID should be changed to ID 0 (master). Any other ATA device on the bus should need to be set to ATA ID 1. This is usually accomplished by adjusting jumpers on the back of the drive. Specific jumper setting information may be available from the manufacturer of the drive, or printed on the drive itself. If you use a third-party CD drive instead of the original Apple drive, you should also verify product compatibility with the manufacturer. If you need detailed assistance with changing the ID to 0 on a third-party device, refer to the manufacturer of the drive or their Web site.

Note: You should not change your Apple-installed disc drive to ATA ID 1 (slave mode) when adding other ATA devices.

Mac OS X Server: Lookupd "truncating list at maximum 1024 values" Message

If a Mac OS X Server process accesses group information, and that group contains more than 1024 members, a message appears in the console and system.log. The message is harmless and can be ignored.
This article has been archived and is no longer updated by Apple.

Symptom

The following message can appear in the console or system.log:

<time> {host} lookupd[pid]: truncating list at "{host}" (maximum 1024 of {#} values) <time> {host} last message repeated # times

Key:

1. **<time>** is the time that the message was logged in the console and system.log. {host} is the name of the computer on which the issue occurred or the user record that was passed to lookupd that initiated the query.
2. **pid** is the process ID of lookupd, the process that caused the message.
3. **{#}** is the total number of users in the group that lookupd is accessing.
4. # is the number of times the message is repeated as lookupd accesses the group.

Solution

This message is harmless. It does not reflect an actual limitation in the number of users that may be the member of a group in Mac OS X Server or Mac OS X.

These messages can occur on Mac OS X Server computers that have over 1024 local users as members of a single group. It can also occur when the Mac OS X computer has Directory Services set up to bind to a directory that contains more than 1024 users. You can safely ignore these messages. For more information on lookupd, see technical document 30770, "**Mac OS X: What is Lookupd?**"
Published Date: Feb 20, 2012

Mac OS X Server: How to Remotely Determine Which Version Is Installed

You may use the Server Admin or Terminal application to remotely determine the version of Mac OS X Server.
This article has been archived and is no longer updated by Apple.

Using Server Admin

1. Open Server Admin and log on to the Server.
2. Click the General tab.
3. Choose Show Server Info from the Server Info module.

The Server Admin can be found in /Applications/Utilities/ folder. The Mac OS X Server CD-ROM also includes the "Admin-Install.mpkg" file that you can use to install Server Admin application on a Mac OS X 10.1 client computer. It can be found on the CD in this location:

/Mac OS X Server/Welcome to Mac OS X Server/Admin Install/Admin_Install.mpkg

Using the Terminal

Experienced administrators may determine the version of Mac OS X Server by using the uname command with an "a" flag (uname -a) via a remote Terminal session.

This command works with Mac OS X Server, but will only output system information that relates to the UNIX-based foundation of Mac OS X Server, known as Darwin. For example, it can provide the following output:

[macosxserver:~] admin% uname -a Darwin macosxserver.domainname.com 5.2 Darwin Kernel Version 5.2: Fri Dec 7 21:39:35 PST 2001; root:xnu/xnu-201.14.obj~1/RELEASE_PPC Power Macintosh powerpc

To determine the version of Mac OS X Server via a remote terminal session, use the sw_vers command. For example, sw_vers can provide the following output:

[macosxserver:~] admin% sw_vers ProductName: Mac OS X Server ProductVersion: 10.1.2 Server BuildVersion: 5P68
Published Date: Feb 17, 2012

Mac OS X Mail: Spell Checker Available for English Only

Prior to Mac OS X 10.2, spell checking in the application Mail is only available for the English language.
This article has been archived and is no longer updated by Apple.

Symptom

1. Spell checking in the application Mail does not recognize non-English words.

2. When you choose Spelling from the Edit menu in Mail, you only find the English dictionary.

Solution

Spell checker is available in additional languages in Mac OS X 10.2 and later.
Published Date: Feb 17, 2012

Mac OS X: How to Add or Remove Classic Fonts

If you add fonts in the Classic System Folder, you must restart the Classic environment in order for the new fonts to be available to Classic applications. If want to remove fonts from the Classic System Folder, you must first shut down the Classic environment.
This article has been archived and is no longer updated by Apple.

Adding fonts

Mac OS X 10.0 through 10.2.8:

1. Stop the Classic environment (refer to "How to stop or restart Classic" below).
2. Add the font file(s) to the Mac OS 9 System Folder's Fonts folder. If you do not know which Mac OS 9 System Folder is used by Classic, check the Classic preference pane.
3. Start Classic or open a Classic application. The added font files should now be available.

Mac OS X 10.3 or later:

1. Quit any running Classic applications that you want the new fonts to appear in, or stop Classic using Classic preferences.
2. Open Font Book, which is in the Applications folder.
3. Click the triangle next to All Fonts.
4. Drag the fonts you're adding onto "Classic Mac OS".
5. Open the desired Classic application(s).

Removing fonts

Mac OS X 10.0 through 10.2.8:

1. Stop the Classic environment (refer to "How to stop or restart Classic" below).
2. Remove the font file(s) from the Fonts folder within the Mac OS 9 System Folder. If you do not know which Mac OS 9 System Folder is used by Classic, check the Classic preference pane.
3. Start Classic or open a Classic application. The removed font files should no longer be available.

Mac OS X 10.3 or later:

1. Open Font Book, which is in the Applications folder.
2. Click the triangle next to All Fonts.
3. Select "Classic Mac OS" in the Collection column.

   Important: "Classic Mac OS" fonts differ from "Classic" fonts. Removing or disabling a "Classic" font doesn't affect the Classic environment.

4. Select the font to be removed in the Fonts column.
5. From the File menu, choose Remove Font.
6. Restart Classic using Classic preferences.

Note: Removing fonts with Font Book moves the font file into the Trash. Empty the Trash to delete the file.

How to stop or restart Classic

1. Choose Apple menu > System Preferences.
2. Choose View > Classic.
3. Click the Stop or Restart button, as desired.

Published Date: Oct 8, 2016

Mac OS X Mail: About CRAM-MD5 Encryption

In Mac OS X 10.1.2 and later, Mac OS X Mail can use CRAM-MD5 encryption to communicate with SMTP and IMAP servers.
This article has been archived and is no longer updated by Apple.
CRAM-MD5 is a method of encryption that can be used by Mail when logging in to SMTP and IMAP servers in Mac OS X 10.1.2 and later. CRAM-MD5 is used by default to encrypt your password when sending mail using an SMTP server or checking mail on an IMAP server. If the server does not have a CRAM-MD5 encrypted authentication feature, Mail reverts to sending your password in clear text.

Note: In rare cases, Mail may not communicate with a server that responds unexpectedly to CRAM-MD5 encrypted authentication. In this case, Mail will generate a message that can be viewed in the Console application. The message has this format:

> date&time Mail [process id] CRAM-MD5 authentication failed for <SMTP or IMAP> account username@server

In this case, CRAM-MD5 authentication may be manually disabled by following these steps:

1. Open the Terminal application.
2. Type this line exactly:

```
defaults write com.apple.mail DisableMD5Authentication YES
```

3. Press Return.

To re-enable CRAM-MD5 authentication, follow the above directions, but type the command:

```
defaults write com.apple.mail DisableMD5Authentication NO
```

Published Date: Feb 17, 2012

Mac OS X 10.1, 10.2: Help Does Not Open, "any ‘scgaijieditor001‘ s were not found" Alert

Help may not appear in the TrueType Font Editor, Chinese Text Converter, or IM Plugin Converter. These applications are found in the Asia Text Extras folder included with language support updates to Mac OS X 10.1 and 10.2.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to open Help within these applications, an alert box with this message may appear:

> "any 'scgaijieditor001' s were not found."

Solution

The Asia Text Extras folder is found at /Applications/Utilities/ after installing language support updates for Mac OS X. This folder includes the TrueType Font Editor, Chinese Text Converter, and IM Plugin Converter. If you select Japanese during installation or set it as the system language in the International pane of System Preferences, Help may not appear for these three applications.

1. Choose System Preferences from the Apple menu.
2. Choose International from the View menu.
3. Click the Keyboard Menu tab.
4. Select Simplified Chinese from the Keyboard list.
5. The Keyboard menu now appears in the menu bar as the symbol of the selected keyboard, which is often a flag.
6. Using the keyboard menu, switch from Kotoeri to Simplified Chinese.

After performing these steps, Help works with the affected applications, even if you switch back to Kotoeri or deselect Simplified Chinese in the Keyboard Menu pane of System Preferences.

Note: Help information for Asia Text Extras will appear in Chinese.
Published Date: Oct 10, 2016

Macintosh Manager 2.1.1: A Qualified DNS Record May Help Macintosh Manager

If your watchdog log shows that the Macintosh Manager process is "Respawning," you should set up a fully qualified DNS record for the Macintosh Manager server.
This article has been archived and is no longer updated by Apple.

Symptom

1. Macintosh Manager clients take longer to log in than expected.

2. The Watchdog log on the server notes "respawning" of the Macintosh Manager Server process. You can examine the log by using the Log Viewer feature of the Server Admin application. (Figure 1).

Figure 1 Using Server Admin to view logs

Solution

Use the Network Utility (/Applications/Utilities/) to determine if the server's IP address has a fully qualified DNS entry. You should verify both forward and reverse lookups. Follow these steps:

1. Open the Network Utility.
2. Click the Lookup tab.
3. Deselect the checkbox for "Use 'dig' in place of 'nslookup'".
4. Type the server's DNS name (such as myserver.apple.com) in the text entry field.
5. Click Lookup. Is the server's correct IP address returned?

Figure 2 Looking up the Knowledge Base

6. Type the server's IP address (such as 192.169.1.100) in the text entry field.
7. Click Lookup. Is the server's correct DNS name returned?

If one or both of the DNS lookups fails to produce the correct result, contact your network administrator. Request that a fully qualified DNS record be created for your server's name and IP address, for both forward and reverse lookup.

If Macintosh Manager login still seems slow, see technical document 106454, "**Macintosh Manager 2.0: Common Setup Strategies**".
Published Date: Feb 17, 2012

Mac OS X Update 10.1.3: Enhancements and "Before You Install" Information

Mac OS X Update 10.1.3 addresses certain issues and updates system software.

This article has been archived and is no longer updated by Apple.

This software has been replaced by a later update. Because later updates include previous enhancements, the following information is still provided for reference. To find current software, see technical document 106713, "**Mac OS X 10.1: Chart of Available Software Updates**".

Enhancements Delivered with the Mac OS X 10.1.3 Update

In addition to enhancements previously delivered with Mac OS X 10.1.1 and 10.1.2, the Mac OS X 10.1.3 update includes the following:

Device Compatibility Enhancements

- Resolves an issue with USB PCI cards that do not work with sleep mode.
- Image Capture continues to recognize a Canon PowerShot camera connected to a USB port when a user logs out and back in.
- Kodak digital cameras with external SD memory (that contains image data) no longer display duplicate images in Image Capture.
- Works with USB Device Firmware Update.
- Improves USB PC Card memory usage.
- Improves compatibility with various SCSI-based CD-R drives.
- Improves compatibility with various SCSI-based scanners.
- Enhances robustness when using certain third-party CD drives that may not provide expected TOC size information.
- Improves compatibility with Microtech CompactFlash and SmartMedia readers.
- Adds or extends compatibility with many FireWire- and USB-based CD burners including: Que Fire! 24x10x40, EZQuest BOA CDR/W 24X10X40, LaCie 16x10x40 U-RW (FireWire connection) and CDRW 24-10-40 U & I (FireWire connection), Yamaha CRW3200IX-VK and CRW3200FXZ, MCE Technologies, Xcarét Pro (2000) 8x8x24x Expansion Bay CDRW Drive, Sony CDRW D-i1210J/1394, and I-O Data CDRW-i16J/US2.

Networking, Mail, and Internet Connectivity Enhancements

- The Login window can authenticate using Directory Services.
- Screen Saver can authenticate using Directory Services.
- More reliable LDAP compatibility when communicating with Active Directory.
- Mail has an SSL and encrypted IMAP (SIMAP) feature.
- Works with simultaneous active and passive modem port connections; software that receives incoming calls (such as FaxSTF) works better with software that places outgoing calls (such as Internet Connect).
- Improves WebDAV file service robustness, for example: when simultaneously copying and browsing files or folders on your iDisk.
- An issue (alert message "-50") when copying files whose name contains a comma to an iDisk via WebDAV has been addressed.
- Addresses a rare kernel panic that may have occurred during very heavy AppleTalk network traffic.
- Incomplete, unusable downloaded files are deleted when expected.
- Addresses a potential issue in which some deleted Mail messages may have been visible after compacting a mailbox.
- A later version of OpenSSH is included (version 3.0.2p1).
- Includes other general URL Access enhancements. (URL Access is a Mac OS X component that many applications use to provide Internet access features.)
- Includes URL Access scripting enhancements.

Other Enhancements

- Automatic login items may now be disabled temporarily. See technical document 106756, "**Mac OS X: How to Prevent Login Items From Opening Automatically**".
- Improves reliability when force quitting Classic applications individually.
- Reduces likelihood of a potential issue in which the system clock unexpectedly changes to 1969 (or 1970) during startup.
- Resolves a potential issue in which sound may mute unexpectedly when using the optional IrDA menu.
- Enhances reliability of waking certain PowerBook computers from sleep if peripheral devices are disconnected while the computer is in sleep.
- Improves compatibility with certain kinds of audio CDs (pre-gap-audio-track and pre-gap-data-track CDs).
- Improves compatibility with 80 mm CD-R discs used by Sony MVC-CD digital cameras.
- Addresses a rare issue in which the mouse pointer may not appear after exiting iTunes full screen visuals.
- Improves robustness of 3D-accelerated games on certain PowerBook computers, when video mirroring is turned on.
- Includes graphics drivers and display management software; improves display mirroring feature.
- Includes other general CD burning-related enhancements.

- Includes general iTunes enhancements.
- Addresses other potential kernel panic situations.

Published Date: Oct 10, 2016

Mac OS X: Loss of Sound After Waking From Sleep

After installing or updating to Mac OS X 10.1.2, there may be no sound after your computer wakes from sleep.
This article has been archived and is no longer updated by Apple.

Symptom

Visual feedback indicates you have changed the volume when you press the volume keys on the keyboard, but you do not hear any sound. Applications that should produce sound do not.

Solution

You may address the issue by updating to Mac OS X 10.1.5 or later.
Published Date: Oct 10, 2016

AirPort Base Station: About the WAN and LAN Ports

The AirPort Base Station (Dual Ethernet) and the AirPort Extreme Base Station each have two Ethernet ports. The WAN port uplinks to your network, and the LAN port serves wired clients of the base station.
This article has been archived and is no longer updated by Apple.
The base station has two Ethernet ports, a LAN port and a WAN port . Generally speaking, the WAN port connects to the Internet, and the LAN port accommodates wired Ethernet computers. Both ports share these features:

- They accept standard RJ-45 Ethernet connectors.
- They are designed not to allow accidental insertion of an RJ-11 telephone connector.
- A crossover cable is compatible but not required, since the base station automatically senses the cable type and adjusts the pinout signal accordingly.

The WAN port

Figure 1 The WAN port icon

Use the WAN port for connecting to digital subscriber line (DSL), a cable modem, or a wide area network (WAN), such as your existing school or business network. Contact your network administrator before placing a base station on a WAN.

The LAN port

Figure 2 The LAN port icon

Use the LAN port to connect wired Ethernet computers or printers to the base station. This allows them to communicate with wireless computers, to share an Internet connection, or both. You can connect a single computer or printer to the base station; or, for multiple devices, connect to the hub, switch, or router of a local area network (LAN). Since the base station itself is a router, a hub is adequate for a simple network.

Designing a network

For more information on designing a network, see these technical documents:

106658: "**Creating a Small Ethernet Network**."
120061: "**Designing AirPort Networks for Mac OS X (v10.1) Manuals**"
75138: "**Designing AirPort Networks for Mac OS 9 Document**"
Published Date: Oct 10, 2016

Mac OS 9: Unable to Install From CD in Mac OS X Retail Package

If your computer and your Mac OS X retail package both include the **same** version of Mac OS 9 (both 9.2.2 for example), then install using the CD-ROM disc that came with the computer.
This article has been archived and is no longer updated by Apple.

Symptom

1. The computer does not start up from the Mac OS 9 CD included with Mac OS X, and a flashing question mark appears during startup.

2. If you try to install Mac OS 9 while started up from the version of Mac OS 9 already installed on the startup disk, this message appears:

"This program cannot run on your computer. See the documentation for more information."

Note: This document is not relevant to you if your Mac OS X package came with a **later** version of Mac OS 9 than the disc included with your computer.

Solution

Install Mac OS 9 using the CD-ROM disc that came with the computer. Do not use the Mac OS 9 disc included in the Mac OS X box. Computer-specific resources may be included on the computer-bundled disc that are not present on the retail disc, despite the version number being the same. These resources are needed to start up from the CD or to install Mac OS 9 successfully on your computer.

Your choice of operating system language may also dictate that you use the disc included with your computer. For example: If you purchased your computer with the German version of Mac OS 9.1 but then while traveling purchased Mac OS X bundled with an English-localized Mac OS 9 disc, you could not use the English Mac OS 9 disc to update a previously-installed German version of Mac OS 9.

Additional troubleshooting

For related information, see these technical documents:

106294: "**Mac OS X: How to Reinstall Mac OS 9 or Recover From a Software Restore**"
106526: "**Mac OS 9.2.1: 'can not be installed over the localized version of Mac OS'**"
106244: "**Mac OS 9.1, Mac OS X 10.0: 'To install this software you must boot with the Mac OS CD' Message**"
Published Date: Feb 17, 2012

Mac OS X 10.1.3 Update: Changes to Display Settings

You may notice that some display settings have changed after you update to Mac OS X 10.1.3. This is normal.
This article has been archived and is no longer updated by Apple.

Symptom

After updating to Mac OS X 10.1.3, your display mirroring or extended desktop settings may have changed. Displays in extended desktop mode may revert to the default left-to-right layout. You may notice changes to display resolution, color depth, or refresh rate.

Solution

Mac OS X 10.1.3 includes changes to video device drivers that improve the reliability of computers using display mirroring. Due to these improvements, the system may not be able to retain the exact setting you had previously. You should restore your preferred settings using the Displays pane of the System Preferences application. Once you do this, your settings will be retained as expected.
Published Date: Feb 17, 2012

Mac OS X: How to Prevent Login Items From Opening Automatically

Mac OS X 10.1.3 introduces the ability to prevent login items from opening on a per-incident, or temporary, basis.
This article has been archived and is no longer updated by Apple.

How to disable login items per incident, or temporarily

Each time you log in, Mac OS X 10.1.3 or later allows you to choose whether or not your defined login items will open. If you log in normally, login items open. You may choose not to have them open by pressing the Shift key. Follow these steps to disable login items:

1. Start up the computer.
2. If Mac OS X is set to automatically login as a particular user, hold the Shift key during startup as soon as you see the blue background appear with a progress bar and "Mac OS X", then release the Shift key when the login window appears. See Note 1.
3. Login from the Login Window, then immediately hold the Shift key.
4. Release the Shift key after the desktop appears.

Notes:

1. Timing is important. Do not hold the Shift key before the blue screen, the progress bar, and "Mac OS X" appear. For Mac OS X 10.1.3, 10.1.4, or 10.1.5, if the computer is set to automatically login as a particular user, skip step 3 and hold the Shift key until step 4. For more on the automatic login feature, see **Mac OS X: Setting up Login, Startup items**.

2. Login items are those that you may set up to open automatically, immediately after logging in to the computer. For information on setup, see **Mac OS X: Setting up Login, Startup items**.

Published Date: Oct 10, 2016

Mac OS X: How to Change Desktop Icon Size and Arrangement

You can change the size and arrangement of icons on your desktop using the Show View Options command.
This article has been archived and is no longer updated by Apple.
Follow these steps:

1. Click the Finder icon in the Dock.
2. Choose Show View Options from the View menu. The Desktop window appears.
3. Use the slider and radio buttons to set the icon size and arrangement as desired.
4. Close the Desktop window.

Published Date: Feb 20, 2012

Mac OS X: How to Change Your Desktop Picture

You can change your desktop picture, or background, using the System Preferences application.
This article has been archived and is no longer updated by Apple.
You can change your desktop picture, or background, using the System Preferences application. Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Desktop from the View menu.
3. Choose a collection or folder from the Collection pop-up menu. Images contained in that collection or folder then appear in the selection pane below.
4. Click the picture you desire in the selection pane.
5. Quit System Preferences.

Note: The default setting for the Collection menu is Apple Background Images. The Pictures Folder menu selection refers to the Pictures folder in your Home directory. To use any other folder, use the Choose Folder menu selection. When you do, a navigation dialog appears as a sheet attached to the System Preferences window. Select the desired folder in the navigation dialog, then click Open.
Published Date: Feb 17, 2012

Mac OS X 10.3.9 or earlier: Unable to Burn CD or DVD (Alert Message -36)

This article has been archived and is no longer updated by Apple.

If insufficient hard disk space is available, an alert box with message "-36" may appear when you try to burn a CD or DVD.

This article applies to Mac OS X 10.3.9 or earlier.

Symptom

- An alert box with message "-36" appears when you burn a CD or DVD, and the burn does not complete.

Solution

When burning a CD or DVD, Mac OS X 10.3.9 and earlier reserves an amount of hard disk space that corresponds to the amount of data being burned to disc. To resolve the issue, make more disk space available on your Mac OS X volume. For example, you might back up large files that you do not use often, then delete them from your hard disk. For related information, see technical document 106721, "**Mac OS X: Use Disk Utility If CD Burn Is Interrupted**".

Published Date: Feb 17, 2012

Mac OS X Server 10.1: How to Set up SMTP Authentication

Mac OS X Server 10.1.3 or later offers an SMTP Authentication feature for the Apple Mail Server. Follow the steps in this document to set it up. This article has been archived and is no longer updated by Apple.
Note: This document describes versions 10.1.3 and 10.1.4. The procedure is different for versions 10.2 and later.

About SMTP AUTH

Important: Before proceeding, you should read technical document 106761: "**Mac OS X Server: About SMTP Authentication for Apple Mail Server**"

Steps to set up SMTP AUTH

The following procedure explains how to enable and configure SMTP Authentication, known as "SMTP AUTH," for Apple Mail Server by using the NetInfo Manager application.

Important: This document assumes a basic understanding of NetInfo Manager. If you are familiar with the Terminal, the niutil and kill commands, and process IDs, you may use those instead. See the "Advanced Administrators Only" section below.

1. If you have not already, update to version 10.1.4 and restart the server. See technical document 106704, "**Mac OS X: How to Update Your Software**".
2. Open the Server Admin application.
3. Be sure that MailServer is running.
4. Open NetInfo Manager (/Applications/Utilities/).
5. Navigate to the "config" directory in the local domain, located in the second column after "/".
6. Select the AppleMailServer directory in the next column. What you see should resemble Figure 1.

Figure 1 NetInfo Manager

7. Edit the "smtp_plain_login _flag" property by entering the value of "1". This enables SMTP AUTH. The table in Figure 2 summarizes the attributes of the Apple Mail Server for the SMTP AUTH feature.

Figure 2 Attributes of Apple Mail Server

8. Save the new settings and quit NetInfo Manager.
9. Stop and restart Apple Mail Server using Server Admin.

This completes the steps to configure the SMTP AUTH feature. If you need to change the setting, you can repeat this procedure

Client Settings

Email client applications work with SMTP authentication and are configured on a per user, per account basis. Figure 3 gives an example from the application Mail.

Figure 3 Setting up SMTP authentication in Mail

Advanced Administrators Only

You may configure SMTP AUTH in Apple Mail Server using the Terminal.

When the 10.1.3 Apple Mail Server starts up, it creates attributes in local NetInfo that control the behavior of the SMTP AUTH feature. You can edit these values with the niutil command. To view default settings, execute this command as root:

```
niutil -read . /config/AppleMailServer
```

The resulting output:

```
name: AppleMailServer
smtp_plain_login_flag: 0
open_relay_addr_flag: 0
open_relay_addr_list: 17.221.41.168
```

The IP address is the address of the server on which Apple Mail Server is running. You can enable the SMTP AUTH feature with the following command:

```
niutil -createprop . /config/AppleMailServer smtp_plain_login_flag 1
```

These NetInfo settings take effect when a HUP signal is received by the MailService process. To send the HUP signal:

```
kill -HUP `ps auxc | grep MailService | awk '{print $2}'`
```

Additional information

You can get more information from technical documents:

106762: "**Mac OS X Server 10.1: How to Set up Restricted SMTP Relay for Apple Mail Server**"
106763: "**Mac OS X Server: Restricted SMTP Relay Helps Prevent Unsolicited Email**"
Published Date: Oct 10, 2016

Mac OS X Server: About SMTP Authentication for Apple Mail Server

Mac OS X Server 10.1.3 or later offers an SMTP Authentication ("SMTP AUTH") feature for the Apple Mail Server. This allows you to accept SMTP traffic only from authenticated clients.
This article has been archived and is no longer updated by Apple.
SMTP AUTH allows an SMTP client to authenticate with a name and password when sending mail, thus allowing you to restrict who can send SMTP traffic to your server (whether for relay or local delivery). Points to remember:

- If SMTP AUTH is enabled but Restricted SMTP Relay is not, then all SMTP connections must authenticate before any mail will be accepted for either local delivery or relay.
  Important: Whenever SMTP AUTH is enabled, your email server is effectively "send only," because mail servers from other domains are most likely not configured to authenticate with your server. This means your local email clients can only receive email from other local clients.
- If both SMTP AUTH and Restricted SMTP Relay are enabled, then hosts on a pre-approved list can relay without authentication, and those not on the list must authenticate via SMTP AUTH.
- If Restricted SMTP Relay is enabled and SMTP AUTH is disabled, then you are protected from being an open relay, while still allowing local delivery of mail from any host. In other words, SMTP hosts that are not in the Restricted SMTP Relay host list cannot relay through your server, but your local clients could still receive email from them.
  Note: This is the most common configuration.
- Apple Mail Server logs sessions in which there is a failed authentication or an attempt to send mail without authenticating. This is found in Apple Mail Server's activity log, located at /Library/Logs/MailService/AppleMailServer.Server.log. You can read it with the Log Viewer module in the Server Admin application.
- SMTP AUTH is not controlled from the Server Admin application. Instead, it is controlled by a few entries in the local NetInfo database. Apple Mail Server creates these entries for you, but it gives them values that disable SMTP AUTH by default. This means that your mail server continues its prior behavior until you intervene.

Additional information:

For more information on this feature, including setup, see technical documents:

106760: "**Mac OS X Server 10.1: How to Set up SMTP Authentication**"
106762: "**Mac OS X Server: How to Set up Restricted SMTP Relay for Apple Mail Server**"
106763: "**Mac OS X Server 10.1: Restricted SMTP Relay Helps Prevent Unsolicited Email**"
Published Date: Oct 10, 2016

Mac OS X Server 10.1: How to Set up Restricted SMTP Relay for Apple Mail Server

Mac OS X Server 10.1.3 or later offers a Restricted SMTP Relay feature for Apple Mail Server. This document describes how to set it up.

This article has been archived and is no longer updated by Apple.

Note: This document describes versions 10.1.3 and 10.1.4. The procedure is different for versions 10.2 and later.

Steps to set up Restricted SMTP Relay

Important:

1. Before proceeding, you should read technical document 106763: "**Mac OS X Server: Restricted SMTP Relay Helps Prevent Unsolicited Email**"

2. This procedure **will not work** if you do not complete Step 11.

3. This document assumes a basic understanding of NetInfo Manager. If you are familiar with the Terminal, the niutil and kill commands, and process IDs, you may use those instead. See the "Advanced Administrators Only" section below.

Follow these steps to set up Restricted SMTP Relay:

1. If you have not already, update to version 10.1.4 and restart the server. See technical document 106704, "**Mac OS X: How to Update Your Software**".
2. Open the Server Admin application.
3. Be sure that MailServer is running.
4. Open NetInfo Manager (/Applications/Utilities/).
5. Navigate to the "config" directory in the local domain, located in the second column after "/".
6. Select the AppleMailServer directory in the next column. What you see should resemble Figure 1.

Figure 1 NetInfo Manager

7. Edit the "open_relay_addr_flag" property by entering the value of "1". This enables Restricted SMTP Relay.

Important: Next you must edit the "open_relay_addr_list" property, which contains a list of values that may be host names, IP addresses, or IP address ranges from which relaying is allowed. If the Mail Server starts up and these attributes are absent, it creates the attribute open_relay_addr_flag with a value of 0 and the attribute open_relay_addr_list with a value representing the IP address of the local server.

8. To add an additional value to the "open_relay_addr_list" property, choose "New Value" from the "Directory" menu and edit as desired (Figure 2). See the "Example values" section below for syntax examples.

Figure 2 Adding a new value

Figure 3 summarizes the attributes of the Apple Mail Server for the Restrict SMTP Relay feature.

Figure 3 Apple Mail Server attributes

9. Save the new settings and quit NetInfo Manager.
10. Stop and restart Apple Mail Server using Server Admin to enact the new settings.
11. Be sure the checkbox is **deselected** for "Deliver mail to local addresses only (no SMTP relay)" in the Configure Host Settings window of Server Admin (Figure 4). This must be done while Apple Mail Server is running. This allows the server the check the newly created SMTP relay list.

Figure 4 Server Admin

This completes the steps to configure the Restrict SMTP Relay feature. If you need to modify the list of hosts, the procedure can be repeated.

What Restricted SMTP Relay does

Once relay lists have been created and enabled, the Mail Server loads them into a local cache for verification against all incoming SMTP connections. All connections are checked against this list for remote mail delivery regardless of the originating "mail from:" value. Any user who attempts to relay mail from a host not in the approved list will have the message rejected by the server. A user wishing to relay mail from a non-approved host may do so by authenticating via SMTP AUTH (see "Additional Information" below). If you want to assure that your local email users are authenticated when they send email, you can enable the SMTP Authentication ("SMTP AUTH") feature.

The Mail Server reads and processes the open_relay_addr settings in Directory Services when it starts up or after receiving a HUP signal, on the first SMTP session. The ".Server.log" file notes the IP addresses or ranges and the host and domain names added to the valid relay list. Host names that cannot be resolved or malformed address ranges are not added to the relay list. Such a complication would also be noted in the log.

Example values for the host list

A variety of notations can be used for each entry in the open_relay_addr_list. Valid examples include:

- Host Names - myserver.example.com
- Domains - example.com
- Single IP Address - 192.168.123.55
- IP Address Range - 192.168.40.*
  ("*" represents entire range)
- IP Address Range - 192.168.40-43.0-255
  (Ranges explicitly stated)
- IP Address Range: 192.168.40-43.*
  (Mixed notation styles)

Advanced Administrators Only

When it starts up, Apple Mail Server creates attributes in local NetInfo that control the behavior of the Restricted SMTP Relay and SMTP AUTH features. You can edit these values in the Terminal with the niutil command.

1. To view default settings, execute this command as root:

```
niutil -read . /config/AppleMailServer
```

The resulting output:

```
name: AppleMailServer
smtp_plain_login_flag: 0
open_relay_addr_flag: 0
open_relay_addr_list: 17.221.41.168
```

The IP address is the address of the computer on which Apple Mail Server is running. You can enable the Restrict SMTP Relay feature with the following command:

```
niutil -createprop . /config/AppleMailServer open_relay_addr_flag 1
```

2. Deselect the checkbox for the "Deliver mail to local addresses only (no SMTP relay)" in the Configure Host Settings window in the Server Admin application (Figure 4). This cannot be achieved from the Terminal.

3. These NetInfo settings take effect when a HUP signal is received by the MailService process. To send the HUP signal:

```
kill -HUP `ps auxc | grep MailService | awk '{print $2}'`
```

For additional information on this subject, see technical documents:

106760: "**Mac OS X Server: How to Set up SMTP Authentication**"
106761: "**Mac OS X Server: About SMTP Authentication for Apple Mail Server**"

Published Date: Oct 10, 2016

Mac OS X Server: Restricted SMTP Relay Helps Prevent Unsolicited Email ("spam")

Mac OS X Server 10.1.3 or later offers a Restricted SMTP Relay feature for the Apple Mail Server. This allows the server to accept SMTP relay traffic only from approved hosts or IP addresses, thus to avoid being an open relay for people who send unsolicited email or "spammers."
This article has been archived and is no longer updated by Apple.

Restricted SMTP Relay feature to prevent unsolicited email

If you are running the Mail Server feature of a Mac OS X Server that is connected to the Internet, it is essential that you use SMTP restrictions to keep the server from becoming an open relay. An "open relay" is a mail server that allows third parties to send mail to other third parties without authentication. Third parties can find an open relay and use it to send unsolicited email (sometimes called "spam"), and then a variety of spam prevention services will blacklist the open relay. Mac OS X Server 10.1.3 or later includes the Restricted SMTP Relay feature to prevent this.
Points to remember:

- Restricted SMTP Relay utilizes a list of hosts (computers) that you trust, such as those on your local area network (LAN). An entry on this list may be a DNS name, an IP address, or a range of IP addresses.
- After this list is created and the feature enabled, the Mail Server loads the host list into a local cache for verification against all incoming SMTP connections. It checks all connections against this list for remote mail delivery regardless of the originating "mail from:" value. Any user who attempts to relay mail from a host not in the approved host list must authenticate via Authenticated SMTP, or it will have its mail rejected by the server.
  Note: Unless you want your local email clients to have to authenticate via Authenticated SMTP, then you do not need to take any additional steps to set up Authenticated SMTP. Enabling Restricted SMTP Relay automatically enables Authenticated SMTP for hosts not in the host list.
- Whenever Authenticated SMTP is enabled, your email server is effectively a "send only" server, because mail servers from other domains are most likely not configured to authenticate with your server. This means your local email clients can only receive email from other local clients. Authenticated SMTP also requires each user's email client software to authenticate before it sends mail through your server.
- If Restricted SMTP Relay is enabled and Authenticated SMTP is disabled, then you are protected from being an open relay, while still allowing local delivery of mail from any host. In other words, SMTP hosts that are not in the Restricted SMTP Relay host list cannot relay through your server, but your local clients can still receive email from them.
  Note: This is the most common configuration.

Mac OS X: Opening Web Browser Before Connecting to Internet Results in Alert Message

An alert message appears in your Web browser if it attempts to load a page before your dial-up modem has finished connecting to your Internet service provider. Improper DNS settings are an alternative cause.
This article has been archived and is no longer updated by Apple.

Symptom

You see an alert message when opening a Web browser. Possible messages include:

"The specified server could not be found."

"The server could not be found."

"A connection failure has occurred."

Solution

You may see these messages when you open a Web browser before connecting to the Internet. If you have dial-up Internet service, and use the PPP option to "Connect automatically when starting TCP/IP applications," then the application returns these messages because the computer has not had time to complete the dial-up connection sequence. This does not indicate any issue with your computer or Internet service provider. There are two ways to address this:

1. Wait for your modem to finish connecting to your Internet service provider, then click Refresh or Reload in your Web browser to reload the page.

2. Connect to the Internet before opening your Web browser or other TCP/IP application. Use the Internet Connect application.

For more information, see technical document 106325, "**Mac OS X 10.0: How to Disable or Enable Automatic Modem (PPP) Connections**". For best results, do not enable this option.

Alternative cause

If this does not resolve the issue, these same messages may appear when you do not have correct DNS (domain name system) settings. What is correct depends on your Internet service provider. For more information on this possible cause, see technical document 106798, "**Mac OS: Troubleshooting 'A connection failure has occurred', 'The specified server could not be found' or Similar Messages**".

Published Date: Oct 10, 2016

Mac OS X: Effective Password Length of Eight Characters

The effective password length for Mac OS X and Mac OS X Server is eight characters. You may type more characters, but they are ignored.
This article has been archived and is no longer updated by Apple.

Symptom

The System Preferences and Server Admin applications allow you to create passwords longer than eight characters. You can type more than eight characters when using your password, but characters after the eighth are ignored.

Note: This also applies to remote login, via telnet or rlogin for example.

Solution

For information on how to create a secure password with eight characters, see technical document 106521, "**Mac OS X: How to Choose a Secure Password**".

Published Date: Oct 10, 2016

Mac OS X 10.1: Sound is delayed and accompanied by a spinning disc pointer

After installing Mac OS X 10.1.2 through 10.1.5, you may encounter a delay before hearing sounds on certain computers.
This article has been archived and is no longer updated by Apple.

Symptom

After installing Mac OS X 10.1.2 through 10.1.5, you may encounter a sound delay with these characteristics:

- Sounds are produced several seconds later than they should be. The delays average three to four seconds.
- During that delay, the pointer appears as a spinning disc.
- If you immediately reactivate the sound, there is no delay.
- If no sounds are produced for 30 seconds, the delay reoccurs.

This may affect, for example, an alert sound, or the sound that is played when the application Mail receives new email.

Solution

In order to increase battery life, Mac OS X versions 10.1.2 through 10.1.5 turn off your computer's sound hardware when it is not used for 30 seconds. The delay in hearing sounds is the time it takes for the sound hardware to go from its low power mode to sound production.

One way to avoid this issue is by using external USB speakers.

With Mac OS X 10.2 or later, you can set Energy Saver preferences' "Optimize Energy Settings:" for battery to Highest Performance.
Published Date: Oct 10, 2016

Mac OS X Server 10.1.3: Automatic Update Will Not Install if 10.0 Was Previously Installed

If you have updated Mac OS X Server version 10.0.3 or 10.0.4 to version 10.1 or later without erasing the disk, then you must apply the Mac OS X Server 10.1.3 Update with a standalone installer (not with Automatic Software Update).
This article has been archived and is no longer updated by Apple.

Symptom

When you try to use the Software Update feature of System Preferences, "Mac OS X Server 10.1.3" installation will not start.

Sometimes this is related to the file "Info-macos.plist" in the Apache.rasplug package.

Solution

You may temporarily avoid the issue in some cases by using a standalone installer of the software. But to permanently resolve the issue and prevent recurrence,, you should delete the file "Info-macos.plist". Follow these steps:

1. Open Terminal (Applications/Utilities/).
2. At the prompt, type:

```
sudo rm /System/Library/ServerAdmin/Apache.rasplug/Contents/Info-macos.plist
```

3. Press Return.
4. Enter an Admin user password when prompted, then press Return again.
5. Quit Terminal.

Mac OS X: Applications With Calendars Cannot Add March Events With Abbreviated Month Name

You may experience difficulty when adding events for the month of March in applications with a calendar feature, such as Microsoft Entourage v. X. This occurs when the date region is set for Belgium, Italy, Netherlands, or Switzerland (Italian).
This article has been archived and is no longer updated by Apple.

Symptom

If you try to set a calendar event using an abbreviated name for March, the date will be rejected and erased. Examples of abbreviated names for March include "Maa" (Dutch and Belgian) and "Mar" (Italian and Swiss Italian).

Note: This issue occurs any time you schedule an event for March, whether or not it is March when you attempt to schedule the event.

Note: Microsoft Entourage 2001 does not use abbreviated month names by default, so it is only affected if you manually type an abbreviated name.

Solution

For Microsoft Entourage

Instead of creating new events with the toolbar or menu items, follow these steps:

1. Go to the month of March on the calendar.
2. Double-click the calendar date of the event.
3. Fill in all of the necessary information for the event.
Note: Be sure not to modify the date fields.

Alternative workaround

Follow these steps to change the date region:

1. Choose System Preferences from the Apple menu.
2. Choose International from the View menu.
3. Click the Date tab.
4. Change the Region to any other unaffected date region.
5. Choose Log Out from the Apple menu.
6. Log back in.
7. Reopen the affected application.

Mac OS X: Network "Up" Flag Does Not Accurately Indicate Working Connection

The Mac OS X network interface "Up" flag may be seen in the Apple System Profiler and with certain Terminal commands even when the network connection does not work.
This article has been archived and is no longer updated by Apple.

Symptom

You see the network "Up" flag in the Apple System Profiler or Terminal, but you do not have a valid network connection on that network interface (port).

For example: There is no cable attached to the built-in Ethernet port, but the "Up" flag still appears alongside other built-in Ethernet (en0) network interface information.

Solution

Verify a network connection by checking physical connections or accessing other devices on the network (or, if applicable, accessing the Internet). You may be able to use the Network Utility (/Applications/Utilities/) to verify connectivity.

For related information, see these technical documents:

106749: "**Mac OS X: Troubleshooting a Cable or DSL Internet Connection**"
106260: "**Mac OS X: Computer Name Does Not Appear on Network**"
61426: "**Mac OS X: About Network Utility**"

AppleWorks 6 for Windows: Requires "Recommended" or "Full" QuickTime 5 Installation

AppleWorks 6 for Windows requires one of what the QuickTime 5 Installer calls the "Recommended" and "Full" installations. The "Minimum" QuickTime 5 installation does not work.

This article has been archived and is no longer updated by Apple.

Symptom

An alert box with a "runtime error" message appears when you insert a multimedia file (such as a AVI, GIF, JPG or MOV) into an AppleWorks document.

Solution

This occurs if you have installed the "Minimum" version of QuickTime 5. Use the QuickTime 5 Installer on the AppleWorks 6 CD to reinstall QuickTime. Select the "Recommended" installation option.

Published Date: Feb 17, 2012

Mac OS X Server: Mail is Not Delivered to Some Domains

Email sent via Mac OS X Server is not received by (delivered to) users in certain domains.
This article has been archived and is no longer updated by Apple.

Symptom

Users in certain domains do not receive mail sent via your server.

Solution

Affected versions of Mac OS X Server cannot relay mail to SMTP servers that have an SMTP greeting message that is longer than 128 characters. Update to Mac OS X Server version 10.1.4 or later. You may get software updates from Apple Software Downloads (http://www.apple.com/swupdates/), or by using the Automatic Software Update feature of System Preferences. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".
Published Date: Feb 17, 2012

AppleWorks 6: How to Use Function Keys With Macros, or "The Function Keys can be set up" Message

When you press a function key (F1 to F15), you may use the Option key in combination to distinguish between an AppleWorks call and a system call.

This article has been archived and is no longer updated by Apple.

Symptom

When you try to assign a function key to a macro in AppleWorks, or when you try to execute that macro with a function key, an alert box with this message appears:

> "The Function Keys can be set up to open an application, document, server, or other item, such as an AppleScript. Do you want to open the Keyboard control panel now?"

Solution

Both AppleWorks and the Mac OS 9 Finder allow you to assign items to the same function keys, F1 through F15. This alert may appear when you want an AppleWorks function, but you are actually passing a request to the Finder.

To avoid the alert, distinguish your AppleWorks functions by pressing the Option key in combination with the desired function key. Be sure to press and hold Option before the function key.

Using with iBook and PowerBook computers

If your iBook or PowerBook has a function activation key marked "fn" in the lower left corner of the keyboard, you may use it instead of the Option key.

Published Date: Feb 17, 2012

Mac OS: "The connection to this server has been unexpectedly broken" Message

Do you see that message when making a File Sharing connection from Mac OS 8.6 or 9 to Mac OS X? To get rid of it and make a connection, simply assign an IP address to the computer.

This article has been archived and is no longer updated by Apple.

Symptom

When you try make a File Sharing connection from a Mac OS 8.6 or 9 computer to a Mac OS X computer, an alert box with this message appears:

> "The connection to this server has been unexpectedly broken."

The connection is not made.

Solution

The computer at which you see the alert must have an IP Address assigned to it before connecting to a Mac OS X computer.

If you do not know how to assign an IP address, see "**Mac OS: How to Get an IP Address for Connecting to the Internet**".

Tip: You can use this solution even if you do not intend to connect to the Internet. If you use any routing, firewall, or proxy products, be sure that port 548 is not blocked between the two computers. This is the port used by File Sharing.

Published Date: Oct 10, 2016

Mac OS X 10.1: Disk Issues After Installing on Hard Disk That Uses Intech Disk Software

If you encounter issues after installing Mac OS X 10.1 on a hard disk that has been used with Intech Hard Disk SpeedTools software, a solution is available from Intech.
This article has been archived and is no longer updated by Apple.

Symptom

After using a Mac OS X 10.1 Update CD (whether or not Mac OS X 10.1 was actually installed) on a disk that had previously been used with Intech disk software:

- The computer may start up considerably slower than normal.
- The hard disk icon may appear "generic."
- The hard disk cannot be erased.
- The hard disk may not appear on the desktop or in a Finder window.

Solution

A solution is available from Intech. Please see "IMPORTANT NOTE FOR MacOS X [sic] 10.0 through 10.1.5 USERS" at Intech Software Online (http://www.speedtools2.com/HDInfo.html) .

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.1: CD Installation Stops, "File could not be written" Alert Appears

This document explains how to troubleshoot a "File could not be written" alert during Mac OS X 10.1 installation from CD-ROM on a Power Macintosh G3 computer.
This article has been archived and is no longer updated by Apple.

Symptom

Mac OS X 10.1 installation does not complete, and this message appears:

> "File could not be written"

Solution

First, review technical document 106693, "**Mac OS X: Troubleshooting Installation From CD-ROM**".

Follow these steps if the information in document 106693 does not resolve the issue:

1. Shut down the computer and verify that all internal ATA (IDE) devices are properly installed.
2. Check for proper master/slave settings when applicable.
3. Check to see that data and power cables are firmly connected for ATA devices.

Note: Your hard disk should not be set to ATA ID 1 (slave mode) if it is the only ATA device on the bus. See technical document 106728, "**Mac OS X: Cannot Install From ATA ID 1 (Slave) Disc Drive**".

Advanced step: If installation still does not complete, shut down your computer and temporarily disconnect additional ATA devices, such as an internal (ATA) Zip drive, if present. Disconnect the device by unplugging the ATA data cable. Remember that your hard disk should not be set to ATA ID 1 (slave mode) when it is the only device on the ATA bus.

Mac OS 9: "Type 10" Alert Message If You Change a USB Connection While Using FAXstf

You may update FAXstf 6.0 software to avoid a situation in which connecting or disconnecting a USB device while using its Queue Watcher feature causes a Type 10 alert message.
This article has been archived and is no longer updated by Apple.

Symptom

A "Type 10" alert message appears when you connect or disconnect a USB device while using the Queue Watcher feature of FAXstf 6.0 software.

Solution

Download and install the FaxSTF 6.0.5 update from Smith Micro Software (http://smithmicro.com/support/updates.tpl?update=STF6).

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X: No Notification When You Enter an Incorrect Screen Saver Password

If you mistype your password when attempting to dismiss the Screen Saver, it simply resumes. There is no message indicating that you have entered an incorrect password.
This article has been archived and is no longer updated by Apple.
This document is relevant only if you have selected the radio button for "Use my user account password" in the Screen Saver pane of System Preferences.

When Screen Saver is active and you attempt to dismiss it, an authentication dialog appears. Entering an incorrect password dismisses the dialog and returns you to Screen Saver visuals. There is no "incorrect password" alert message.

For more information, see technical document 61319, "**Mac OS X: How to Use the Screen Saver to Protect Your Computer**".
Published Date: Feb 17, 2012

Mac OS X: Formatted Capacity of a 4.7 GB DVD Disc Is 4.29 GB

During the formatting process, a portion of your DVD disc is reserved for catalog and data structure use. Thus formatted capacity is less than the unformatted capacity.
This article has been archived and is no longer updated by Apple.
When formatting a DVD-R or DVD-RW disc, a portion of disc space must be reserved for storing HFS and ISO data structures, and for catalog information. Other types of disks also dedicate space to formatting. The amount of space used may seem more noticeable due to the larger capacity of DVD media.

You should have just under 4.3 GB of space available after formatting your DVD disc. You can verify capacity and available disc space by selecting the disc's icon and choosing Show Info from the File menu.

For more information, see technical document 8647, "**Macintosh: File System Specifications and Terms**".

How to access third-party ink jet printer utilities (Mac OS X)

This article has been archived and is no longer updated by Apple.

Ink jet printers typically come with utilities for cleaning jet nozzles, aligning print heads, and printing test pages. Learn how to use them in Mac OS X.

Printer utilities for many models of ink jet printers by Canon, Epson, and Hewlett Packard are included with Mac OS X as well as Lexmark (and others with Mac OS X 10.4 Tiger). If you have a printer made by another manufacturer or a printer that does not work with one of these utilities, check the manufacturer's website for more information.

There are two ways to open a printer utility application.

Open from Print Center or Printer Setup utility

The printer utility can be opened if the print driver is compatible with the Configure Printer option. Follow these steps:

1. Open Print Center or Printer Setup Utility (/Applications/Utilities/).
2. Select the printer you want, or add your printer if necessary.
3. Choose **Configure Printer** from the **Printers** menu. This automatically opens the printer utility, which then appears in the Dock.

Do this any time you want to use the Printer Utility.

Open the utility in the Finder

If the print driver does not work with the Configure Printer option, then Configure Printer is dimmed in the Printers menu. You can locate the utility in the Finder and open it there. Follow these steps:

1. Click the Finder icon in the Dock to get a new Finder window.
2. Choose **Computer** from the **Go** menu.
3. Open the Mac OS X disk.
4. Open the Library folder.
5. Open the Printers folder. Within the Printers folder there are folders by manufacturer name. These folders contain printer utilities and other items.
6. Locate the printer utility you need and open it.

Do not move the printer utility from its original location. Instead, you may select it then choose Add to Favorites from the File menu. This will add an alias to your Favorites folder, which you may leave there or place elsewhere. Or, just drag it to the Dock.

Mac OS X: About Energy Saver Options

Different Energy Saver feature sets are available on different computers. This document describes individual features and their availability.
This article has been archived and is no longer updated by Apple.

Opening Energy Saver

Energy Saver is a pane in the System Preferences application. To access it, choose System Preferences from the Apple menu, then choose Energy Saver from the View menu. The features listed below may be turned on or off in the Energy Saver pane.

Energy Saver features

"Wake when the modem detects a ring"

This allows the computer to wake from sleep when the modem detects a ring. You may want to use this feature if you receive faxes regularly but want to allow your computer to sleep in order to conserve energy.

Available on these computers:

- Power Mac G4 (AGP Graphics) or later
- Power Mac G4 Cube (all models)
- PowerBook (FireWire) or later
- iBook (all models)
- iMac (Slot Loading) or later

"Wake for network administrative access"

Also known as "Wake-on-LAN," this allows network administrators and certain applications to wake the computer from sleep by sending it a special type of network packet.

Available on these computers:

- All Macintosh computers produced in 2003
- Power Mac G5
- Power Mac G4 (Gigabit Ethernet) or later
- Power Mac G4 Cube (all models)
- PowerBook (FireWire) or later
- iBook (all models)
- iMac (Early 2001) or later

"Restart automatically after a power failure"

This allows your computer to automatically restart after shutting down unexpectedly, usually as the result of a power outage.

Available on these computers:

- Power Mac G4 (AGP Graphics) or later
- Power Mac G4 Cube (all models)
- PowerBook (FireWire) or later
- iBook (all models)
- iMac (Slot Loading) or later

"Show battery status in menu bar"

This displays information about the battery in the menu bar on portable computers.

Available on these computers:

- iBook (all models)
- PowerBook (all models)

"Restart automatically after a system 'freeze'"

This is only available to Mac OS X Server. It allows the computer to automatically restart if the operating system stops responding (a "hang" or "freeze").

Available on these computers:

- Power Mac G4 (Digital Audio) or later
- Power Mac G4 Cube (all models)
- PowerBook (FireWire) or later
- iMac (Slot Loading) or later

"Reduce processor performance"

Also known as "PowerStep," this option allows the software to change the microprocessor's clock speed and/or turn off the L3 cache, slowing down to conserve power or speeding up when more speed is needed.

Available on these computers:

- PowerBook G4 - see Note.
- PowerBook G4 (DVI)
- iBook (Special Edition)
- iBook (Dual USB)
- iBook (Late 2001)
- iBook (14.1-inch LCD)
- iBook (16 VRAM)
- iBook (14.1 LCD 16 VRAM)

Note: This feature is not available on PowerBook G4 (Gigabit Ethernet) computers.

About "Deep sleep"

While all PowerBook and iBook computers go into "deep sleep" when Sleep is selected, some older computers do not. Instead, the display turns off and the hard drive spins down, but many other components (including the processor) remain on.

Deep sleep is available on these computers:

- All PowerBook computers
- All iBook computers
- Power Mac G4 (AGP Graphics) or later
- iMac (Slot Loading) or later

Published Date: Oct 10, 2016

Mac OS X: Background Is Black in Some Windows

You may see a window with a black background (making text unreadable) if the display's color depth setting is set to 256 colors.
This article has been archived and is no longer updated by Apple.

Symptom

Finder, Sherlock, and Help windows have black backgrounds, making it impossible to read the text content.

Solution

This occurs if a Classic application changes the display's color depth setting to 256 colors, or if you use the Monitors control panel in Classic to set the display to 256 colors.

To resolve this issue, follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Displays from the View menu.
3. Click the Display tab, if necessary.
4. Choose Thousands or Millions from the Colors pop-up menu.

For more information, see technical documents:

106175: "**Mac OS X 10.0: Only Use 256 Color Mode and/or 640 x 480 Resolution When Required by Classic**"
25305: "**Mac OS X 10.0: Using Mac OS 9 Control Panels in Classic Environment**"
Published Date: Feb 17, 2012

Macintosh Manager: Hard Disk May Appear as a Panel

Certain replacement hard drives must be reformatted before use with Macintosh Manager to avoid an issue in which the disk appears as a panel in the Panels environment.
This article has been archived and is no longer updated by Apple.

Symptom

1. The startup volume is displayed as a panel.
2. Some applications may report the user does not have adequate permission.

Solution

A version of drive formatting software used to format certain replacement hard drives is incompatible with Macintosh Manager. It is possible that other third-party formatting software might cause this issue. To resolve this issue, a drive must be reformatted with Drive Setup using the zero all data option. If you have a Mac OS 9 CD-ROM disc, you should use its version of Drive Setup, regardless of which version of Mac OS you intend to install. If you do not have a Mac OS 9 CD-ROM disc and intend to install an earlier Mac OS version, you should download Drive Setup 1.7.3 from Apple Software Downloads (http://www.apple.com/swupdates/).

Follow these steps:

Warning: Initializing a disk destroys all data on it. Be sure to back up any data you wish to keep before proceeding.

1. Start up the computer from a disk other than the affected hard drive. A Mac OS 9 CD-ROM disc is preferred. To start up from CD, insert the CD into the disc drive and restart the computer. Press and hold the "c" key as the computer restarts.
   Note: If the startup disk you are using is not a Mac OS CD-ROM disc, be sure that Drive Setup is on the disk. Mac OS discs include Drive Setup in the Utilities folder.
2. Open Drive Setup.
3. Select the affected drive from the list.
4. Choose Initialization Options from the Functions menu.
5. Select the checkbox for "Zero all data."
6. Click OK.
7. Click Initialize.

Zeroing all data may take several hours to complete.
Published Date: Feb 17, 2012

Mac OS X: Some Fonts Do Not Have Alternate Typefaces (Such as Bold and Italic)

Some Mac OS X fonts do not offer alternate typefaces, such as bold and italic.
This article has been archived and is no longer updated by Apple.

Symptom

Some Mac OS X fonts do not offer alternate typeface choices, such as bold and italic.

Solution

Many Mac OS X fonts offer additional typefaces, including:

- Arial
- Courier
- Georgia
- Helvetica
- Hoefler Text
- Palatino
- Times
- Trebuchet MS
- Verdana

Third-party fonts may also offer bold or italic typefaces. To check for the availability of additional fonts and software, choose Get Mac OS X Software from the Apple menu.
Published Date: Feb 17, 2012

Mac OS X: Empty White Space, or "Box," Appears on Desktop After Classic Starts

A rectangular white space appears on the desktop after Classic starts up and cannot be removed. The white space indicates the presence of an inaccessible dialog box.
This article has been archived and is no longer updated by Apple.

Symptom

A rectangular white space appears on the desktop after Classic starts up.

Figure 1 Empty white space on desktop

Note: This may occur if you have checked an AppleShare (AFP) volume to be opened at system startup time in the Chooser, and that volume requires a password. If this applies to you, see the "AppleShare automatic connection issue" section below.

Solution

The white space indicates the presence of a Mac OS 9 dialog box that you cannot access via Classic. This issue may be avoided by updating to Mac OS X 10.2 or later. To resolve the issue in earlier versions:

1. Choose System Preferences from the Apple menu.
2. Choose Startup Disk from the View menu.
3. Select the Mac OS 9 System Folder as the startup System Folder.
4. Restart the computer.
5. Once Mac OS 9 starts up, you should see the dialog box's contents. Take steps to remedy the situation.
6. When the situation is resolved within Mac OS 9, start up from Mac OS X again.

For more information on how to switch between Mac OS 9 and Mac OS X, see technical document 106667, "**How to Switch Between Mac OS 9 and Mac OS X**".

AppleShare automatic connection issue

If you have a server alias that automatically connects to a server at Mac OS 9 startup, and that server requires a password, then follow these steps:

Remove the server alias from the Servers folder, located in the Mac OS 9 (Classic) System Folder.
Set up the computer to automatically connect to the server at start up by following the steps in technical document 106729, "**Mac OS X 10.1: How to Automatically Connect to a Server When You Log In**".
Published Date: Feb 17, 2012

Mac OS 9: Outlook Express Spell Checking Requires Microsoft Office

Microsoft Outlook Express offers spell checking if Microsoft Office is installed.
This article has been archived and is no longer updated by Apple.
Outlook Express Help states:

"About checking spelling

"If Microsoft Office is installed on your computer, you can use Microsoft Outlook Express to check spelling in your e-mail messages."

For further assistance with Outlook Express, please consult Microsoft support resources, which include Microsoft Mactopia (http://www.mactopia.com/).

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

The following article can help you search for a particular vendor's address and phone number:

Article 17159: "**Locating Vendor Information**"
Published Date: Feb 18, 2012

Mac OS X: How to Create Port Configurations

Mac OS X can automatically connect to the Internet, or other networks, two or more different ways with the same Ethernet port. Each additional connection is achieved by creating a new port configuration.
This article has been archived and is no longer updated by Apple.
This document assumes familiarity with the Automatic location. If you need to review this first, see technical document 106653, "**Mac OS X: How to Use Locations**".

When using the Automatic location in its default state, Mac OS X detects which of your network interfaces is/are connected to a network. You do not have to manually switch between **different** interfaces when using this location in its default state.

But what if you must set up the **same** network interface two different ways, manually at work but via DHCP at home, for example?

The default automatic location does not accommodate having both configuration choices active on the same interface at the same time. You could create two different locations and switch between them. But if you prefer not to switch, this is easily remedied by adding a new port configuration to the existing location.

Note: For most practical purposes, creation of port configurations applies to the Ethernet port. Though Mac OS X 10.1 allows you to create additional port configurations for AirPort, you should use only one for best results. The ability to create multiple port configurations for AirPort has been removed in Mac OS X 10.2 and later. However, multiple AirPort configurations may be present in Mac OS X 10.2 if they were created in Mac OS X 10.1 and then retained during an upgrade installation. In this case, it is recommended that you deactivate the extra AirPort port configurations.

Creating a new port configuration

Follow these steps:

1. Choose Location from the Apple menu and Network Preferences from the submenu.
2. Be sure the Location menu is set to Automatic, or your whichever location you prefer.
3. For Mac OS X 10.2 or later: Choose Network Port Configurations from the Show pop-up menu.
For Mac OS X 10.1: Choose Active Network Ports from the Show pop-up menu.
For Mc OS X 10.0: Choose Advanced from the Configure pop-up menu.
4. Select the Ethernet port configuration that you are using from the list.
5. Click Duplicate.
6. Name the new port configuration as desired, then click OK.
7. Choose the new port configuration from the Show menu.
8. Set up the new port configuration as desired.

Each port configuration is set up as its own Internet connection. If you need any help setting up for the Internet, see these technical documents.
Note: Steps for setting up a connection on an Ethernet LAN are the same as for cable/DSL.

106715: "**Mac OS X: How to Connect to the Internet With Cable or DSL**"
106716: "**Mac OS X: How to Connect to the Internet With PPPoE**"

QuickTime Streaming Server: When Making a Playlist, a Folder or Disk Appears as a File, Preventing Access to Its Contents

An apostrophe (') or backslash (\\) character in the name of any directory (a folder or disk in the Finder) causes it to appear as a file to Streaming Server Admin, preventing access to its contents.

This article has been archived and is no longer updated by Apple.

Symptom

Your designated media directory or a subdirectory (folder) inside it appears to be a file in Streaming Server Admin. This prevents access to the contents of the folder, and you cannot add this content to the Playlist.

Figure 1 illustrates what you would see if the name of folder in the media directory contained an apostrophe:

Figure 1 "6 Gig o'Mostly Texas iTunes" appears as a file

Solution

Do not use the apostrophe or backslash characters in the name of any disk or folder that is your designated media directory in Streaming Server Admin or in any of its subfolders. Remove any of these that you find.

Many MP3 players, including iTunes, offer you the ability to automatically name your files and folders when encoding (or "ripping") music. This is done by downloading names from the Gracenote CDDB service. CDDB can use characters like the apostrophe, so you may find it in your Media Directory if you have used CDDB.

Because using an automatic service like CDDB is likely to save you more time than is required to remove apostrophes, the most efficient solution is to remove the apostrophes from the affected directories' names. When importing new music, be sure to watch for new apostrophes and to subsequently remove them.

This document may be updated as more information on this issue becomes available.

Published Date: Feb 17, 2012

Mac OS X: iSub Speaker Does Not Mute After Headphones Are Connected

Because the iSub is designed to be used with other speakers, it is not muted when headphones are connected (with the exception of USB headphones).
This article has been archived and is no longer updated by Apple.

Symptom

You connect headphones to your computer, but the iSub speaker's volume does not mute as you may expect.

Solution

The iSub is a subwoofer-type speaker designed to be used in conjunction with a pair of speakers. Your computer does not distinguish between analog headphones and analog speakers when you connect either to the computer's analog sound output port. Therefore it is the correct behavior for the iSub not to be muted.

The iSub is muted if you connect USB headphones. Alternatively, disconnect the iSub when you do not wish to hear it.
Published Date: Feb 17, 2012

Mac OS 9: How to Connect a Windows-Compatible Printer to a Macintosh

This document discusses connecting a Microsoft Windows-compatible printer to a Macintosh computer.
This article has been archived and is no longer updated by Apple.
In many cases, the same printers are used for both Windows-compatible and Macintosh computers. Frequently, you only need to download the correct drivers for the printer-operating system combination that you are using. In some cases, you may need an adapter cable (USB-to-parallel, for example). Try these solutions:

1. Check with the printer's manufacture to see if there is a Mac OS driver for the specific printer, and if an adapter cable is necessary.

2. When the manufacturer of your printer does not provide Mac OS drivers, you may be able to purchase drivers and adapter cables from other manufacturers who sell an assortment of popular printer drivers for the express purpose of connecting Windows-compatible printers to Macintosh. You can search the Macintosh Products Guide for such products (http://guide.apple.com/). One example is PowerPrint by Strydent Software (http://www.strydent.com/).

3. If you have a Mac OS X-compatible computer, consider upgrading. Mac OS X includes built-in drivers for many popular printers.

For additional information, see these technical documents:

106163: "**Mac OS X 10.0, 10.1: System Requirements**"
106490: "**Mac OS X 10.1: Many Third-Party Ink Jet Printer Drivers Are Included**"
106516: "**Mac OS X 10.1: Includes PPDs for Many PostScript Printers**"

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information. Document 17159: "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.
Published Date: Feb 18, 2012

Mac OS 9: "Printer Not Recognized" in the Chooser

This document discusses troubleshooting a printer that is not recognized, and that does not appear in the Chooser.
This article has been archived and is no longer updated by Apple.

Symptom

A printer connected to your computer is not available in the Chooser.

Solution

Note: The order in which the following steps are presented is designed to be most useful when at least one of the following is true:

- You have attempted to install Macintosh-compatible drivers for the printer.
- The printer previously appeared in the Chooser of the connected computer.
- The printer is an Apple model for which drivers are part of Mac OS 9.

Follow these steps:

1. Check with the printer's manufacturer that it is compatible with the version of Mac OS you have installed. Check the documentation included with the printer, or the outside of its box. If necessary, see the manufacturer's Web site.

2. Disconnect everything from the computer except for the power cord, keyboard, mouse, printer, and monitor. This helps isolate the cause of the issue.

Note: If you are troubleshooting a network printer, create an isolated network consisting of a computer and the printer, using a crossover cable or a simple hub.

3. Verify that all cables are connected properly. You may need to disconnect and reconnect to be sure.

4. Use the keyboard and mouse that came with the computer.

5. Make sure that the printer is turned on and not in an error state. See documentation included with the printer for information on identifying an error state.

6. Choose Apple System Profiler from the Apple menu. Check here to see if the system recognizes that a printer is connected. If the printer appears here, the issue is probably software related. If the printer does not appear here, the issue is probably hardware related.

7. Make sure the latest printer driver software is installed. Check the Web site of the printer manufacture, and download new software if available.

8. Check for an extension conflict. See technical document 30929: "**Mac OS: Extension Conflict Troubleshooting/Extensions Manager Features**".

9. Try different or known good cabling.

10. Try the printer on a different compatible Macintosh computer. Be sure to install appropriate drivers on the second computer if they are not already installed.

11. Perform a clean installation of the system software using the Mac OS CD that came with the computer. (You must use the system software CD that came with the computer, or a later version, in order to get the correct version of the Mac OS.)

12. If after performing all of these steps the printer is recognized by a different Macintosh, and still is not recognized by the first computer, the first computer will probably need to be evaluated by an Apple Authorized Service Provider.

13. If the printer is not recognized in the Chooser of any Macintosh computer on which appropriate drivers have been installed, contact the manufacturer of the printer for further troubleshooting.

TA20752_Mac_OS_Printer_Not_Recognized_in_the_Chooser.pdf

Mac OS X: "Configure Printer" Command Dimmed in Print Center

The Configure Printer command is dimmed in the Printers menu of Print Center.
This article has been archived and is no longer updated by Apple.

Symptom

- The Configure Printer command is dimmed in the Printers menu of Print Center.

Solution

This is the expected behavior in all versions of Mac OS X 10.0 through Mac OS X 10.1.

This has been changed in Mac OS X 10.2 where locally connected printers can be configured using the printer queue, or through your printer's own printer utility software. Postscript printers use Postscript Printer Description files or PPDs for installed options and configurations.

See document 107004 "**Mac OS X 10.2: How to Modify the Print Center Print Queue**" For detailed instructions on configuring a printer using the Print Queue.

Published Date: Oct 10, 2016

Apple Remote Desktop: Using Observe and Control Features on a Wireless (AirPort) Network

This document discusses how to use computers with Apple Remote Desktop on an 802.11 wireless Ethernet (AirPort) network.
This article has been archived and is no longer updated by Apple.

Symptom

An alert with a "communication error" message in the Computer Status window appears when Using Apple Remote Desktop to observe or control client computers via a wireless connection.

Solution

A. If you are using Apple AirPort hardware:

1. Update the client computer's AirPort software to the latest version.
2. Using a computer that has the latest AirPort software installed, connect to the AirPort base station with the AirPort Admin Utility.
3. Update the base station software when prompted.
4. In the AirPort Admin Utility, configure the base station for a Base Station Density of "High", and set the multicast rate to 11 Mb.

You can get the latest software from Apple Software Downloads (http://www.apple.com/swupdates/).

Note: Increasing the Base Station Density setting to High may decrease the usable distance between the wireless client and the access point (AirPort Base Station)

B. If you are using third-party 802.11 hardware:

Be sure that the client and base station software are both up to date. If you use AirPort client software to connect to a third-party base station, try using the latest AirPort software version. Consult third-party support resources for any questions regarding third-party software and compatibility.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"
Published Date: Oct 10, 2016

Mac OS 9: "A System error occurred while executing an Internet Scripting command" Alert Message

An alert box appears when using the "Browse the Internet" application. This document explains how to resolve the issue.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears when you open the Browse the Internet application:

> "A System error occurred while executing an Internet Scripting command."

Solution

When Mac OS 9 and Mac OS X are both installed on the same hard disk, using the Browse the Internet application may result in this alert. Instead of using Browse the Internet, open the desired Web browser directly from the Finder. Alternatively, create and use an alias of the Web browser application.

In the absence of Mac OS X, this issue can occur if system software is incomplete, improperly installed, or has become unusable. You may try these steps:

1. Reinstall Mac OS 9.
2. Reinstall the desired Web browser.
3. Rebuild the desktop, as described in technical document 10182, "**Mac OS: Rebuilding Desktop File and Icon Recovery**".

Additional information

Browse the Internet is a script (a small application) that opens the Web browser that you have chosen in the Internet control panel of Mac OS 9. It is not a browser and does not add any other features to your Web browser. It is functionally similar to an alias.

This issue may occur if you use Browse the Internet when Mac OS 9 and Mac OS X are installed on the same disk or partition. This is the manner in which new computers are shipped from Apple.

Mac OS X includes a later version of Internet Explorer designed to work only in Mac OS X. When the Browse the Internet application is opened, the operating system looks for the Web browser designated in the Internet control panel; additionally it looks for the latest version of that browser on your hard disk, without differentiating whether the latest version is exclusively for Mac OS 9 or Mac OS X. If the Internet control panel is set to use Internet Explorer, Browse the Internet may attempt to open the version of Internet Explorer designed for Mac OS X. It will not be able to open this application, and the alert results.

For more information about the launch order of applications under OS 9, see technical document 17713, "**Finder Search Path for Applications**".
Published Date: Feb 18, 2012

Mac OS X: About the Empty Trash Alert Message

This document explains when the "Are you sure you want to remove the items in the Trash permanently?" alert message will appear.
This article has been archived and is no longer updated by Apple.

When the alert appears

If you want an alert box with the message "Are you sure you want to remove the items in the Trash permanently?" to appear before emptying the Trash, the corresponding checkbox must be selected in the Finder Preferences. It then appears when you choose Empty Trash from the Finder menu.

Note: If you use a contextual menu (Control-click) to empty the Trash, the alert box does not appear.

How to enable/disable or avoid the alert message

Use Finder Preferences to enable or disable the alert box. By using contextual menus, you may avoid the alert on a per-incident basis.

Finder Preferences

1. Click the Finder icon in the Dock.
2. Choose Preferences from the Finder application menu.
3. Select or deselect the "Show warning before emptying the Trash" checkbox, as desired.

Contextual menu

If you want to leave the warning on but avoid it on a per-incident basis, you can use a contextual menu instead of the menu command.

1. Control-click the Trash in the Dock.
2. Choose Empty Trash from the contextual menu that appears.

Note: "Control-click" means to press and hold the Control key while clicking an item. As an alternative, you may press and hold the mouse button until the contextual menu appears. To learn more about clicking, contextual menus, and the Dock, see technical document 106743, "**Mac OS X 10.1: Additional Features of the Dock**".
Published Date: Oct 10, 2016

Mac OS X Server: How to Restrict Non-Owner Access to Home Directories

Mac OS X allows users read-execute (no write) access to the first level of others' Home directories, which is a change from earlier AppleShare default behavior, in which a user had no access to another user's directory by default. This document describes how to change this behavior, if desired.

This article has been archived and is no longer updated by Apple.

In Mac OS X and Mac OS X Server, the default behavior is that any user can look into another user's Home directory. As shown in Figure 1, the Home folders are not locked.

Figure 1 Accessible Home folders

However, the only folders that any non-owner user can look inside are the Public and Sites folders. This feature allows users to immediately begin sharing without any additional setup, while still protecting information in other folders (such as Documents). In the earlier AppleShare behavior to which you may be accustomed, the default was that users did not have any privileges to another's directory. As shown in Figure 2, the folders would appear locked, with the belt-badged icon.

Figure 2 Access denied to Home folders

In some environments, the earlier behavior may be desired. Follow these steps to change the privileges of the Users directory:

1. At the server where the Users directory is stored, open Terminal (/Applications/Utilities/).
2. Type: `su`
3. Press Return.
4. Type the Admin user password.
5. Press Return.
6. Type: `cd /`
7. Press Return.
8. Type: `chmod -R 700 /Users`
9. Press Return.
10. Type: `chmod 755 /Users`
11. Press Return.
12. Type: `cd /Users`
13. Press Return.
14. Type: `chmod 666 .DS_Store`
15. Press: Return.
16. Type: `chmod 333 Shared`
17. Press: Return.

All Home directories should now resemble those in Figure 2, and only the owners have complete access.

Published Date: Feb 17, 2012

Apple Network Assistant: Do Not Use With Mac OS X

You should not use Apple Network Assistant on any Mac OS X volume. A Mac OS X volume copied, in whole or in part, by Network Assistant may not work as expected.
This article has been archived and is no longer updated by Apple.

Symptom

After using Network Assistant on a Mac OS X volume, the following may occur if you try to start up the computer from Mac OS X:

- The computer does not start up.
- The computer starts up to a flashing question mark.
- A kernel panic happens during or after startup.
- Other unexpected behavior occurs.

Note: Apple Network Assistant is designed to work only with Mac OS versions up to and including Mac OS 9.2.2. It is not designed to manage Mac OS X systems.

Solution

Do not use Network Assistant to copy Mac OS X volumes. To prevent this issue in the future, you should use Apple Remote Desktop for remote management of Mac OS X computers. For more information on this product, see the Apple Remote Desktop product page (http://www.apple.com/remotedesktop/).

Resetting permissions

This issue occurs because Network Assistant was not designed to preserve the permissions information that is associated with each file in Mac OS X. The Network Assistant Manage commands Copy Items and Copy Hard Disk do not maintain permissions information for any copied files. Without these permissions, Mac OS X cannot work as expected.

To correct the changes made by Network Assistant, you must manually reset permissions (or "privileges"). You may do this using either the Terminal (/Applications/Utilities/) or a third-party utility. For more information, see technical document 106712, "**Mac OS X: Troubleshooting Permissions Issues**".
Published Date: Oct 10, 2016

Mac OS X 10.1.5: Video Mirroring Setting Changes After Upgrading

After updating to Mac OS X version 10.1.5, video mirroring may be disabled and extended desktop may be enabled. If necessary, re-enable video mirroring using the Displays pane of System Preferences.
This article has been archived and is no longer updated by Apple.

Symptom

After updating to Mac OS X on a computer with an additional display connected, extended desktop is enabled instead of video mirroring.

Solution

Use the Displays preference pane to re-enable mirroring:

1. Open System Preferences from the Apple menu.
2. Choose Displays from the View menu.
3. Click the Arrange tab.
4. Select Mirror Displays.
5. Quit System Preferences.

Published Date: Oct 10, 2016

Apple Remote Desktop: Issues Controlling or Observing a Client When a Text Message Is Displayed

When a text message sent by an Apple Remote Desktop administrator is displayed on a client computer's screen, attempts to control and observe the client fail.

This article has been archived and is no longer updated by Apple.

Symptom

Note: This document applies to the Text Message feature, found in the Manage menu of Remote Desktop. It does not apply to the Text Chat feature.

If a text message is displayed on a client's screen, attempts to use the Control or Observe feature could fail in the following ways:

1. The text message dialog is not shown on the administrator's screen while controlling or observing the client.

2. If observing a client, changes and updates on the client's screen are not displayed on the administrator's screen.

3. When controlling a Mac OS X client, the administrator's screen does not show interaction with the client computer other than moving the mouse, even though such additional action may be occurring. The actions (such as opening a folder) do appear on the client screen. At this point the client's screen is not in sync with the administrator's screen. On client computers using Mac OS versions 8.1 to 9.2.2, clicking anywhere outside the text message dialog will sound a system alert beep.

4. After effects of Controlling
If the text message is not dismissed and the Administrator stops controlling the computer, the Computer Status window indicates the client is "Controlled by: This Screen". No other Apple Remote Desktop commands can be used on this client computer while in this state. An alert message says "You can't use this command on computers that are sharing screens."

5. After affects of Observing
If the text message is not dismissed and the administrator stops observing the computer, the Computer Status window displays client status correctly. However, no other Apple Remote Desktop commands will be accepted by this client computer. An alert is displayed indicating "You can't use this command on computers that are sharing screens."

Solution

Mac OS 8 and Mac OS 9

If in an active Control session, press the Return or Enter key on the administrator's keyboard to dismiss the Text Message on the client and return to normal use.

If in an active Observe session, discontinue the Observe session and use the client computer's keyboard to dismiss the Text Message.

Mac OS X or Mac OS X Server

If in an active Control session, pressing the Return or Enter key on the administrator's keyboard may or may not dismiss the Text Message. If not, discontinue the Control or Observe session and use the keyboard or mouse on the client computer to dismiss the Text Message window.

Xserve: Must Erase RAID Volumes Before Installing Bundled Mac OS X Server

The Mac OS X Server Installer included with Xserve does not allow you to erase a RAID volume as part of the installation. You should erase the RAID volume with Disk Utility prior to installation.
This article has been archived and is no longer updated by Apple.

Symptom

The option to erase the target volume is dimmed (unavailable) in the Mac OS X Server Installer. The only option is to install over an existing installation.

Solution

Prior to using the Installer, use Disk Utility to erase the RAID volume.

Warning: Remember to back up any important data from the target volume before erasing.

When started up from a Mac OS X Server installation CD, you may access Disk Utility from the Installer menu prior to clicking Continue. If you have clicked Continue, you must restart from CD, or use Disk Utility while started up from a hard disk volume.

Xserve, Mac OS X Server 10.3: Server Monitor requires reverse DNS lookup

This article has been archived and is no longer updated by Apple.

In the absence of DNS reverse lookup, specific conditions must be met to connect to Xserve with Server Monitor.

Symptom or issue

1. When you do not have DNS service on a network, you must make connections via IP address (such as "10.0.1.2") rather than by DNS name (such as "myserver.apple.com"). However, server Monitor does not connect to Xserve using its IP address when:

· you are using the product on a network that does not have domain name system (DNS) service,

and

· the hostname of the server is set to something other than "localhost".

2. After adding an Xserve to the Server Monitor, you may see the message 'Waiting for response' in Status Summary.

Solution

To connect with Server Monitor on an isolated network that does not have DNS service, use "localhost" as the hostname of the server.

The reason for this is that Server Monitor requires either:

- that the IP address of a server be resolved using a DNS name assigned to the server's IP address,

  or
- that one of several other specific actions be taken, which include using "localhost" as the server's hostname or making modifications to NetInfo.

In the absence of DNS service, using "localhost" is simplest way to allow Server Monitor to connect.

Note: The steps below should only be used on newly installed server, because changing the hostname on an established server could interrupt services that rely on the hostname.

How to set a hostname

1. Open the file "/etc/hostconfig".
2. Locate the line that begins "HOSTNAME=".
3. Change the line to read: HOSTNAME=localhost
4. Save the change.
5. Restart the server.

For further instruction on editing the hostconfig file, including important precautionary statements, see "Mac OS X Server: How to Locate and Edit Configuration Files".

Benefits of DNS service

For best results, establish DNS service on the network. This would allow you to assign desired hostnames and to connect via DNS names. The server should have a fully qualified DNS record that includes reverse lookup information.

AirPort Base Station (Graphite): Cannot Connect After Switch to Comcast or Rogers Internet Service Provider

The AirPort Base Station (Graphite) may not be able to connect to the Internet after switching to Comcast or Rogers cable modem services.
This article has been archived and is no longer updated by Apple.

Symptom

The base station issues IP addresses to wireless clients through DHCP and NAT, but these clients cannot access the Internet. When a computer is directly connected to the Comcast or Rogers cable modem, the computer is able to access the Internet.

Solution

AirPort Base Station Update 3.84 corrects potential issues with the AirPort Base Station (Graphite) when connected to Comcast or Rogers cable modems and services. You only need this update if you have Comcast or Rogers service and have not been able to connect with your AirPort Base Station (Graphite). See software download document 120107, "**AirPort Graphite Base Station Update 3.84: Information and Download**".

Security Update April 2002: Enhancements and "Before You Install" Information

Security Update April 2002 addresses certain issues and updates Mac OS X system software.

This article has been archived and is no longer updated by Apple.

Security Update April 2002 requires Mac OS X 10.1.3.

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. Follow these steps if your password needs to be changed: Choose System Preferences from the Apple menu. Choose Users from the View menu. Select an Admin user and click Edit User. Click the Password tab. Change the password and click OK.

2. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If you experience a power outage or other interruption during installation, use the standalone installer (see below) from Apple Software Downloads to install.

Installation

There are two ways to update with Security Update April 2002.

I. Automatic Software Update Installation

See technical document 106704, "**Mac OS X: How to Update Your Software**". Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

II. Standalone Installer

A standalone installer is available from software download document 120111, "**Security Update April 2002: Information and Download**".

You can search all software updates at Apple Software Downloads (http://www.apple.com/swupdates/).

Do not reinstall earlier Mac OS X updates

You should not reinstall any earlier updates after using Security Update April 2002, including:

- Security Update 10-19-01
- Installer Update 1.0
- Mac OS X 10.0.x
- Mac OS X 10.1
- Mac OS X 10.1.1
- Mac OS X 10.1.2
- Mac OS X 10.1.3

Updates should be installed in the correct order. If for any reason you need to reinstall a software update prior to Security Update April 2002, the Mac OS X startup volume should be erased, after first backing up important documents and data. Reinstall Mac OS X, and install updates in the correct order.

Enhancements Delivered with Mac OS X Security Update April 2002

Newer versions of certain components are included to enhance Mac OS X security:

- Apache Mod_PHP
- Apache Mod_SSL
- OpenSSH
- sudo
- rsync
- groff
- /usr/bin/mail (a mail function in the Darwin subsystem unrelated to Mail.app)

For more information, please see the Security Updates page (http://www.apple.com/support/security/security_updates.html).

Mac OS X: Classic startup stalls when almost complete

If a server that is aliased in the Classic (Mac OS 9) System Folder's Server's folder is not available, Classic may not finish starting up.
This article has been archived and is no longer updated by Apple.
As Classic starts up, the loading system extension icons appear then disappear as they normally do. The progress bar in the Classic startup window indicates that Classic startup is almost complete. At this point, Classic stalls and does not finish starting up.

This may occur if a Mac OS 9-based AppleShare (AFP) server that is aliased in the Classic (Mac OS 9) System Folder's Servers folder is not available.

You may choose to solve only the immediate issue by getting Classic started, or you may choose to additionally remove the server alias(es) that caused the issue.

Complete Classic's startup

1. Click the desktop, or any item in the Dock.
2. If the "Classic Environment starting up" window remains, click it once. Classic will finish starting up.

Classic does not finish starting up, click Stop, then click "Stop Classic." In this case, you need to follow the steps in the next section.

Delete the Servers folder and create new startup items

1. Locate the Mac OS 9 (Classic) "System Folder", which should not be confused with the Mac OS X folder named only "System".
2. Locate the Servers folder. Drag the Servers folder to the Trash.
3. Start Classic again. Classic should start up as expected.
4. Create server startup items. See "Mac OS X: How to Automatically Connect to the Server When You Log In".

Tips

1. This issue may not occur as long as the server is available. You may wish to take precautionary measures to avoid this if the server is not available in the future. See the section above.

2. One reason that a server may not be available to Mac OS X, but may be available to Mac OS 9, is that the server does not have an IP address. See "Connecting to AppleShare or File Sharing Requires TCP/IP".

For related information, see technical documents:

106678: "Mac OS X: Classic Will Not Start Up - Mac OS 9 Not Installed or Not Blessed"
151909: "The Classic environment fails to start or stops working"
25214: "Mac OS 9: Brief Delay When Desktop First Appears"
60544: "Mac OS 9: What Is the Servers Folder in the System Folder?"

AppleWorks 6: Imported PDF Files Print in Low Resolution

PDF content that is embedded in an AppleWorks document prints in low resolution if the Fractional Character Widths option is not enabled.

This article has been archived and is no longer updated by Apple.

Symptom

When printing a document that contains an embedded PDF file, the PDF prints in low resolution.

Solution

Enable the Fractional Character Widths option in the AppleWorks General Preferences. Follow these steps:

AppleWorks in Mac OS 9

1. Choose Preferences from the Edit menu, then choose General from the submenu.
2. Choose Text from the Topic pop-up menu.
3. Select the checkbox for Fractional Character Width.
4. Click OK.

AppleWorks in Mac OS X

1. Locate the Preferences menu item that has a submenu, as indicated by the presence of a disclosure triangle.
Note: This item will be in either the Edit menu (earlier AppleWorks 6 versions) or the AppleWorks application menu (later AppleWorks 6 versions).
2. Choose Preferences from the appropriate menu, then choose General from the submenu.
3. Choose Text from the Topic pop-up menu.
4. Select the checkbox for Fractional Character Width.
5. Click OK.

Published Date: Feb 17, 2012

Mac OS X: Unable to Access Delete/Former User‘s Files or Folders

A deleted user's files and folders are inaccessible to Admin users if they were assigned to "System Administrator" when deleted.
This article has been archived and is no longer updated by Apple.

Symptom

When logged in as an Admin user, you cannot access the Home directory or files of a former, deleted user in the Finder.

For more information on the Home directory, see technical document 106167, "**Mac OS X: Using Your Home Directory**".

Solution

When deleting a user with the Users preference pane of System Preferences, a dialog appears to confirm whether you really wish to delete the user. This dialog also asks if the contents of the deleted user's Home directory should be reassigned to a current user or to System Administrator, which is the default choice (Figure 1).

Figure 1 Deleting a user

The term "System Administrator" actually refers to the "root" user, not to "Admin" users. The terms are similar, but they should not be confused. If System Administrator is selected, then the Home directory of the Deleted user will not be available to any other user, not even to an Admin user. To avoid this situation, choose a user other than System Administrator. For more information, see technical documents:

106256: "**Mac OS X: Deleting a Former User's Home Directory (Folder)**"
31375: "**Mac OS: Deleting Same Name User's Folder in Mac OS 9.1 Affects Mac OS X 10.0**"
106290: "**Mac OS X: About the root User and How to Enable It**"
Published Date: Oct 10, 2016

Mac OS X 10.1: About ColorSync and Displays System Preferences

This document explains how the ColorSync and Displays panes of the System Preferences application relate to each other.
This article has been archived and is no longer updated by Apple.
Important: The following terms and concepts are used throughout this document. You should review them first.

Terms and concepts

Mac OS X automatically generates two types of information relevant to ColorSync setup when you start up a computer. This is done for any connected **display**, such as an Apple Cinema Display or built-in PowerBook LCD display, that broadcasts self-descriptive data using the EDID protocol. Current Apple displays and most third-party displays transmit this information.

First, Mac OS X makes a list of all displays connected to your computer. Each list entity, which will later appear as a menu selection, is a known as a **display device** or **device name**. This device name is actually derived from information permanently stored in the display hardware itself. Examples of device names are "Studio Display 21" and "Color LCD".

Second, Mac OS X generates a ColorSync **profile** to be associated with the display device. The profile includes a description of the display's color reproduction characteristics, and it is also created using information that is permanently stored in the display hardware itself. You may change the profile associated with a display device at a later time. Profiles are stored on the hard disk at: /System/Library/ColorSync/Profiles/Displays/

The profile that is generated at startup shares the same name as the device name. When making menu selections, it is important to remember that these are two different software entities. The Display pop-up menu, discussed below, is an example of where both display devices and profiles appear in the same place.

The term **Displays pane** always refers to what you can access by choosing Displays from the View menu while in the System Preferences application.

The term **ColorSync pane** always refers to what you can access by choosing ColorSync from the View menu while in the System Preferences application. To see the **Display pop-up menu**, click the Device Profiles tab.

About ColorSync and Displays panes

Display may seem to have three names

For each display, there is a device name, a profile that has the same name by default, and a profile filename. The profile name is what you see in system and program menus, while the profile's filename contains the ".icc" extension and may be seen as part of a full pathname. Holding the mouse pointer still over any of the pop-up menus in the ColorSync pane of System Preferences brings up Help text showing the name of the display device, profile name, and profile pathname (Figure 1); or it may simply show the path to a specific profile (Figure 2). This can help you determine if the current setting is a display device or a profile.

Figure 1 Device name, profile name, and profile pathname

Figure 2 Profile pathname

Difference between the ColorSync pane and Displays pane

The Displays pane includes a wide range of settings, including geometry, arrangement, resolution and color depth. You can make display-specific color adjustments in the Displays pane , including the assignment of a ColorSync profile to a display device, but it does not encompass the entire color management process. When you select the Displays pane, a System Preferences window appears on each connected display. This clearly identifies which display you are adjusting.

The ColorSync pane focuses on the entire color management process, and it does not include the general, noncolor display settings.

ColorSync functions included in the Displays pane of System Preferences

Here you can assign a different ColorSync profile to each display. You can do the same thing and more using the ColorSync Utility (located at /Applications/Utilities/).

Functions of the ColorSync pane

The ColorSync pane of System Preference gives you control over the entire color management process, including the ability to:

- set default profiles for input, display, output, and proofing devices
- set default profiles for document color spaces, including RGB, CMYK, Gray, and Lab (and you can programmatically set a default profile for XYZ space)
- select a preferred CMM
- save these color settings in named "workflows" and switch between them

The ColorSync pane provides choices that are not available in the Displays pane

Setting the "system profile"

The Display pop-up menu in the ColorSync pane determines what is used as the system profile. This is what Mac OS X returns to an application that requests the "system profile." Here you may choose from two different types of entities: display devices and ColorSync profiles. If you choose a display device here (which is the default choice), then the system profile returned to requesting applications is the one selected for that display device in the Displays pane. If you choose a ColorSync profile here, then it is used as the system profile. See below for more information on this behavior.

How to determine which profile is authoritative if the system profile and individual displays are all assigned different profiles

When the system profile and individual display profiles do not match, behavior varies with different types of applications. Individual applications have different ways of indicating to you which profile is in use. You can experiment to see what happens and what works best for you. See the documentation or help files included with your application. Cocoa applications only use the preferred display device's profile, or "system profile." For most predictable results, set the Display pop-up menu to a device name and choose the profile in the Displays pane. This is not a concern for most users, who have one display and use the default profile.

If you have one display

By default, your display is the only designated display device, and its profile is the one automatically generated when you started up the computer. You do not need to change any settings. However, if you want to create a new profile or change its profile, use the Displays pane of System Preferences. Alternatively, you may go directly to the Display Calibrator application located in the Utilities folder (/Applications/Utilities/).

Mac OS 9.2, Mac OS X: "Code Fragment could not be prepared. ‘PrefRestoreInit‘ error type 1010" During Computer or Classic Startup

A "code fragment" or "PrefRestoreInit" alert message during Mac OS 9 or Classic startup is related to the FileSharingLib extension. Replace it or delete a preference file to resolve the issue.

This article has been archived and is no longer updated by Apple.

Symptom

When either starting up the computer from Mac OS 9.2 or 9.2.1, or when starting up the Classic environment from the same, an alert box with this message appears:

> "Code Fragment could not be prepared. 'PrefRestoreInit' error type 1010"

Solution

This alert box may appear if the FileSharingLib extension is not in the Extensions folder. This issue is resolved by updating to Mac OS 9.2.2. See Apple Software Downloads (http://www.apple.com/swupdates/).

If you cannot update immediately, follow these steps:

1. As Classic or Mac OS 9 starts up, press and hold the Shift key to disable extensions.
2. Locate the FileSharingLib extension. If it is not in the "Extensions (Disabled)" folder of the System Folder, then try locating it with the Mac OS X version of Sherlock (if applicable).
   Alternative solution: If you cannot locate this extension, an alternative solution is to find the file "PrefRestoreInit", which should be in the Extensions folder inside the System Folder.
3. Drag FileSharingLib into the Extensions folder, which is in the Mac OS 9 System Folder.
   Alternative solution: If you could not find FileSharingLib in the last step, then remove PrefRestoreInit from the Extensions folder.
4. Restart the computer or Classic, allowing extensions to load normally.

Mac OS X: About Long File Names

Mac OS X uses file names up to 255 characters long. You normally see a shortened version on the desktop or in the Finder.
This article has been archived and is no longer updated by Apple.
Mac OS X uses file names that are up to 255 characters for files that are stored on Mac OS Extended (HFS Plus) format volumes.

A truncated version of a desktop file's long name can normally be seen. Hold the mouse pointer over a shortened file name to see the long name.

If a file with a long name is viewed while started up from Mac OS 9, some of the file name's first twenty five characters are displayed along with a unique hexadecimal reference number. To view the full file name, start up from Mac OS X.

When using a Mac OS Standard format volume, file names are limited to 31 characters.

Mac OS X 10.1: How to Change Default Currency Symbol to the Euro

This document explains how to set the default currency symbol to the euro.
This article has been archived and is no longer updated by Apple.

Symptom

Applications that rely on the currency setting in the International pane of System Preferences, such as Microsoft Excel and AppleWorks, don't display the euro, but instead display national currency symbols.

Solution

1. Choose System Preferences from the Apple menu.
2. Choose International from the View menu.
3. Click the Numbers tab.
4. Type the euro glyph (€) in the Symbol field, as in Figure 1. See technical document 61586: "**Mac OS: How to Type the Euro Glyph**" for more information.

Figure 1 International pane of System Preferences

Additional information

When a document uses the system's default currency symbol (as defined by the locale), it is subject to change when opened by a user who has a different locale. For example, the currency symbol might change from euro to yen if you emailed it to a colleague in Japan. You may prevent this if your application has a custom numbers format feature that allows the currency symbol to remain the same regardless of locale. Excel is an example of an application that has a custom numbers format feature.

Mac OS X: Mouse Speed Changes Unexpectedly, Follows Trackpad Speed

You can set tracking speed for a mouse and trackpad independently, but the mouse speed is reset to the trackpad speed after you restart your computer.
This article has been archived and is no longer updated by Apple.

Symptom

In the Mouse pane of System Preferences you set your mouse and trackpad to two different speeds on the slider. They maintain separate speeds until you restart your computer. After that, the mouse speed has changed to match the trackpad speed.

Solution

You must reset your mouse to the desired speed each time you restart. Otherwise, you should choose a common speed that is acceptable to you.

This document may be updated as more information is available.

Mac OS: Disk Is Available in Mac OS X But Not in Mac OS 9

A disk formatted in Mac OS X may not become available ("mount") when started up from Mac OS 9 if the Mac OS 9 hard disk drivers are not installed.
This article has been archived and is no longer updated by Apple.

Symptom

A disk that is available in Mac OS X is not available when the computer is started up from Mac OS 9.

Solution

Is the disk UFS-formatted?

UFS-formatted volumes are not available in Mac OS 9. If this is the case, may wish to erase the disk and use a different format (such as Mac OS Extended), as described in section II below.

I. Try Drive Setup first

Depending on the history of the affected disk (Note 1), using Drive Setup to update drivers may resolve the situation. Try these steps first:

1. Start up the computer from a Mac OS 9 CD (Note 2).
2. Open Drive Setup, which is normally located at in the Utilities folder in the "Applications (Mac OS 9)" folder.
3. Select the disk that you wish to make available.
4. Choose Update Driver from the Functions menu (Note 3). This message appears:

"The new driver will not be available until you restart the computer."

5. Restart the computer.

Notes:

1. If the disk was last formatted with Drive Setup (included with Mac OS 9), a third-party disk utility, or the Partition function of Disk Utility (included with Mac OS X), then you may be able to use Drive Setup to update the drivers. If the disk was last formatted using the Erase function of Disk Utility, then you need to continue to Section II, below. Disk Utility in Mac OS X versions 10.0 to 10.0.4 included the Partition but not the Erase function, so you should be able to use Drive Setup on a disk that was last formatted for or by Mac OS X 10.0 to 10.0.4.

2. This requires a "bootable" Mac OS 9 CD, one from which your computer may start up. Some Mac OS 9 Restore CDs included with recent computers are not bootable.

3. If the Update Driver menu selection is dimmed, you cannot use Drive Setup to update the Mac OS 9 drivers on this disk. You should continue to Section II.

II. Using Disk Utility

Warning: These solutions involve formatting the disk. Formatting a disk removes all data contained on the disk. You should first back up important data and documents.

Disk Utility can install Mac OS 9 disk drivers when partitioning or easing your disk. Choose the method (A or B) that you prefer. Partitioning divides your disk so that it virtually behaves as two or more disks. A partition may be erased or reformatted without affecting other partitions contained on the same physical disk. If you do not need that, choose to simply erase the disk.

A. Erasing the disk

1. Start up the computer from a Mac OS X Installation CD. When the first screen of the Installer appears, be sure **not** to click anything. If you do, you must restart the computer again.
2. Choose Disk Utility from the Installer application menu.
3. Select the disk in the left-hand column (see Note).
4. Click the Erase tab.

5. Select the "Install Mac OS 9 Drivers" checkbox.
6. Click Erase.

Note: You must choose the entire disk (Figure 1), not just a volume contained on it. If you are formatting only a partition of your startup disk, you cannot install Mac OS 9 drivers.

Figure 1 Disk Utility

B. Partitioning the disk

Alternatively, you may also avoid this issue by using the Partition function. If you only want the hard disk to be one volume, select one partition.

1. In Disk Utility, click the Partition tab.
2. Select the disk, not a volume of the disk. The message "Select a single disk in order to set it up" appears until a single disk is selected.
3. Set up partitions as desired.
4. Verify that the "Install Mac OS 9 Disk Drivers" option is selected (in the Options box).
5. Click "OK".

Mac OS X Server 10.1: Sample File (db.example.com) for Configuring DNS in a NAT Environment

This document provides a sample file used for technical document 106853, "**Mac OS X Server 10.1: How to Set Up DNS in a NAT Environment**". You should use this information only as instructed in technical document 106853.
This article has been archived and is no longer updated by Apple.
This document provides an example hostname-to-address lookup database file.

Caution: You should be aware that the incorrect configuration of DNS settings can result in serious system issues. Only experienced users should manipulate these settings.

------ Copy Below This Line --------

```
$TTL 86401
; db.example.com from Apple Knowledge Base Article Number
;
; CAUTION: Users should be aware that the incorrect configuration of DNS
; settings can result in serious system issues. It is recommended that only
; experienced users manipulate these settings.

Mac OS X: Icons Have Black Stripes or Bars

Under some conditions, Mac OS X icons may be drawn with black horizontal lines (bars, stripes, bands).
This article has been archived and is no longer updated by Apple.

Symptom

Mac OS X icons in the Finder or Dock appear with black horizontal lines (bars, stripes, bands) over them, as in Figure 1.

Figure 1 Icons with black lines

Solution

This is a cosmetic issue. It cannot be resolved by troubleshooting. The issue may occur more often when the computer is using a lot of virtual memory. Restarting the computer or installing more memory (RAM) may prevent the issue from occurring as often, depending on how the computer is used.

Published Date: Feb 20, 2012

Mac OS X Update 10.1.4: Enhancements and "Before You Install" Information

Mac OS X Update 10.1.4 addresses certain issues and updates system software.

This article has been archived and is no longer updated by Apple.

This software has been replaced by a later update. Because later updates include previous enhancements, the following information is still provided for reference. To find current software, see technical document 106713, "**Mac OS X 10.1: Chart of Available Software Updates**".

Enhancements delivered with this update

In addition to enhancements previously delivered with versions 10.1.1, 10.1.2 and 10.1.3, Mac OS X version 10.1.4 includes the following:

- Resolves a potential delay that could occur when connecting to the Internet using a dial-up modem (PPP connection).
- Improves compatibility with certain single- and dual-channel SCSI cards.
- Reduces time needed for Sherlock file searches.
- Improves usability of Sherlock when searching a Mac OS X Server volume.
- Enhances security with increased TCP broadcast address communication filtering.
- Improves compatibility with certain third-party network routers (AppleTalk source sockets 128 or higher are now used).

Apple Remote Desktop: Troubleshooting Connection to Client Behind NAT Router

This document explains how to troubleshoot when Apple Remote Desktop cannot connect to a computer that is behind a network address translation (NAT) router, such as the AirPort Base Station. **Note:** This document specifically covers connecting from a public IP address to a private IP address, as described in technical document 106847, "**Apple Remote Desktop: How to Connect Through a Firewall or NAT**". This article has been archived and is no longer updated by Apple.

Symptom

From a public IP address, Apple Remote Desktop is unable to connect to a client that is behind a NAT router. This alert message appears:

> "There was a problem communicating with (IP Address)."

Solution

Use the following troubleshooting steps:

1. Make sure the client is set up properly and works with an Apple Remote Desktop admin computer on the local, private network. If this does not work on the local network, then it will not work from across networks. If the client can be controlled from an Apple Remote Desktop admin computer on the local network, continue to step 2.

2. Check that the NAT router's IP address is correct, and that port mapping is working. You can do this by setting up a Web server on the internal network and mapping port 80 to the internal IP address of this server. In Mac OS 9, the default Web server is Personal Web Sharing. In Mac OS X, the default Web server is Apache. Be sure that a client on the private network can load pages from the Web server, then test the connection across networks.

3. Verify that the router hardware (including AirPort Base Station) has the latest firmware installed. Check with the hardware manufacturer for the latest version.

Mac OS X 10.1: "An unexpected error has occurred. -108" Alert Appears

When attempting to print in Mac OS X 10.1 or later, you may see an alert box with a message that says "An unexpected error has occurred. -108".
This article has been archived and is no longer updated by Apple.
For a discussion of this issue, see technical document 106726, "**Mac OS X 10.1: Cannot Print or Add Printer, or Print Center Quits Unexpectedly**".
Published Date: Feb 17, 2012

Mac OS 9: How to Connect to the Internet via Cable, DSL, or Local Area Network (LAN)

To connect to the Internet via a cable modem, digital subscriber line (DSL), or an Ethernet local area network (LAN), set up your TCP/IP control panel for the "Built-in Ethernet" port. You may use the Internet Setup Assistant, if preferred.
This article has been archived and is no longer updated by Apple.

Notes

1. This document does not apply to Mac OS 9 when used in the Classic environment of Mac OS X. The Classic environment uses Mac OS X network settings. For information on Mac OS X connectivity, see technical document 106796, "**Mac OS X: Internet and Network Topics (Getting Connected, Troubleshooting)**".

2. If your Internet service provider (ISP) requires PPPoE, see technical document 106868, "**Mac OS 9: How to Connect to the Internet With PPPoE**".

Gather information

Before you begin, gather this information from your ISP or network administrator:

- domain name server (DNS) addresses
- whether you should choose DHCP or manual IP address configuration, (used in Step 3 below).

For manual configuration only:

- IP address
- router address
- subnet mask

Notes

1. It is possible that your ISP or local network does not provide DNS addresses, but rather has a method for providing this automatically.

2. Once you have this information, you may stop here and use the Internet Setup Assistant, or you may continue with the steps below to configure manually, using the TCP/IP control panel. The location of the Internet Setup Assistant on your hard disk differs slightly between versions of Mac OS 9, so you may use Sherlock to find it.

Steps to connect

Follow these steps for manual configuration:

1. Open the TCP/IP control panel.
2. Choose Built-in Ethernet from the Connect Via pop-up menu.
3. From the Configure pop-up menu, choose either DHCP or Manually, as instructed by your ISP or network administrator.
4. Type the other information you gathered into the corresponding fields. Unless your ISP instructs you otherwise, you may ignore the DHCP Client ID field and the Search Domains field.
5. Close the TCP/IP control panel.
6. Click Save when prompted.
7. Open a Web browser or other TCP/IP application to test your connection to the Internet.

Published Date: Feb 18, 2012

Mac OS 9: How to Connect to the Internet With PPPoE

Many digital subscriber line (DSL) Internet service providers require customers to connect via PPPoE. In Mac OS 9, this requires use of third-party connection software.
This article has been archived and is no longer updated by Apple.
Note: This document does not apply to Mac OS 9 when used in the Classic environment of Mac OS X. The Classic environment uses Mac OS X network settings. For information on Mac OS X connectivity, see technical document 106796, "**Mac OS X: Internet and Network Topics (Getting Connected, Troubleshooting)**".

Connecting with PPPoE

PPPoE stands for "Point-to-Point Protocol over Ethernet." To connect via PPPoE in Mac OS 9, you must use a third-party PPPoE client. Your Internet service provider should provide this software or tell you where to get it. Two commonly used examples are:

- EnterNet, by Efficient Systems
- MacPoET, by Fine Point Technologies

Follow instructions provided by your ISP or by the software vendor.

In the event that you are instructed to make any adjustments to your IP configuration outside of the PPPoE client, use the TCP/IP control panel. To access it, choose Control Panels from the Apple, then double-click the TCP/IP control panel.

Upgrading to Mac OS X

Mac OS X can connect via PPPoE without any additional software, which is one advantage of upgrading. To learn more, see the Mac OS X product page (http://www.apple.com/macosx/). To find out if your computer can use Mac OS X, see technical document 106163, "**Mac OS X 10.0, 10.1: System Requirements**".

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information. Document 17159: "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number:
Published Date: Feb 18, 2012

Mac OS 9: How to Connect to the Internet via PPP (Dial-Up Access)

Use the steps in this document to connect to the Internet using the Point-to-Point Protocol (PPP), which is also known as "dial-up" access.
This article has been archived and is no longer updated by Apple.
Note: This document does not apply to Mac OS 9 when used in the Classic environment of Mac OS X. The Classic environment uses Mac OS X network settings. For information on Mac OS X connectivity, see technical document 106796, "**Mac OS X: Internet and Network Topics (Getting Connected, Troubleshooting)**".

Gather information

Before you begin, gather this information from your Internet service provider (ISP):

- user name and password
- dial-up number
- Domain Name System (DNS) server addresses
- whether you should choose to configure IP information via PPP or manually (see Note 1)

Once you have this information, you may stop here and use the Internet Setup Assistant, or you may continue with the steps below to configure manually, using the Remote Access, Modem, and TCP/IP control panels. The location of the Internet Setup Assistant on your hard disk differs slightly between versions of Mac OS 9, so you may use Sherlock to find it.

Notes

1. If there is any uncertainty, try via PPP first. Manually would be used only if your ISP gave you a static IP address, which is rare for a dial-up connection. This information is used in Step 15, below.

2. If your ISP requires customized software in lieu of a standard PPP connection, contact them to obtain a copy that is compatible with Mac OS 9.

3. A modem is required. If your computer does not have a built-in modem, then select your external modem in Step 8.

4. If you select the checkbox in Step 6, below, and later find out that your computer is connecting to the Internet at unexpected times, see technical document 24877, "**Mac OS: Modem Unexpectedly Dials**".

Steps to connect

Follow these steps to connect:

1. Open the Remote Access control panel.
2. Click the radio button for Registered User.
3. Type the user name, password, and phone number into the corresponding fields. If you want your password to be saved so that you do not have to enter it at each connection, select the checkbox for "Save password".
4. Click Options.
5. Click the Protocol tab.
6. Locate the checkbox for "Connect automatically when starting TCP/IP applications". If you want your computer to dial up automatically when necessary, select this box (see Note 4, above).
7. Choose Modem from the RemoteAccess menu.
8. Choose your modem from the Modem pop-up menu. If you need help making this selection, see technical document 106650, "**Mac OS 9, Mac OS X: How to Choose an Apple Modem**".
9. Set the modem sound on or off, as desired.
10. If your local phone exchange does not work with touch-tone phones, select the radio button for Pulse.
11. Close the Modem control panel, clicking Save when prompted.
12. Close the Remote Access control panel, clicking Save when prompted.
13. Open the TCP/IP control panel.
14. Choose PPP from the Connect via pop-up menu.
15. Choose PPP or Manually from the Configure pop-up menu, as you were instructed by your ISP.
16. Enter your DNS server address(es) in the "Name server addr" field. Unless instructed otherwise by your ISP, you may ignore the "Search domains" field.
17. Close the TCP/IP control panel, clicking Save when prompted.
18. Open the Control Strip (Figure 1), and locate the Remote Access portion, which is labeled with the icon of a Macintosh computer over a telephone pole (Figure 2). If the Control Strip is not visible, open the Control Strip control panel and select Show Control Strip.

Figure 1 The Control Strip

Figure 2 The Remote Access portion of the Control Strip

19. If you did not select "Automatically connect" in Step 6, then you may connect manually by choosing "Connect" from the Remote Access portion of the Control Strip.
20. Open a Web browser to check your connection to the Internet. If you selected "Automatically Connect" in Step 6, then your modem should dial up now.

Mac OS 9: Troubleshooting a Cable Modem, DSL, or LAN Internet Connection

This document offers a general strategy for troubleshooting cable modem, digital subscriber line (DSL), or LAN connectivity issues.
This article has been archived and is no longer updated by Apple.

Symptom

You are not able to connect to the Internet using your cable modem, DSL, or LAN.

Note: If your Internet service provider requires you to connect via PPPoE, stop here and go to technical document 106872, "**Mac OS 9: Troubleshooting a PPPoE Internet Connection**".

Note: This document does not apply to Mac OS 9 when used in the Classic environment of Mac OS X. The Classic environment uses Mac OS X network settings. For information on Mac OS X connectivity, see technical document 106796, "**Mac OS X: Internet and Network Topics (Getting Connected, Troubleshooting)**".

Solution

Note: Comments and steps specific to modems do not apply to LAN users. LAN users connect with a hub, connection pod, switch, or router. Cable and DSL users may or may not have these components, depending on the network. LAN users should contact their network administrator instead of an Internet service provider.

Check all cables and power supplies

Verify that all cables related to the modem are plugged in and firmly inserted. This includes the modem's power cord, the cable from the modem to the computer, and the cable from the modem to the wall outlet. To be sure a connection is properly inserted, disconnect and reconnect it. Be sure that cables have not been cut, chewed, or otherwise damaged.

If you have any hubs, pods, or routers in use, be sure to check all cables and power supplies. If you have more than one power supply available for a type of hub or router, try swapping the power supplies. A defective power supply may affect network traffic.

Reset/power cycle modem hardware

Cycle the power on your DSL or cable modem by turning it off for a few minutes then turning it back on. Some ISPs recommend that you unplug the modem's power cord. This is required if the modem does not have a power button. If the modem has a reset button, you may try it before or after cycling the power.

Check indicator lights on modem

Some DSL and cable modems have indicator lights that can provide useful information about cabling connections. A "Cable" light may indicate that the cable network is available, whereas a "PC" light may indicate that the modem recognizes the connection to your computer. If such a light remains off after you have checked your cables and cycled the power, contact your Internet service provider (ISP).

Check TCP/IP Control Panel settings

Open the TCP/IP control panel, and check to be sure that the settings are still correct. If you have an IP address that begins in 169 or 192, then you may not be successfully connecting to the network. For help verifying that your connection is set up properly, see technical document 106867, "**Mac OS 9: How to Connect to the Internet via Cable, DSL, or Local Area Network (LAN)**".

Network troubleshooting

If you have two or more computers attempting to share an Internet connection, be sure that your network is set up properly. You need to know if your ISP provides only one IP address or if it provides multiple IP addresses. If only one IP address is used, then you must have a router capable of sharing the connection, also known as network address translation (NAT) or "IP masquerading." Check the documentation provided with your router for setup information. Check with the person who set up your network. The AirPort Base Station may be used for this routing function. For more information on using the AirPort Base station, see technical documents:

120061: "**Designing AirPort Networks for Mac OS X (v10.1) Manuals**"
75138: "**Designing AirPort Networks for Mac OS 9 Document**"

Contact your ISP

If you have not resolved the issue with the above steps, contact your Internet service provider.

Published Date: Oct 10, 2016

Mac OS 8, Mac OS 9: Troubleshooting a Dial-Up/PPP Internet Connection

This document offers a general strategy for troubleshooting dial-up/PPP connectivity issues.
This article has been archived and is no longer updated by Apple.

Symptom

You are not able to connect to the Internet using your dial-up (PPP) service provider.

Note: This document does not apply to Mac OS 9 when used in the Classic environment of Mac OS X. The Classic environment uses Mac OS X network settings. For information on Mac OS X connectivity, see technical document 106796, "**Mac OS X: Internet and Network Topics (Getting Connected, Troubleshooting)**".

Solution

Check phone outlet and cables, call waiting, line quality

Make sure your phone outlet or "jack" is good by connecting a telephone to it. Be sure that the phone cable between the jack and your modem is plugged in and firmly inserted. To be sure that a cable is properly inserted, disconnect and reconnect it. If you are using an external modem, check the connection to your computer and its power cord. Be sure that cables are not cut, chewed, or otherwise damaged. If you experience frequent or random disconnection, consider these possible causes:

- **Disconnect if idle feature**
  You can set your computer to automatically disconnect from the Internet after a period of inactivity. Familiarize yourself with this setting, which is found in PPP Options. Be sure this is not your issue before spending time on your phone line. Similarly, your Internet service provider may automatically disconnect you when you are idle. Ask your Internet service provider what its idle disconnection policy is.
- **Call Waiting**
  If you have call waiting, your Internet connection may be interrupted by an incoming call. Check your phone book to obtain the appropriate code for turning off call waiting on a per-call basis. In North America, it is usually "*70". Enter this code as a prefix followed by two commas when typing your dial-up phone number. For example, if your dial-up phone number is 555-1111, then you could enter "*70,,5551111" as your dial-up phone number. The commas are used to pause between tones, allowing the code prefix to be acknowledged before dialing.
- **Phone off the hook**
  Be sure that others in your home or office are not using telephones on the same line.
- **Environmental interference**
  It is possible that your phone line receives interference from a strong electrical field, or an electric or radio appliance. Try an outlet in another area or remove potential sources of interference, if possible.
- **Phone line quality**
  Analog phone lines ("POTS," or plain old telephone service) are generally maintained for voice quality. Your modem may reveal quality issues with your phone line that are not considered when evaluating for voice quality, and that are not perceptible to the human ear. If frequent disconnects cannot be isolated to another cause, you may need to investigate phone line quality by contacting your telephone company. If you cannot resolve an issue with phone line quality, consider other alternatives that may be available in your area, including cable, DSL, ISDN, satellite service, and so forth.

For an expanded discussion of this subject matter, see technical document 24803, "**Troubleshooting Phone Line Issues That Affect Modem Connections**".

Avoid the Ethernet port

The Ethernet port and the modem port look alike, but the Ethernet port is wider. On many Macintosh computers, it is possible to plug a standard RJ-11 phone cable into the Ethernet port, though this has been prevented on some models. Be sure to connect your phone cable to the modem port. Figure 1 illustrates the similarities and differences in these two ports. Note that the ports have identifying icons.

Figure 1 Ports of an iMac computer

Check your connection settings

Open the TCP/IP, Modem, and Remote Access control panels, and check that the settings are still correct (early Mac OS 8 versions may have a PPP control panel instead of Remote Access). If you have an IP address that begins in 169 or 192, then you may not be successfully connecting to

the network. If you need help verifying that your connection is set up properly, try repeating the steps in technical document 106869, "**Mac OS 9: How to Connect to the Internet via PPP (Dial-Up Access)**".

Delete TCP/IP Preferences and MacTCP DNR

If you still cannot connect, it is possible that a damaged TCP/IP preference file or MacTCP DNR file is contributing to this symptom. Record your TCP/IP settings elsewhere so that they can later be re-entered, then delete these preference files:

- Macintosh HD : System Folder : Preferences : TCP/IP Preferences
- Macintosh HD : System Folder : MacTCP DNR (If you do not see this file, skip this step).

Note: Mac OS 9.1 and later will not recreate the MacTCP DNR file. Drag this file to the desktop instead of the Trash unless you are sure you have no earlier programs that may require it (these programs would likely refer to MacTCP instead of Open Transport or TCP/IP).

Restart your computer and re-enter your TCP/IP control panel settings. You may discard the TCP/IP Preferences and MacTCP DNR file.

Be sure your software is up to date

Under certain circumstances, your modem may need a software update to work properly. If you have an Apple built-in modem, be sure that you have the latest update for the version of Mac OS that you are using, and that you have installed any applicable modem update for your computer model. You may search Apple Software Downloads using the word "modem" and the model name of your computer (http://www.apple.com/swupdates/). If you have a third-party modem, check the manufacturer's website for possible modem script, driver, or firmware updates.

Contact your ISP

If you have not resolved the issue with these steps, contact your Internet service provider.

Mac OS 9: Troubleshooting a PPPoE Internet Connection

This document offers a general strategy for troubleshooting PPPoE connectivity issues.
This article has been archived and is no longer updated by Apple.

Symptom

You are unable to connect to your Internet service provider using PPPoE.

Note: This document does not apply to Mac OS 9 when used in the Classic environment of Mac OS X. The Classic environment uses Mac OS X network settings. For information on Mac OS X connectivity, see technical document 106796, "**Mac OS X: Internet and Network Topics (Getting Connected, Troubleshooting)**".

Solution

Check modem cables

Verify that all cables related to the modem are plugged in and firmly inserted. This includes the modem's power cord, the cable from the modem to the computer, and the cable from the modem to the wall outlet. To be sure a connection is properly inserted, disconnect and reconnect it. Be sure that cables have not been cut, chewed, or otherwise damaged.

If you have any hubs or routers in use, be sure to check all cables and power supplies. If you have more than one power supply available for a type of hub or router, try swapping the power supplies. A defective power supply may affect network traffic.

Reset/power cycle modem hardware

Cycle the power on your DSL or cable modem by turning it off for a few minutes then turning it back on. Some ISPs recommend that you unplug the modem's power cord. This is required if the modem does not have a power button. If the modem has a reset button, you may try it before or after cycling the power.

Check indicator lights on modem

Some DSL and cable modems have indicator lights that can provide useful information about cabling connections. A "Cable" light may indicate that the cable network is available, whereas a "PC" light may indicate that the modem recognizes the connection to your computer. If such a light remains off after you have checked your cables and cycled the power, contact your Internet service provider (ISP).

Check System Preferences settings

Open your third-party PPPoE client software, and be sure that it is still properly set up. If you were required to change settings in the Mac OS TCP/IP control panel, check to be sure that they are correct. If you have an IP address that begins in 169 or 192, then you may not be successfully connecting to the network. For more information, see technical document 106868, "**Mac OS 9: How to Connect to the Internet With PPPoE**".

Network troubleshooting

If you have two or more computers attempting to share an Internet connection, be sure that your network is set up properly. You need to know if your ISP provides only one IP address or if it provides multiple IP addresses. If only one IP address is used, then you must have a router capable of connecting via PPPoE and sharing that connection, also known as network address translation (NAT) or "IP masquerading." Check the documentation that came with your router for setup information. Check with the person who set up your network. The AirPort Base Station may be used for this routing function. For more information on using the AirPort Base station, see technical documents:

120061: "**Designing AirPort Networks for Mac OS X (v10.1) Manuals**"
75138: "**Designing AirPort Networks for Mac OS 9 Document**"

Contact your ISP

If you have not resolved the issue with the above steps, contact your Internet service provider.

Mac OS X: How to Use Custom Icons

This document explains how to add or delete custom icons for applications, folders, or documents.
This article has been archived and is no longer updated by Apple.

How to add a custom icon

Note: This document uses the Get Info command. On earlier versions of Mac OS X, this appears as the Show Info command. The function is the same.

After downloading or copying the custom icon file(s) to your computer follow these steps:

1. Select the desired icon in the Finder.
2. Choose Get Info from the File menu.
3. Click the icon that appears in the Info window.
4. Choose Copy from the Edit menu.
Note: Leave the Info window open.
5. In the Finder, select the application, folder, or document whose icon you want to change. Note that the Info window immediately updates to display the newly selected item.
6. Click the icon that appears in the Info window.
7. Choose Paste from the Edit menu.
8. Close the Info window.

Note: You must have write permission to change an item's custom icon. See technical document 106712: "**Mac OS X: Troubleshooting Permissions Issues**" for more information.

How to delete a custom icon

1. Select the item in the Finder from which you wish to delete a custom icon.
2. Choose Get Info from the File menu.
3. Click the icon in the Info window.
4. Press the Delete key.
5. Close the Info window.

Where to find custom icons

Mac OS X - "Downloads Icons, Screensavers, etc."
http://www.apple.com/downloads/macosx/icons_screensavers/

AppleCare Knowledge Base

Mac OS 9: Internet and Network Topics (Getting Connected, Troubleshooting)

This document discusses common Internet and network topics, including how to connect to the Internet, how to troubleshoot your Internet connection, and how to set up a small network.
This article has been archived and is no longer updated by Apple.
Topics covered in this document:

I. Internet Connection and Troubleshooting
II. Troubleshooting Web Browser issues
III. DNS Issues, such as "Server could not be found"
IV. Setting up email
V. Creating a small network
VI. Setting up File Sharing
VII. Using your computer in different locations
VIII. Setting Internet preferences

I. Internet Connection and Troubleshooting

These are the three major types of Internet connection, with links to connection and troubleshooting instructions. The following section on DNS issues applies to all three connection types.

A. PPP, also known as "Dial-up" or "plain old telephone service (POTS)"

These documents explain how to connect to the Internet or troubleshoot your service if you use a modem with an analog telephone line (POTS).

106869: "**Mac OS 9: How to Connect to the Internet via PPP (Dial-Up Access)**".
106871: "**Mac OS 9: Troubleshooting a Dial-Up/PPP Internet Connection**"

Unexpected PPP dial-up

If your computer automatically dials to connect to the Internet when you do not expect or want it to, see technical document 24877, "**Mac OS: Modem Unexpectedly Dials**".

B. Ethernet connection from cable modem, DSL, or LAN

These documents explain how to connect to the Internet or troubleshoot your service if you have a cable modem, digital subscriber line (DSL), or a local area network (LAN). You use your computer's Ethernet port to connect to these services.

106867: "**Mac OS 9: How to Connect to the Internet via Cable, DSL, or Local Area Network (LAN)**".
106870: "**Mac OS 9: Troubleshooting a Cable Modem, DSL, or LAN Internet Connection**"

C. PPP over Ethernet (PPPoE)

Use these documents if your cable or DSL Internet service provider requires you to connect to the Internet using PPPoE.

106868: "**Mac OS 9: How to Connect to the Internet With PPPoE**"
106872: "**Mac OS 9: Troubleshooting a PPPoE Internet Connection**"

II. Troubleshooting Web browser issues

If your Web browser can connect to the Internet but has other issues, such as quitting unexpectedly or becoming unresponsive (a "freeze"), then see technical document 106874, "**Mac OS: Web Browser Quits Unexpectedly or Stops Responding**".

III. DNS Issues - "Server Could Not Be Found", Loading Web Pages Slow

A. DNS-related alert messages

You may successfully connect to the Internet and yet not be able to load Web pages or perform other TCP/IP tasks. You may see messages such as:

"The server could not be found."
"The specified server could not be found."
"A connection failure has occurred."
"Connection attempt failed."
"Name servers not responding."

B. Delay before connection

You may be able to load Web pages but encounter delays before the page loading starts.

Both symptoms A and B may be caused by issues with your domain name system (DNS) server, which is provided by your Internet service provider or network administrator for translating names like "www.apple.com" to their numerical IP addresses. For more information, see technical documents:

106798: "**Mac OS: Troubleshooting 'A connection failure has occurred', 'The specified server could not be found' or Similar Messages**"
106799: "**Mac OS: Long Delay Before Web Pages Start to Load, Then Load Suddenly at Normal Speed**"

IV. Setting up email

For information on setting up an email, see technical document 106878, "**Mac OS 9: How to Set Up Email**".

V. Creating a small network

For information on creating a small Ethernet network, see technical document 106658, "**Macintosh: How to Create a Small Ethernet Network**". Links are provided to AirPort Base Station documentation, and to information on connecting with non-Apple computers, such as those using Microsoft Windows operating systems.

VI. File Sharing

For a variety of File Sharing topics, see technical document 106657: "**Mac OS 8, Mac OS 9: File Sharing**"

VII. Using your computer in different locations

If you use your computer in different locations, the Location Manager allows you to quickly change your Internet, printer, and other location-related settings quickly from the Control Strip. Choose Mac Help from the Help menu, and search on "Location Manager" for more information.

VIII. Setting Internet preferences

You may change settings such as your email address, preferred mail application, and preferred Web browser in the Internet control panel. To access this, choose Control Panels from the Apple menu, then Internet from the submenu.

Information about products or services not manufactured or provided by Apple is for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159: "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Mac OS 9: How to Set Up Email

This document explains how to set up email.

This article has been archived and is no longer updated by Apple.

Connected to the Internet?

To set up email, your computer must be connected to the Internet. For information on connecting, see technical document 106877, "**Mac OS 9: Internet and Network Topics (Getting Connected, Troubleshooting)**".

Gather information

To set up an email account, you must gather this information from your Internet service provider or network administrator:

- type of email account you have (IMAP or POP)
- your email address
- your email account name, normally the portion of your address that precedes the "at" (@) symbol
- your password for the account
- mail server ("Host") name or names
- SMTP password (only where required, may be same as your account password)

Note: Some Internet service providers may use one mail server for both incoming (POP, IMAP) and outgoing (SMTP) mail. Others may use two. If only one server is used, then use the same server name twice where it is required by your email software. Examples of names would be "pop-mail.apple.com" and "smtp-mail.apple.com".

Choosing an email application

There are many email applications to choose from. You may have Microsoft Outlook Express or Netscape Communicator already installed on your computer. If you do not know where to find them, use Sherlock to search. Other email applications can be downloaded from the Internet or purchased as commercial products. You can search for email software at these sites:

Macintosh Product Guide
http://www.guide.apple.com

VersionTracker
http://www.versiontracker.com/
Tip: Click the Mac OS tab then search on "email client".

Setting up your account

Open your chosen email application. Many applications prompt you to complete a setup assistant the first time you use them. An assistant should ask you for the information that you have gathered. After completing a setup, you should be ready to send and receive email. If your chosen application does not include a setup assistant, check the Help menu and any other documentation that was provided to help you get you started or create new accounts.

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159: "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Mac OS X: Screen Saver Slide Show Goes Blank (or Black)

After the Screen Saver slide show begins, the screen may go blank (or black). This is because the Energy Saver settings put the computer or display to sleep.
This article has been archived and is no longer updated by Apple.

Symptom

1. The screen goes blank after a slide show starts.

2. The time required for the screen to go blank is usually the difference between the Activation setting in the Screen Saver pane of System Preferences and the Sleep setting in the Energy Saver pane of System Preferences.

Note: The system will behave the same way when third-party software is used for a slide show, and Energy Saver is set to put system to sleep or display sleep.

Example:

Activation is set to 5 minute, and Display Sleep is set to 20 minutes. After 5 minutes of computer inactivity, the slide show begins. The Slide Show is displayed for 15 minutes, then the screen goes blank.

Solution

Adjust the desired time until sleep in the Energy Saver pane of System Preferences. Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Energy Saver from the View menu.
3. Click the Sleep tab.
4. Set the sliders as desired.
5. Quit System Preferences.

Try iPhoto

As an alternative to Screen Saver, iPhoto allows you to specify the display duration for each slide, play background music, and other options. For more information, see the iPhoto product page (http://www.apple.com/iphoto/).

Apple Remote Desktop: How to Determine If 1.0.1 Update Is Installed

Apple Remote Desktop 1.0.1 Update does not update the admin application. It only updates the ARD Agent (client) portion of the software. Thus, you must check the version of the ARD Agent to determine whether the update has been installed.
This article has been archived and is no longer updated by Apple.

Symptom

After installing the Apple Remote Desktop 1.0.1 Update, both the About Remote Desktop and Info windows report that the application is still version 1.0.

Solution

This is expected behavior. The Apple Remote Desktop 1.0.1 Update does not update the Apple Remote Desktop admin application. It only updates the ARD Agent (client) portion of the software.

To determine if the Apple Remote Desktop 1.0.1 Update has been installed, follow these steps:

1. Choose Go to Folder from the Go menu.
2. Type: /System/Library/CoreServices/
3. Click Go.
4. Select ARD Agent in the Finder window.
5. Choose Show Info from the File menu.

If the version number is 1.0.1, the update has been installed.

Notes

1. You must restart after installing the update in order for it to take affect.
2. The Apple Remote Desktop 1.0.1 Update is not required and will not work on client computers running Mac OS 8 or Mac OS 9.

Mac OS X 10.1: "Error code -1000" When Burning a DVD-R Disc

If you burn a DVD from the Finder while the Classic environment is running, an alert box with an "Error code -1000" message may appear.
This article has been archived and is no longer updated by Apple.

Symptom

If you burn a DVD from the Finder while the Classic environment is running, an alert box with this message may appear:

> "Sorry, the operation could not be completed because an unexpected error occurred (Error code -1000)."

The blank DVD-R disc has not been affected and is still usable.

Solution

As a workaround, stop the Classic environment before attempting to burn a DVD-R. Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Classic from the View menu.
3. Click the Start/Stop tab, if necessary.
4. Click Stop.

This document will be updated as more information becomes available.

Mac OS X: About Microsoft Internet Explorer Version 5.1.4

Microsoft Internet Explorer version 5.1.4 resolves potential security vulnerabilities in previous versions of Internet Explorer 5.
This article has been archived and is no longer updated by Apple.
The Internet Explorer 5.1 Security Update (5.1.4) resolves potential security vulnerabilities in previous versions of Internet Explorer 5.

This update requires Mac OS X 10.1 or later, and is available only through the Software Update feature of the System Preferences application. For more information on updating software, see these technical documents:

106704: "**Mac OS X: How to Update Your Software**"
106713: "**Mac OS X: Chart of Available Software Updates**"
106692: "**Mac OS X: Troubleshooting Installation and Software Updates**"

Mac OS X Mail: Can‘t drag name (vCard) from Address Book to "To:" or "Cc:" message field

You can drag an Address Book name entry (also referred to as a vCard or "contact") to a Mail message "To:" or "Cc:" field by first selecting a different field. This document applies to Mac OS X 10.2.8 and earlier.
This article has been archived and is no longer updated by Apple.
Select a different message field before dragging the vCard from Address Book. For example, click the subject field before dragging the vCard to the "To:" or "Cc:" field.

Mac Tutorial: Does Not Work With Mac OS X Mac Help

Start up from Mac OS 9 to view Mac Tutorial content within Mac Help.
This article has been archived and is no longer updated by Apple.

Symptom

Mac Tutorial files do not work when using Mac OS X Mac Help.

Solution

Use Mac Help for current information about your computer. Start up from Mac OS 9 before using Mac Tutorial (within Mac OS 9 Mac Help).

Mac OS X Update 10.1.5: Enhancements and "Before You Install" Information

Mac OS X Update 10.1.5 addresses certain issues and updates system software.

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X (version 10.1, 10.1.1, 10.1.2, 10.1.3, or 10.1.4) to version 10.1.5.

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Users from the View menu. Select and Admin user and click Edit User. Click the Password tab. Change the password and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If you experience a power outage or other interruption during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. Prerequisite software must be present before you can install Mac OS X Update 10.1.5, whether you are using Automatic Software Update or standalone installers. Updates must be installed in the correct order. For the correct sequence, see technical document 106713, "**Mac OS X 10.1: Chart of Available Software Updates**".

Installation

There are two ways to update to Mac OS X 10.1.5.

I. Automatic Software Update Installation

See technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

II. Standalone Installer

Standalone installers are available from Apple Software Downloads (http://www.apple.com/swupdates/). Two versions are available. See technical document 106713, "**Mac OS X 10.1: Chart of Available Software Updates**".

Do not reinstall earlier Mac OS X updates

You should not reinstall certain earlier updates after using this update, including:

- Mac OS X 10.0.1
- Mac OS X 10.0.2
- Mac OS X 10.0.3
- Mac OS X 10.0.4
- Mac OS X 10.1
- Mac OS X 10.1.1
- Mac OS X 10.1.2
- Mac OS X 10.1.3
- Mac OS X 10.1.4
- Security Update 10-19-01
- Installer Update 1.0

Updates should be installed in the correct order. If for any reason you need to reinstall an earlier software update, the Mac OS X startup volume should be erased, after first backing up important documents and data. Reinstall Mac OS X, and install necessary updates in the correct order.

Enhancements Delivered with this update

In addition to enhancements previously delivered with Mac OS X 10.1.1, 10.1.2, 10.1.3, and 10.1.4, the Mac OS X 10.1.5 update includes the following:

Networking, Mail, and Internet Connectivity Enhancements

- A mail account will go offline if a secure connection to a remote SSL mail server cannot be made (when the SSL encryption option is enabled).
- Improves robustness when accessing files and directories on Microsoft Windows-based servers.
- Resolves a potential Mail issue in which mailbox draft messages (besides the first) could be inadvertently deleted when using Rebuild Mailbox.
- Enhances the security of sendmail (a mail function in the Darwin subsystem unrelated to Mail.app).
- Improves compatibility when accessing a WebDAV volume via a non-standard http port.
- Improves function of certain kinds of WebDAV DNS lookups via an AirPort Base Station (Graphite).
- Permits communications with WebDAV servers that use long http header lines.
- Reduces time required to list iDisk and WebDAV server directories.
- Improves buffer efficiency during WebDAV downloads.
- Improves WebDAV compatibility with servers that use chunked transfer-coding.
- Addresses a potential kernel panic situation that could occur when saving a file stored on an iDisk or WebDAV volume.
- Traditional Chinese text now appears when expected within Internet Connect (AirPort configuration).
- Improves general reliability of Mail.
- Adds a man page for mount_webdav (man pages are accessible when using the Terminal man command).

Device Compatibility Enhancements

- Includes newer Adaptec SCSI card drivers (version 1.1.0) for Apple Ultra SCSI PCI cards and Apple 2906 SCSI PCI cards.
- Addresses an issue in which a SCSI-based magnetic-optical drive may inadvertently report media as write protected when it is not.
- Improves compatibility with certain Canon digital cameras.
- Improves reliability when deleting multiple images from certain Nikon digital cameras.
- Improves reliability of audio applications when a USB MIDI device is disconnected and reconnected.
- Improves PC card (generic serial communications) support, enhancing potential compatibility with third-party PC slot communications cards.
- Reduces likelihood that a non-recommended display resolution and refresh rate could be chosen (resulting in a persistent black screen), when using certain Power Macintosh G4 (QuickSilver) computers with an AppleVision 750 or AppleVision 1710 display.
- Improves compatibility of Power Macintosh G3 (Desktop and Mini Tower) computers with ATI Radeon 7000 video cards.
- Adds support for LaCie Pocket CD-RW devices 16-10-40 U&I, and 8824 U&I
- Improves iSub frequency cutoff range.
- Resolves a potential solid screen color issue, when using an nVidia GeForce 3 video card in a computer with 1 GB of RAM installed.
- Addresses various other potential nVidia video card issues.
- When using certain USB speakers, a mute setting is preserved more reliably after waking from sleep.

Application-related Enhancements

- Reduces the time required to open optimized applications that use embedded frameworks.
- Addresses a potential stall issue that could occur while iTunes was finishing a CD burn.
- Enhances stability of Sherlock.
- Adds Image Capture support for certain recently-introduced Canon USB cameras.
- Addresses an isolated issue in which a Hanja text conversion could fail when using Korean Input Method.
- Improves Korean Input Method (Hanja) compatibility with AppleWorks 6.2.
- Improves Korean Input Method (Hanja) compatibility with Adobe Photoshop 7.0
- fsck_hfs (file system check) now works with Mac OS Extended format volumes larger than 1 TB.
- Addresses various potential Apple DVD Player issues.

Finder, Sleep, and System Settings Enhancements

- Energy Saver now offers an advanced option, on compatible portable computers, to increase battery life by reducing processor performance while the computer is not used.

- Resolves a potential issue in which audio may have become muted after waking from sleep.
- The Sound preference pane may now be opened by pressing a Option-Volume key combination on an Apple Pro USB Keyboard.
- Addresses a potential situation in which the Finder may inaccurately report less available space on a blank disc, after ejecting a disc instead of burning new data to it.
- Additional support for 2D and QuickTime hardware acceleration for Rage Pro, Rage Pro Turbo and Rage Mobility.
- Addresses various potential video mirroring issues.

Mac OS X Server: How and When to Use repairDB for Mail Database Maintenance

In some situations, you may need to use a mail database repair utility that is accessible via the command line.
This article has been archived and is no longer updated by Apple.
Under most circumstances, the Mac OS X Server mail server automatically detects mail database issues and automatically runs a repair utility to correct them. In some situations, the issues are not detected and repair does not happen automatically.

To run repairDB:

1. Stop Mail Service using Server Admin (10.1) or Server Settings (10.2).
2. Open Terminal (/Applications/Utilities/).
3. At the prompt, type one of the following commands, as indicated for server versions 10.1 and 10.2.

   For Mac OS X Server 10.1:

   ```
   sudo /usr/sbin/MailService -repairDB
   ```

   For Mac OS X Server 10.2:

   ```
   sudo /usr/sbin/MailService -compressDB
   ```

4. Press Return.
5. Enter your Admin user password.
6. Press Return.

The repair utility runs. The status of the utility is reported in:

/Library/Logs/MailService/AppleMailServer.Repair.log

Upon completion of the database repair the following lines appears in AppleMailServer.Repair.log:

--- Finished mail database recovery --- Closing the new mail database

Now, you need to kill the MailService process and restart mail service:

1. At the prompt, type: `top`
2. Press Return.
3. In the resulting list, locate the process ID (PID) of the MailService process.
4. Press the "Q" to leave top and get a new prompt.
5. Type: kill <PID>
Note: Where the example says "<PID>", type only the actual number, for example, "kill 123".
6. Press Return.
7. Restart mail service

AppleWorks 6.2.4: Dictionary Preferences Have Changed for Some Localized Versions

The Danish, Norwegian, Finnish, and Brazilian Portuguese versions of the AppleWorks 6.2.4 Update change the spelling dictionary and thesaurus preferences.

This article has been archived and is no longer updated by Apple.

Danish

AppleWorks 6.2.4 does not include a Danish spelling dictionary and instead includes an English spelling dictionary. Updating to version 6.2.4 will change your spelling dictionary preference to English.

Norwegian

AppleWorks 6.2.4 does not include a Norwegian spelling dictionary and instead includes an English spelling dictionary. Updating to version 6.2.4 will change your spelling dictionary preference to English.

Finnish

AppleWorks 6.2.4 does not include a Finnish spelling dictionary or a Finnish thesaurus and instead comes with an English spelling dictionary and thesaurus. Updating to version 6.2.4 will change your spelling dictionary and thesaurus preferences to English.

Brazilian Portuguese

AppleWorks 6.2.4 does not include a Portuguese thesaurus and instead comes with an English thesaurus. Updating to version 6.2.4 will change your thesaurus preference to English.

Published Date: Feb 17, 2012

Mac OS X: Icons Appear Stacked Upon Each Other, Cannot Be Moved

Icons in a Finder window or on the desktop may appear stacked upon each other. They cannot be moved, and when you try to sort the icons or clean up the desktop, it does not work. Upgrade to Mac OS X 10.2 to avoid the issue.
This article has been archived and is no longer updated by Apple.

Symptom

Icons in a Finder window or on the desktop appear stacked upon each other and cannot be moved.

Additional information

This issue may occur when a folder has valid Mac OS X placement information (.DS_Store file) and files in the folder have valid Mac OS 9 placement data (stored in the HFS file system). Deleting the .DS_Store file helps, but only until the files are again changed in Mac OS X.
Published Date: Feb 17, 2012

Mac OS X Server: How To Adjust The NetBoot Client Aging Time

This document explains how to adjust the aging time of the NetBoot AFP User Binding in order to allow a greater number of NetBoot clients to access the NetBoot server.
This article has been archived and is no longer updated by Apple.
NetBoot clients bind to the NetBoot server using an AFP User as part of the NetBoot process. There are a finite number of AFP User bindings available to NetBoot clients in order to provide the optimal mix of network performance and number of clients.

It is possible to adjust the interval at which the AFP bindings can be reclaimed and used for another NetBoot client upon startup. In larger installations, adjusting this interval or aging time below the default setting of 24 hours (86400 seconds) provides NetBoot clients with "reclaimed" AFP bindings with greater frequency. This strategy can be used to effectively increase the number of NetBoot clients that can be served by a NetBoot server.

The default aging time for a NetBoot client is 24 hours. This can be modified by setting the NetInfo property: age_time_seconds

This property is in the local NetInfo domain in the "config" property at: /config/NetBootServer.

The main reason why aging/reclamation was added was to solve the issue of NetBoot client turnover. For example, suppose 50 NetBoot clients were started up initially, then two of the clients were removed or replaced with two other units. Without aging/reclamation, the administrator would need to manually reset the bindings in order to be able to NetBoot 50 clients again.

A NetBoot client that has not started up in the last interval of time as defined by "age_time_seconds" may have its AFP user binding reclaimed. If the server runs out of AFP User logins when servicing a NetBoot request, it may reclaim an AFP User login from one of the other NetBoot clients that has already started up. The reclamation process does not disrupt any existing, started up NetBoot systems as long as they remain turned on.

The side effect of setting the aging time to a very small value (5 minutes, for example) means that it is pretty easy to end up with multiple clients using the same AFP login, thus increasing the number of clients that the NetBoot server will serve. However, should all NetBoot clients that are currently started up from the NetBoot server restart simultaneously, they will still be limited by the maximum number of AFP logins. The maximum number of AFP logins is set in the property afp_users_max (also in /config/NetBootServer).

The preferred method of modifying the aging/reclamation value in the NetInfo database is using the niutil command in the terminal application. NetInfo Manager can also be used to modify these properties and values.

If you wish to change these settings, follow these steps:

1. Open Terminal (/Applications/Utilities).
2. Type: `niutil -create . /config/NetBootServer`
Note: If the directory already exists, this command is unnecessary. Go to the next step.
3. Press Return.
4. Type: niutil -createprop . /config/NetBootServer age_time_seconds 300
Note: Be sure to calculate the time in seconds. In this example, 300 seconds gives you a five minute age time. You may substitute another value.
5. Press Return.
6. Quit Terminal.

For more information see, technical document 122015, "**Mac OS X Server Administration Guide: Manual**".

Mac OS X Server: How to Keep Shared Disk Images Mounted

Disk images are unmounted (or "ejected") when you log out of Mac OS X Server. This document explains how to keep the images mounted after the Admin user logs out.
This article has been archived and is no longer updated by Apple.

Symptom

A shared disk image volume becomes unavailable to users after you log out of the server.

Solution

Terminology

"Mounting" is the process by which a disk is made available for use in the operating system. For actual disks this occurs automatically at startup in Mac OS X. In the context of a disk image file (.dmg), "mounting" is when the file is made to behave as if it were an actual disk. This occurs when you open disk image file or drag it into the Disk Copy window. Disk Copy then "mounts" the image, after which it behaves in the Finder as if it were an actual disk. Though disk images are not literally "ejected," the term is used interchangeably with "unmount".

How to mount a disk image as root

Disk images mounted by a normal user (Admin or non-Admin) are unmounted when that user logs out. If you wish an image to remain mounted so that it may be a shared volume, mount it as the root user.

Follow these steps to mount a disk image as the root user:

1. Log in to the server as an Admin user.
2. Be sure that the disk image you wish to use as root is not already mounted.
3. Place the disk image in your Documents folder.
Note: You may place the image elsewhere, but you would need to adjust the pathname accordingly in Step 5.
4. Open the Terminal application (/Applications/Utilities/).
5. Type: `sudo hdid ~/Documents/<disk image file name>`

   Note: You would replace "<disk image file name>" with the actual name of the disk image. For an image named "Apple.dmg", you would type:

   ```
   sudo hdid ~/Documents/Apple.dmg
   ```

6. Press Return.
7. Enter the Admin user password when prompted, then press Return.

The disk image is mounted as a root user process. It is not unmounted when you log out.

Note: If you log in to the server as the root user at a later time, any disk images you opened as root user processes are unmounted when you log out. You would need to repeat these steps to make the images available when log in as your Admin user.

How to unmount a disk image as Admin

While logged in as your normal Admin user, you may use these steps to unmount a disk image that has been mounted as root.

1. Open the Terminal (/Applications/Utilities/).
2. At the prompt, type: `mount`
3. Press Return. This shows you a list of mounted disks and disk images. Each line represents one mounted disk and contains two components separated by the word "on". Preceding "on" is a device name reference, and following "on" is the pathname of the mounted disk as it would appear in the Finder. Following the pathname component is a parenthetical description of its state, which you may ignore. For a mounted disk image named "apple.dmg" that is stored on the server's startup volume, the list output could be:

   ```
   /dev/disk1/ on /Volumes/apple (local, nodev, nosuid, read-only)
   ```

   In this example, the device name would be:

   ```
   /dev/disk1
   ```

   Note that the second solidus (slash) that appears in the original output is not part of the device name.

4. Locate the line that contains the name of the disk image you wish to unmount.
5. Type: `sudo hdiutil eject <device_name>`

Using the example device name above, what you should type would look like this:

```
sudo hdiutil eject /dev/disk1
```

6. Press Return.
7. Enter your Admin user password when prompted, and press Return.

Published Date: Feb 20, 2012

Mac OS X: How to Save a Finder View (Column, Icon, or List) for a Specific Folder or Disk

The Finder saves the preferred view (Column, Icon, or List) of the first folder or disk opened in a new Finder window.
This article has been archived and is no longer updated by Apple.

Symptom

You open a new Finder window and then navigate to another folder or disk in the same window. You set the window to a different view and then close the window. The next time you open that folder or disk, it has reverted to the previous view.

Note: This symptom is not apparent if you have selected the Finder preference "Keep a window's view the same when opening other folders in the window". The symptoms occurs if you deselect this preference.

Solution

Concept of "starting point"

The Finder always saves the preferred view of the first item opened in a new Finder window. The item may be a disk, folder, or the "Computer" list of volumes. This first item opened in a new Finder window is known as that window's **starting point**. The starting point is also the only place where the window position, scroll position, and window size are saved.

Temporary versus "preferred" view setting

By default, the Finder opens items in the same window as you navigate through disks and folders. The Finder does not save the view of any item opened subsequent to the starting point. Since the subsequent items' views are not saved, this allows you to set a preferred view for an item that you may change temporarily during a session of browsing in the Finder. After you close the Finder window, the item reverts from the temporary setting to your preferred setting.

How to set a preferred view

There are several ways you may open a given item in a new Finder window for the purpose of saving a view, but this method is the simplest. Follow these steps:

1. Close open Finder windows.
2. Click the Finder icon in the Dock.
3. Choose Preferences from the Finder application menu.
4. Click "Always open folders in a new window" to enable that option.
5. Open the item for which you wish to set a view. It should appear in its own new window.
6. Set the desired view in the new window.
7. Close the new window.
8. Repeat Steps 5 to 7 for any item you wish to set.
9. If desired, click "Always open folders in a new window" to disable that option.
10. Close the Finder Preferences window.

Note: When saving a List view, the sort order (such as by Date Modified or Size) may not be consistently retained. See technical document 106204, "**Mac OS X 10.1: List View Settings May Not Be Retained**".

Macintosh Manager: About the Hand Out Feature

This document describes the circumstances in which a Macintosh Manger administrator may use the Hand Out feature to push files out to the members of a workgroup.
This article has been archived and is no longer updated by Apple.

About the Hand Out feature

A Macintosh Manager administrator can hand out files to members of the currently active workgroup, or to specific users that belong to the active workgroup (Figure 1). This feature is only available when logged in as a Macintosh Manager administrative user, either a Workgroup Administrator or a Global Macintosh Manager Administrator. When logged in to a Panels environment, this feature is found in the File menu. If the Hand Out command is dimmed, bring the Documents Panel to the foreground to make it available.

Note: The Hand Out feature is not available in the Finder or Restricted Finder environments, only from the Panels environment.

Figure 1 The Hand Out dialog

Where Handout items appear

Items handed out are copied to a Handouts folder, which is automatically created in the user's Documents folder as needed.

When Handout items appear

Handout items are copied to users' Documents folders when they log in to the workgroup that handouts were given to. A user who logs in to different workgroups does not receive a handout until he logs in to the specific workgroup. After the handouts are copied to a user's Documents folder, they are available to be used in any workgroups the user has access to.

Replacing items

When handing items out, you have the option to replace items with the same name. When this option is selected, a confirmation dialog appears to verify your wish to replace the files (Figure 2). If you choose to replace the files under Macintosh Manager 1.4.1, the files will be replaced. If you choose to replace the files under Macintosh Manager 2.0 and later, the existing files will be renamed and the new files will have the desired names.

Figure 2 Replace confirmation dialog

Disk quotas

When handing out items to members that have exceeded their disk quota, the handed out files will not be copied to the users' Documents folders. These users must be allowed more disk space on the server, or they must delete data from their Home directories to get below the quota.

Macintosh Manager 2: How to Gain System Access

This document discusses which users may gain system access at Macintosh Manager client computers.
This article has been archived and is no longer updated by Apple.
There are multiple ways a user can gain System Access at a Macintosh Manager client. Users can press the Command-Shift-Escape key combination while at the login window, or select Finder when the Macintosh Manager Authentication Server cannot be found (Figure 2, below). In either case, the user is asked to authenticate to gain system access (Figure 1).

At the Macintosh Manager administrator's option, specific users may also be granted System Access. When this option is enabled, users see System Access as an available Workgroup while logging in. No other authentication is required.

Figure 1 "Enter Name and Password" dialog

When prompted for a name and password after pressing Command-Shift-Escape, the following is accepted:

- a Macintosh Manager Global Admin name and password
- the client computer's owner password only

When prompted for a name and password after pressing Command-Shift-Escape, the following are **not** accepted:

- a Macintosh Manager Workgroup Administrator name and password
- a Mac OS X Server Admin user name and password

Note: A Mac OS X Server Admin user may also be a Macintosh Manager Global Admin. If this is the case, the user will be able to gain System Access.

If the Macintosh Manager authentication server cannot be found, one of the options is to open to the Finder (Figure 2).

Figure 2 "Cannot locate server" dialog

When prompted for a name and password to gain System Access when the server cannot be found, the following is accepted:

- the client computer's owner password only

When prompted for a name and password to gain System Access when the server cannot be found, the following are **not** accepted:

- a Macintosh Manager Global Admin name and password
- a Macintosh Manager Workgroup Administrator name and password
- a Mac OS X Server Admin user name and password

Mac OS X Server: Some Mac OS 8.6 to 9.1 AppleShare (AFP) Clients Seem Slower Than Others

You may notice that read-write communication and performance is relatively slow between Mac OS X Server computers and Mac OS 8.6 clients.
This article has been archived and is no longer updated by Apple.

Symptom

Mac OS 8.6 clients experience slower observed AFP network throughput when connecting to Mac OS X Server 10.0.3 or later.

Solution

You should upgrade earlier systems to Mac OS 9.2.2.

Alternative workaround

If for any reason you cannot upgrade to Mac OS 9.2.2, you may use the following workaround.

Warning: The following workaround improves performance, but it has not been fully tested and qualified by Apple Computer. Therefore, the workaround is provided by Apple on an "AS IS" basis. AS PERMITTED BY APPLICABLE LAW, APPLE EXPRESSLY DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, AS TO ANY MATTER WHATSOEVER RELATING TO THE USE OF THE WORKAROUND, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, AND IN NO EVENT SHALL APPLE BE LIABLE FOR ANY INDIRECT OR CONSEQUENTIAL DAMAGES AS A RESULT OF SUCH USE. Technical support cannot be provided for any potential complication that arises from using the following workaround. Use of the workaround is at your own risk. Possible consequences of an unqualified network configuration include data loss.

Follow these steps:

1. Go to Apple Software Downloads (http://www.apple.com/swupdates/).
2. Download Apple Ethernet Update 2.0.
3. Double-click the disk image file (.smi). The disk Apple Ethernet Update 2.0 appears on the desktop, or in the Computer directory if you are performing this step in Mac OS X.
4. In the disk Apple Ethernet Update 2.0, navigate to:

   /Installer Files/Ethernet/Installer Files/

5. Here you find Apple Enet extension version 2.4.3. Copy this to your hard disk.
6. Copy Apple Enet 2.4.3 to the Extensions folder of any Mac OS 8.6 to 9.1 client system.

Mac OS X: Kernel Panic When Using PC Card Modems

Mac OS X 10.1.5 introduced a generic PC card modem driver for a variety of PC card modems. However, if after using the modem one switches to a network location for which the PC card modem port is not active, a kernel panic can occur and the computer will need to be restarted.

This article has been archived and is no longer updated by Apple.

Symptom

A kernel panic occurs when you switch network locations or when you eject a PC card (PCMCIA) modem. If you need help identifying this symptom, see technical document 106227, "**Mac OS X: What is a Kernel Panic?**".

Solution

This resolved in Mac OS X 10.2 or later. Users of Mac OS X 10.1.5 may use the following workaround.

For each network location you use, enable the port for the PC card modem. Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Network from the view menu.
3. Choose the desired location from the Location pop-up menu.
4. Choose Active Network Ports from the Show menu.
5. Be sure that the checkbox is selected for the PC card modem. The name of the port should be "pccard-modem-port" or something similar.

Alternatively, you may eject the PC Card modem while the computer is in sleep mode.

Mac OS X: Loss of Network Connectivity After Updating to Mac OS X 10.1.5

After installing Mac OS X Update 10.1.5, your computer may lose its network or Internet connection.
This article has been archived and is no longer updated by Apple.

Symptom

Your computer does not connect to the Internet, or to your local area network (LAN). This is noticeable immediately after startup. You may also notice one or both of these symptoms:

1. IP address, subnet mask, and router address have all been set to "255.255.255.255".
2. DHCP configuration is not available as a choice in the Network preference pane.

Solution

Install Network Update 1.0. For information and software download, see technical document 106922, "**Mac OS X: About Network Update 1.0**".

If the issue persists, follow these steps:

Important: You must be logged in as an Admin user.

1. Click the Finder icon in the Dock.
2. Choose Go to Folder from the Go menu.
3. Type: `/Library/Preferences/`
4. Click Go.
5. In the Finder window, locate the file named: com.apple.PowerManagement.plist
6. Drag this file to the Trash.
7. Restart the computer.

Mac OS X: Issues after removing "etc" and/or "var" directory alias when started up from Mac OS 9

This article has been archived and is no longer updated by Apple.

Aliases to the "etc" and "var" folders may be visible when started up from Mac OS 9. These aliases shouldn't be removed.

This document applies to Mac OS X 10.1.5 or later.

When starting up in Mac OS X after having been started up from Mac OS 9, one or more of these symptoms occurs:

- The computer stops responding during startup.
- The Setup Assistant reappears.
- BSD commands that access files in etc and var fail.
- An alert box appears with a message that contains:
  "/etc/master.passwd: no such file or directory".

Do not delete the "etc" or "var" aliases, or any other Mac OS X-installed files or folders that are visible when started up from Mac OS 9. See "Mac OS X: "Broken Folder" Icon, Prohibitory Sign, or Kernel Panic When Computer Starts Up".

If these items were deleted, use these steps:

1. Start up in single-user mode.
2. Type: `mount -uw /`
3. Press Return.
4. Type: `ln -s /private/etc etc`

   If this alert appears: "File already exists," execute the following command, then repeat the last step:
   `mv /etc /private/tmp/etc.delete`

5. Press Return.
6. Type: `mv /var /var.delete`
   There is a space between "/var" and "/var.delete".
7. Press Return.
   Tip: If you see the message "No such file or directory," make sure that the spacing and spelling are correct, then repeat the last two steps. If you still see this message after the second attempt, continue to the next step.
8. Type: `ln -s /private/var var`
9. Press Return.
10. Type: `ls -l | grep ">"`
    The character before "grep" is a pipe character ("|"), which is usually located above the Return key.
11. Press Return.

    Look for these two items in the output:

    ```
    lrwxrwxr-t Â 1 root Â admin Â {date} etc -> private/etc
    lrwxrwxr-t Â 1 root Â admin Â {date} var -> private/var
    ```

    If any of these are not present, repeat the necessary steps above until they are.

12. Type: `reboot`
13. Press Return.

If you still can't start from Mac OS X, see Mac OS X: Troubleshooting a startup issue.

TA20809_Mac_OS_X_Issues_after_removing_etc_andor_var_directory_alias_when_started_u

Published Date: Feb 17, 2012

Mac OS 9: Troubleshooting Printer Installation Issues

This document discusses troubleshooting issues that may arise when installing printer software.
This article has been archived and is no longer updated by Apple.

Symptom

Printer software will not install. You may see alert boxes with messages similar to the following:

"There is not enough memory to use the Installer."
"There is not enough disk space to use the Installer."
"The file system cannot be modified."
"The item <name> cannot be replaced."

Solution

Software version and compatibility

Be sure that the printer is compatible with the version of Mac OS 9 that you are using. Check the printer manufacturer's Web site for later versions of the printer drivers than those included in the box with the printer. If later versions exist, it is normally best to use them instead of the ones included in the box. Some printers may also require firmware updates that would be available at the manufacturer's Web site.

Check for instructions, "Read Me" file

Be sure to follow the installation instructions included with the software. If using a later version that you downloaded, be aware that any "Read Me" file included with the download may supersede what was included in the printer box.

Turn off security software during installation

Depending on what kind of security and virus-protection you use, you may need to turn it off while you install software. Even if your security software allows per-incident installation authorization, you may still need to turn it off to eliminate the possibility that it is interfering.

Isolate hardware

Isolate the computer hardware to eliminate the possibility that another device is interfering. Disconnect all peripherals and third-party hardware. Use only the Apple keyboard and mouse included with the computer.

Check for extension conflict

To check for an extension conflict, open the Extensions Manager control panel and select the Mac OS 9 Base set, then restart the computer. Try installing the software again. Afterward, you need to reopen the Extensions Manager and go back to the set you were using before (most likely "My Settings"). See technical document 30929, "**Mac OS: Extension Conflict Troubleshooting/Extensions Manager Features**".

Check the installation CD

If installing from CD, make sure the disc is not dirty or scratched. Clean the data side of the disc by using a dry, lint-free cloth to gently wipe the CD from the spindle hole to the outer edge. Do not wipe in a circular fashion. If you have a CD-ROM lens cleaner disc, use that to clean the drive.

Record alert messages for reference

If you see an alert box with a message during installation that is not discussed below, write down the message for reference when seeking technical support.

"Not enough memory to use the Installer"

If you are trying to use an installer that is on your hard disk and see the message "There is not enough memory to use the Installer," make sure the computer is started up from the hard disk, and it is the selected volume selected as the destination disk when installing.

"Note enough disk space"

If you see a message that "There is not enough disk space," make more space available on your hard disk by deleting some files from the disk. Copy the files you want to keep to another disk, then drag them to the Trash and choose Empty Trash from the Special menu to delete the files.

"File system cannot be modified"

If you see a message that "The file system cannot be modified" or "Installation was not successful," make sure any security and virus-protection software is turned off.

"The item cannot be replaced"

If you see a message that "The item <name> cannot be replaced," the installer is attempting to replace a file, but there is a folder on the disk that has the same name as the file being replaced. (Files cannot replace folders.) Find the folder on your disk and rename it, then try the installation again.

Clean installation

If nothing else has resolves your issue, perform a clean installation of Mac OS 9. If you are installing from a Mac OS 9 CD that did not come with your computer, the version number printed on the disc (such as 9.0.4) must be later than the version of Mac OS that was originally included with your computer. To learn about clean installation, see technical document 58176, "**Mac OS 8, Mac OS 9: Performing a Clean Installation**".
Published Date: Feb 18, 2012

Mac OS: Video Game Quits Unexpectedly After Changing Display Resolution

When a video game switches to a resolution that is not compatible with your display, the game may quit unexpectedly. When you try to open the game later, it may quit immediately, or not open, and no alert box appears.

This article has been archived and is no longer updated by Apple.

Symptom

After changing display resolution in a video game, an alert box with this message (or a similar one) appears:

- "The application <game name> has unexpectedly quit."

When you try again, the game will not open successfully.

Note: This issue may occur with other types of applications that switch the display resolution.

Products affected

- Mac OS 9
- Mac OS X
- Macintosh-compatible video games
- Other applications that switch display resolution

Apple flat panel displays, such as:

- Apple Cinema HD Display
- Apple Cinema Display
- Apple Studio Display 17 (ADC)
- Apple Studio Display LCD (ADC)

Apple computers with built-in flat panel displays, such as:

- PowerBook G4
- iBook
- iMac (Flat Panel)

Solution

This issue occurs when a video game switches to a screen resolution that is not compatible with your display. This does not mean that something is wrong with your display or with the game. Rather, it shows the difference between the very large number of possible display resolutions (those available to any display which a consumer may feasibly use) and the relatively small number of choices that a game manufacturer can put into a menu within the game.

Game resolution background information

Most games contain a list of resolutions that are likely to be compatible with a wide range of multiple scan cathode-ray tube (CRT) displays. The most commonly used resolutions in recent years have been 640 by 480, 800 by 600, and 1024 by 768. The rise of flat panel displays has added resolution possibilities for gamers that were not "traditional" gaming choices in the past. A flat panel display offers its best image quality at its maximum or "native" resolution, though most can also simulate other resolutions through scaling, a method in which multiple pixels are grouped to appear as one. For these reasons, a flat panel display may work with fewer resolutions than a multiple scan CRT. So, you are more likely to notice this issue on a fixed resolution CRT or on a flat panel display than you are on a multiple scan CRT monitor.

Getting the game to open

A. Locating the preference, configuration, or initialization file

The immediate issue you must address is getting the game to open again. For most games you can do this by locating the file that contains the resolution setting. The file usually takes one of these two forms:

- 1. a **preference** file
  Some games store the resolution setting in a preference file. In Mac OS X, preference files are stored at:

  /Users/username/Library/Preferences/

  In Mac OS 9, these files are stored at:

  Macintosh HD: System Folder: Preferences:

  The name of a preference file usually contains the name of the game or application.

  2. a configuration (**.cfg**) or initialization (**.ini**) file
  Other games store the resolution in a "configuration" or "initialization" file. These files can be identified by the filename extensions ".cfg" and ".ini" respectively. Configuration files are usually found in the same folder as the application, or in a subfolder of the applications folder. Below are two example locations.

  For Return to Castle Wolfenstein (id Software/Aspyr Media) installed in the Mac OS X Applications folder:

  /Applications/Wolfenstein/Main/wolfconfig.cfg

  For Unreal Tournament (Epic Games/MacSoft) installed on Macintosh HD in Mac OS 9:

  Macintosh HD: Unreal Tournament: UnrealTournament.ini

Note: Filename extensions other than ".cfg" and ".ini" may be used. Look for any conspicuous text file that contains game settings that is stored in the game application folder. The ".cfg" and ".ini" extensions are used by games that use the Quake III and Unreal game engines, respectively.

B. Corrective action

If you find that your game uses a .cfg or .ini file, try addressing them before you do anything with preferences. If you had not made many custom settings to the game before the issue occurred, you may wish to simply drag the file to the desktop and then reopen the game. When you reopen the game, it should create a new .ini or .cfg file that contains default settings.

If you have made extensive customization to game settings prior to the issue occurring, it is likely that some of them are stored in the .cfg or .ini file. Rather than moving the file, you may wish to edit it.

- 1. Save a copy of the file for reference.
  2. Open the file in TextEdit (Mac OS X) or in SimpleText (Mac OS 9). These files are usually several hundred lines long, but spotting the display resolution is easily done. Look for two lines of text next to each other that contain the last resolution numbers that you used or chose in the game. These lines may contain key word such as "horizontal","vertical,""x", and "y". The "x" and "y" refer to horizontal and vertical axes. Change the resolution numbers to 640 (horizontal) by 480 (vertical). This is a default resolution for many games that will work with most displays currently in use
  3. Save your changes.
  4. Reopen the game.

If the game does not use any kind of configuration file, then drag the preference file from its original location to the desktop. When you reopen the game, it may reset to the default resolution. You may lose custom settings that you have made in the game.

If neither of these methods works for you, check any support information provided by the game maker.

Preventing the issue from recurring

The best way to prevent the issue from recurring is to read all of the documentation that came with the video game. Most game makers are aware of resolution issues, and often solutions are described in the "read me" documents that accompany software. Look for advice on how to create a "custom" resolution. Additionally, you should look for Web sites devoted to the video game, where you may find answers to common questions.

For some games, you need to choose the desired resolution before opening the game, using System Preferences (Mac OS X) or the Monitors control panel (Mac OS 9). Other games require that you enter a special command while the game is running, or that you modify a .cfg or .ini file. You may see other methods, too.

Using Return to Castle Wolfenstein as an example, the "read me" document provides four commands that you can type in the game to switch to your desired custom resolution. An option like this is especially useful if you have a PowerBook or Apple Cinema Display, both of which have native resolutions that are not included in some games.

Choosing a resolution

You should choose resolutions that are listed in the Displays pane of System Preferences (Mac OS X) or in the Monitors control panel (Mac OS 9). Resolutions that appear dimmed (available but not recommended) may often be used successfully with video games.

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Macintosh Manager: How to Enable or Disable Virtual Memory

This document discusses how to enable or disable Virtual Memory within a Macintosh Manager environment.
This article has been archived and is no longer updated by Apple.

Symptom

- Some applications work better with Virtual Memory enabled, and others work better with it disabled.
- Macintosh Manager does not allow user access to the Memory control panel to change these settings.

Solution

If you want users to have a choice between Virtual Memory or no Virtual Memory, follow these steps:

1. Enable Virtual Memory at the client computer. The default state of the computer will be that Virtual Memory is on when the computer starts up.

2. When a user needs Virtual Memory to be disabled, restart the computer while pressing the Command key. This temporarily disables Virtual Memory until the next time the computer is restarted.

Published Date: Feb 17, 2012

AppleShare IP 6: File "In Use" or "Open" Alert Message

This document describes when you might see a message that a file on an AppleShare IP server is in use or already open.

This article has been archived and is no longer updated by Apple.

Symptom

When you try to use a file on an AppleShare IP server, an alert box appears with a message that the file is already open or in use.

Solution

Generally, when a file is opened, the application that opened it marks it as "in use." When so marked, another user may not be able to open the file until it is released.

For example: AppleWorks indicates that a file is locked or in use then asks if you would like to open a copy of the document (Figure 1).

Figure 1 AppleWorks "in use" dialog

SimpleText indicates the document may already be open and that it cannot be opened by someone else at the same time, see Figure 2.

Figure 2 SimpleText "in use" dialog

If a client computer is working on a document that resides on an AppleShare IP File Server and the client unexpectedly disconnects, the document is still marked as "in use" and will not be released initially.

AppleShare IP release such a file after two minutes of inactivity. If the files are not released, you should troubleshoot for possible drive or file damage on the AppleShare IP server.

Published Date: Feb 17, 2012

AirPort 2.0.4: How to Use the DHCP Message Feature

AirPort 2.0.4 introduces a DHCP messaging feature that can provide a message to DHCP clients that connect to the base station.
This article has been archived and is no longer updated by Apple.
With AirPort software version 2.0.4 you can set up a DHCP messaging feature that sends a message, such as network information or a greeting, to connecting DHCP clients (see Notes 1 and 2).

How to Set Up DHCP messaging

Follow these steps:

1. In Mac OS X, open AirPort Admin Utility version 2.0.4.
2. Click the Network tab.
3. Enter the message or greeting in the Message field, which appears in the lower right corner (Figure 1).

Figure 1 The Network pane of AirPort Admin Utility

4. Click Update (see Note 3).

Once the base station has been updated, any Mac OS 9 client connecting to the base station will see the message when it receives its IP address via DHCP from the base station (Figure 2).

Figure 2 A DHCP message in Mac OS 9

Notes

1. Only Mac OS 9 clients will see DHCP messages.

2. Only the AirPort Base Station (Dual Ethernet) can be configured to use this feature.

3. The message must be 253 characters or less. If you click Update with more than 253 characters, an alert box with this message appears:

"The DHCP message cannot be more than 253 characters. Please remove <number> or more characters and try again."

Published Date: Feb 19, 2012

AirPort Base Station (Dual Ethernet): Mac OS 9 AirPort Admin Utility Does Not Work After Updating to AirPort 2.0.4

After configuring an AirPort Base Station (Dual Ethernet) with AirPort 2.0.4 in Mac OS X, you are no longer able to configure that base station from Mac OS 9. This is normal behavior.
This article has been archived and is no longer updated by Apple.

Symptom

Once an AirPort Base Station (Dual Ethernet) has been configured using the AirPort 2.0.4 in Mac OS X, you can no longer configure that base station from Mac OS 9. If you attempt to do so, an alert box with this message appears:

> "The selected base station has been configured with the OS X Admin Utility and can no longer be configured with the OS 9 Admin Utility. Please use the most current version of the OS X AirPort Admin Utility to configure this base station."

Figure 1 AirPort Admin Utility alert message

Solution

AirPort 2.0.4 includes features that are only available when configuring the AirPort Base Station (Dual Ethernet) using the AirPort Admin Utility in Mac OS X.

Attempting to administer an updated base station from Mac OS 9 could lead to unpredictable results. For that reason, AirPort Admin Utility access from Mac OS 9 has been disabled for any base station that has been configured from AirPort 2.0.4 in Mac OS X.

You should use the most recent version of the Mac OS X AirPort Admin Utility to set up an updated base station.
Published Date: Feb 18, 2012

Mac OS X: About Networking Update 1.0

The Mac OS X Networking Update 1.0 addresses certain issues and updates system software.
This article has been archived and is no longer updated by Apple.
This software updates certain networking components. Mac OS X 10.1.5 must be installed first.

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If you password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Users from the View menu. Select and Admin user and click Edit User. Click the Password tab. Change the password and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If you experience a power outage or other interruption during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. Prerequisite software must be present before you can install this update, whether you are using Automatic Software Update or standalone installers. Updates must be installed in the correct order. For the correct sequence, see technical document 106713, "**Mac OS X 10.1: Chart of Available Software Updates**".

Installation

There are two ways to update.

I. Automatic Software Update

See technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

II. Standalone Installer

A standalone installer is available from Apple Software Downloads (http://www.apple.com/swupdates/). See technical document 106713, "**Mac OS X 10.1: Chart of Available Software Updates**".

Do not reinstall earlier Mac OS X updates

You should not reinstall certain earlier updates after using this update, including:

- Mac OS X 10.0.1
- Mac OS X 10.0.2
- Mac OS X 10.0.3
- Mac OS X 10.0.4
- Mac OS X 10.1
- Mac OS X 10.1.1
- Mac OS X 10.1.2
- Mac OS X 10.1.3
- Mac OS X 10.1.4
- Mac OS X 10.1.5
- Security Update 10-19-01
- Installer Update 1.0

Updates should be installed in the correct order. If for any reason you need to reinstall an earlier software update, the Mac OS X startup volume should be erased, after first backing up important documents and data. Reinstall Mac OS X, and install necessary updates in the correct order.

Enhancements Delivered with this update

- Addresses a potential issue in which the Internet connection may not be available after waking from sleep.

TA20817_Mac_OS_X_About_Networking_Update_.pdf

- Addresses a potential issue in which a networking connection may not be available when AirPort software is installed.

Published Date: Feb 17, 2012

Xserve: Reset Password Command Does Not Work With RAID Volumes

If the root password is lost and the startup volume is a member of a RAID set, the Reset Password command does not work. You may use the alternative procedure described here.
This article has been archived and is no longer updated by Apple.

Symptom

When the startup disk is a RAID volume, the Reset Password command does not work.

Note: The Reset Password command is found in the Apple menu when started up from the Mac OS X Server Installation CD.

Solution

When the root password has been lost (see Note 1), follow these steps:

1. Start up in single-user mode by holding the Command-S key combination. See Note 2.
2. At the prompt (#), type: `fsck and mount -uw /`
3. Press Return.
4. Type: `nicl -raw /var/db/netinfo/local.nidb`
5. Press Return.
6. Type: `-create /users/root passwd ""`
7. Press Return.
8. Type: `reboot`
9. Press Return.
10. Log in as root.
11. Open Server Admin.
12. Choose Show Users & Groups List from the Users & Groups menu.
13. Click the checkbox to select the "Show System Users & Groups" option.
14. Select the user named System Administrator (which is root).
15. Click Edit.
16. Enter the new password.
17. Click Save.

Notes

1. If the root password is still known and you only need to reset Admin passwords, then log in to the server as root and use the Users pane of System Preferences to change passwords. For a description of the difference between root and Admin passwords, see technical document 106361, "**Mac OS X 10.0, 10.1: Password Does Not Work As Expected After a Change**".

2. You can get additional description of this step from technical document 106388, "**Mac OS X 10.0: How to Start up in Single-User or Verbose Mode**".

Mac OS X Server: About Changing a User‘s Password to a Blank (Null) Value

This document describes when Mac OS X Server users may change their password to a blank value, and when they can change it back to a real value. This document applies only to Mac OS X Server versions 10.0.3 and later.
This article has been archived and is no longer updated by Apple.
Server Admin (versions 10.1 to 10.1.5) and Workgroup Manager (versions 10.2 or later) do not allow you to do either of the following:

- create a user without a password
- edit a user's password to be blank

Users may get a blank password one of these ways:

- AppleShare clients can click Change Password in a connection dialog and set a null value.
- Macintosh Manager clients prior to version 2.2 can click Change Password from the Macintosh Manager Login Window and set a null value.

Note: Macintosh Manager 2.2 and later do not allow users to change their passwords to a blank value. Macintosh Manager 2.2 and later also do not allow users to change their passwords from a blank value to a real one.

In the Macintosh Manager admin application, you may prevent a user from changing her password. This is not a feature, however, of Server Admin or Workgroup Manager.

If you want to turn off the Change Password feature in Macintosh Manager, click the Global tab then the Security tab in the Macintosh Manager admin application. Though Macintosh Manager can prevent users from changing their passwords, a user can still change his password when he connects to a server using the standard AppleShare connection dialog.

The same processes can be used to change a password from a null value to a real value with Mac OS X Server 10.1 through 10.1.5. Server Admin can also be used to create a real value for a user's password.

With Mac OS X Server 10.2 or later, a user cannot change her password from a blank value while at a standard AppleShare connection dialog. With Macintosh Manager 2.2 or later, a user cannot change his password from the Login Window. Only Workgroup Manager can be used to change a password from a blank value with Mac OS X Server 10.2 or later.

Macintosh: Apple Internal Modem Cannot Establish or Maintain a Connection to Some ISPs in the Asia Pacific Region

Some Apple Internal Modems cannot establish or maintain a connection to some Internet service providers (ISPs).

This article has been archived and is no longer updated by Apple.

Symptom

The computer's built-in Apple modem attempts to connect to an ISP but disconnects during negotiation or shortly after the connection is completed.

Solution

Internet access requires compatible Internet service provider. Some Telstra customers in Australia using an Apple Macintosh are experiencing dropout issues. These customers can download a modem updater that addresses their issue at: http://www.asia.apple.com/modemupdater/

Customers who have Mac OS X 10.2 installed do not require this update.

A special number has been set up to assist customers experiencing this issue who have difficulties downloading the updated modem drivers. For further assistance please call 1800 001912.

Notes:

1. This update has only been qualified for systems that utilize the Telstra Network for Internet access.
2. This issue applies only to the ISPs listed above. For regular modem troubleshooting, see technical document 106748, "**Mac OS X: Troubleshooting a Dial-Up/PPP Internet Connection**".

Published Date: Feb 19, 2012

Macintosh Manager 2: How to Recreate the Macintosh Manager User

You may need to recreate the Macintosh Manager User for troubleshooting purposes. This document describes how.
This article has been archived and is no longer updated by Apple.
When troubleshooting Macintosh Manager, its sometimes necessary to recreate the Macintosh Manager User (mmuser). Follow these steps:

1. Using Server Admin, stop the Macintosh Management and AppleShare (AFP) services.
2. Choose Show Users & Groups List from the Users & Groups menu.
3. Click the checkbox to enable the "Show System Users & Groups" option.
4. Select the Macintosh Manager User account.
5. Click Edit.
6. In the user info window that appears, choose Advanced from the pop-up menu.
7. Leaving the user window open, go back to the Users & Group List window. Click ID to sort the list by User ID (UID).
8. Look at ID numbers greater than 100. In your head, choose a number greater than 100 that does not appear in the list.
9. In the user info window, change the User ID to the number you just chose.
10. Click Save.
11. Select the Macintosh Manager user from the Users & Groups List.
12. Click Delete.
13. Restart the Macintosh Management and AFP Servers.

A new user is automatically created when the Macintosh Management Server starts. The permissions of the Macintosh Manager share point are also corrected when the Macintosh Management Server starts.

Note: You should not change settings for the Macintosh Manager User. Follow the steps above to correct issues caused by altering this user's settings.
Published Date: Feb 17, 2012

Mac OS X 10.1.5: Built-In Flat Panel Display Dims

Mac OS X version 10.1.5 introduces automatic display dimming, which occurs after a period of inactivity equal to half the time required for the computer to go to sleep, as set in the Energy Saver pane of System Preferences.
This article has been archived and is no longer updated by Apple.

Symptom

A built-in flat panel display dims. This may occur while watching a movie or slide show.

Solution

As an added feature of Energy Saver, a built-in flat panel displays dim after a period of inactivity equal to half the time required for the computer to go to sleep, as set in the Energy Saver pane of System Preferences. Because watching a movie or slide show does not count as activity, the display may dim while you are watching a QuickTime movie or slide show.

Dimming helps prevent image persistence that can be caused by an unchanging image, such as a login screen. There is no independent setting for display dimming in the Energy Saver preference pane. Pressing any key brings the screen back to full brightness, or wakes the computer.

If you want to prevent dimming while watching a movie or slide show, follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Energy Saver from the View menu.
3. Set the slider for "Put system to sleep whenever it is inactive for" to Never.
4. Be sure the checkbox for "Separate timing for display sleep" is not selected."

Note: After viewing a QuickTime movie or slide show, you may wish to set the Energy Saver system preference back to your sleep preference, especially if you need to conserve battery life.

For more information, see technical documents:

106880: "**Mac OS X: Screen Saver Slide Show Goes Blank (or Black)**"

Mac OS X 10.1: Cannot Update Software After Using Security Update 7-12-2002

Other software updates may not be available after installing Security Update 7-12-02.
This article has been archived and is no longer updated by Apple.

Symptom

- No software updates appear when you use the Software Update feature of System Preferences.
- The standalone installer for Security Update 10-29-2001 cannot be installed on Mac OS X 10.1, because the volume cannot be selected in the installer.

Solutions

Download and install Security Update 7-18-02 for v 10.1. It is available from software download document 120136, "**Security Update 7-18-02 for v 10.1: Information and Download**".

Important: This is not the same as "Security Update 7-18-02", which is available from software download document 75304, and which is appropriate for Mac OS X versions 10.1.1 through 10.1.5. This update combines and replaces:

- Security Update 10-19-2001
- Installer Update for Mac OS X 10.1
- Security Update 7-12-2002

Published Date: Feb 17, 2012

AppleWorks 6: Do Not Drag the AppleWorks 6 Application From Its Folder

You should leave the AppleWorks 6 application inside the AppleWorks 6 folder. When the application is moved, it may not be able to find files that provide its extended features.

This article has been archived and is no longer updated by Apple.

Symptom

When you open AppleWorks 6, one or both of these symptoms occur:

- The Starting Points window lacks the Assistants, Templates and Web tabs.
- An alert box with the message, "The main spell dictionary is not installed" appears when you check spelling.

Solution

1. Quit AppleWorks 6.
2. Drag the AppleWorks 6 application back into the AppleWorks 6 folder.
3. Reopen AppleWorks 6

If this does not resolve the issue, reinstall AppleWorks 6 from the original CD or restore set. Make sure to also install the latest available AppleWorks 6 update after reinstallation. Software updates are available from Apple Software Downloads (http://www.apple.com/swupdates/).

Published Date: Feb 17, 2012

AppleWorks 6: Importing Other Types of Documents Doesn‘t Work

When importing files produced by other applications, use the Open command within AppleWorks for bests results. You may then specify how you want the file imported.

This article has been archived and is no longer updated by Apple.

Symptom

1. In the Finder, double-clicking a document you want to open with AppleWorks results in one of these symptoms:

- An alert box with the message, "The document could not be opened because the application cannot be found." appears.
- An alert box with the message, "There is no application available to open the document." appears.
- The document opens in an application other than AppleWorks 6.

2. Dragging a document onto the AppleWorks 6 application icon results in one of these symptoms:

- The document does not open.
- The document opens in the wrong AppleWorks module (word processing text opens as a spreadsheet for example).
- The document opens unreadable text.

Solution

Follow these steps to import a non-AppleWorks document:

1. Open AppleWorks 6.
2. Choose Open from the File menu.
3. In the window that appears, choose the type of document you are opening from the Document Type pop-up menu. For example, if you want to open a text document in the AppleWorks 6 Word Processing module, choose "Word Processing" from the pop-up menu.
4. Choose the existing file format from the File Format pop-up menu. For example, if you want to open a Microsoft Word 2001 document in AppleWorks 6, choose "Word Mac 98, 2001 document" from the pop-up menu.
5. Select the document you want to open in AppleWorks 6 from the list of files.
6. Click Open.

AppleWorks will try to open the document as you specified in Steps 3 and 4. For best results, be sure to specify both.

Published Date: Feb 17, 2012

AppleWorks 6: How to Use With Multiple Users or Macintosh Manager in Mac OS 9

To use AppleWorks 6 in a Mac OS 9 Macintosh Manager or Multiple Users environment, you need to add the Classic version of the application to the approved list.
This article has been archived and is no longer updated by Apple.

Symptom

One or more of the following occurs:

- AppleWorks 6 is not available when you try to select it as an approved application during Macintosh Manager or Multiple Users setup.
- When you open AppleWorks 6 from a Mac OS 9 computer, an alert box with this message appears:
  "AppleWorks requires a compatible version of Mac OS X."
- AppleWorks 6 will not launch from the Panels environment.

Solution

1. Log in to the computer containing the AppleWorks application as an administrator.
2. Locate the AppleWorks 6 application in the Finder.
3. Press and hold the Control key, then click the AppleWorks 6 application icon. A contextual menu appears.
4. Choose Show Package Contents from the contextual menu.
5. Open the Contents folder.
6. Open the MacOSClassic folder.
7. Pressing and hold the Option key, then drag the AppleWorks 6 application from the MacOSClassic folder to the AppleWorks 6 folder. This should make a copy at the top level of the AppleWorks 6 folder.
8. Rename the copy you created to "AppleWorks 6 classic".

When adding the application to users' approved application lists, specify "AppleWorks 6 classic" for those using Mac OS 9 or earlier.

Note: In order for a managed user to be able to spell check in AppleWorks, you have to create a new user dictionary in that user's Documents folder. For more information on creating a user dictionary, see technical document 50387, "**AppleWorks 6: How to Work with Dictionaries"**.

Xserve: Server Assistant does not accept Xserve serial number for remote installation

This article has been archived and is no longer updated by Apple.

If Server Assistant will not accept your Xserve serial number for remote installation, follow the steps outlined in this document.

Symptom

When remotely installing or setting up Mac OS X Server, Server Assistant does not accept the Xserve computer's serial number as the password.

Note: Server Assistant normally requires the first eight characters of the Xserve serial number. If the Xserve computer's logic board has been replaced and the steps in this document do not help, contact the Apple Authorized Service Provider who replaced the logic board for further assistance.

Solution

1. Be sure you're using the server's built-in Ethernet port.

2. Use Network Utility to ping the Xserve to verify your connection.

3. Be sure the remote administration computer is on the same subnet as the server. The IP address the server has obtained appears in the Server Assistant window.

4. At the remote administration computer, be sure to log in as an Admin user. You may also try the root user.

5. Be sure the Admin has read-write access to the folder /System/Library/ServerSetup and the contents of this folder on the remote administration computer.

Mac OS X 10.1: About the Security Update 7-18-02

The Mac OS X Security Update 7-18-02 further improves the security of the Software Update process.
This article has been archived and is no longer updated by Apple.
This software further improves the security of the Software Update process. Mac OS X 10.1 or later is required.

Note: this update should not be confused with Security Update July 2002. For related information, see technical document 106925, "**Mac OS X: About Security Update July 2002**".

Important: Security Update 7-18-02 replaces the prior Security Update 10-19-01 and Installer Update 1.0. To avoid reintroducing issues resolved by Security Update 7-18-02, do not reinstall either of the older updates."

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Users from the View menu. Select an Admin user and click Edit User. Click the Password tab. Change the password and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

Enhancements delivered with this update

Security Update 7-18-02 includes a more secure Software Update service, as well as an updated Software Update command line tool, which enables your system to verify that updates have originated from Apple.

Installation

Note: A different version of the update is required for Mac OS X version 10.1 than for versions 10.1.1 through 10.1.5. It is important that you choose Section I or II accordingly.

I. Steps for Mac OS X version 10.1 only

Use the standalone installer available from this software download document 120136, "**Security Update 7-18-02 for v 10.1: Information and Download**".
Optionally, you may verify the authenticity of the of the download package by checking its SHA-1 digest. This is described on the download page.

II. Steps for Mac OS X versions 10.1.1 to 10.1.5

You may use either a standalone installer or Automatic Software Update.

A. Automatic Software Update

To learn about this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

B. Secure Standalone Installer

You can get a secure standalone installer from software download document 75304, "**Security Update 7-18-02: Information and Download**".

Optionally, you may verify the authenticity of the of the download package by checking its SHA-1 digest. This is described in technical document 75304.

Xserve (Japanese): Settings Revert to English During Remote Configuration; File Service Issues Result

Some settings will incorrectly be set to English when using the Server Assistant application to remotely configure an Xserve server for a Japanese environment. File services do not work as expected.
This article has been archived and is no longer updated by Apple.

Symptom

- Some settings that should be in Japanese appear in English.
- The Macintosh Manager application cannot be used.
- Apple (AFP) and Windows (SMB) file services may not work.

Solution

This issue is resolved in Mac OS X Server 10.2 or later. For upgrade information, see:

Apple Japan - Mac OS X Server Up-To-Date
http://www.apple.co.jp/macosx/server/uptodate/index.html

Users of Mac OS X Server 10.1.5 may follow these steps:

1. Open Server Admin.
2. Click the File & Print tab.
3. Choose Configure Apple File Service from the Apple module.
4. Click the Access tab.
5. Choose Japanese from the "Encoding for older clients" pop-up menu.
6. Click Save, and close the window.
7. Choose Configure Windows Services from the Windows module.
8. Click the General tab.
9. Choose Japanese from the "Code Page" pop-up menu.
10. Click Save.

You can perform the steps above remotely from a computer that has the Mac OS X Server administration tools installed. If you log in locally at the server you will initially see English menus. To correct this, follow these additional steps:

1. Choose System Preferences from the Apple menu.
2. Choose International from the View menu.
3. Drag Japanese to the top of the Languages list.
4. Choose Log Out from the Apple menu.
5. Optional: To correct the language of the Login window, you should repeat Steps 1 to 4 while logged in as the root user. For more information see technical document 106290, "**Mac OS X: About the root User and How to Enable It**".

Published Date: Feb 19, 2012

Microsoft Internet: "Error of Type -2" When Opening Explorer, Outlook Express, or Entourage

If the Internet Preferences file becomes unusable, Microsoft Internet applications may display an alert box with a message similar to "an error of type -2 has occurred."
This article has been archived and is no longer updated by Apple.

Symptom

When you open a Microsoft Internet application, an alert box with a message similar the following appears:

> "An error of type -2 has occurred."

Solution

Various Internet applications, including those made by Microsoft, use information stored in the Mac OS 9 Internet Preferences file. These are settings that you enter in the Internet control panel. The "type -2 error" message may appear when this preference file becomes unusable.

Warning: Removing the Internet Preferences file removes information you have entered in the Internet control panel. Before starting the steps listed below, you should write down or copy this information to another location. If it is not possible to retrieve this information, contact your Internet service provider (ISP).

Follow these steps:

1. Locate your Internet Preferences file. It is found at:

   Macintosh HD: System Folder: Preferences: Internet Preferences

2. Drag the Internet Preferences file to the Trash.
3. Restart the computer.
4. Open the Internet control panel.
5. Enter your Internet settings.
6. Close the control panel.
7. Optional: Save a copy of the newly created file to a location outside the Preferences folder as a backup. If the issue recurs, you can replace the unusable copy with a copy of the backup file.

For more information, see the Microsoft Support document, "ENT2001: Error Type 2 Appears When You Start Entourage, Internet Explorer, or Outlook Express."

This document provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

Mac OS X 10.1: "Error Code -50" Alert Appears When Copying Files From a Remote Disk

When trying to copy files created by other users from a remote disk to the local Mac OS X startup disk, the root user may see an alert box with the message "Error code -50" .
This article has been archived and is no longer updated by Apple.

Symptom

When you are logged in as the root user and you try to copy files from a remote disk to the local Mac OS X startup disk, an alert box with this message appears:

> "Sorry, the operation could not be completed because an unexpected error occurred (Error code -50)."

Solution

You may use the copy command (cp) or CpMac command in the Terminal to work around this issue, as described below.

Warning

- When copying an item with the cp command, any item in the destination folder of the same name is overwritten immediately. You do not receive a warning as in the Finder. Be sure to rename or remove any item of the same name that you do not wish to lose.
- Any file that has a resource fork must be copied with CpMac, not with cp. Information for using CpMac may be found in technical document 61646, "**Mac OS X: About Improving SMB File Transfer Speed with cp or CpMac**".
- As a general precaution, you should only log in as the root user when there is not an alternative. For information and precautionary statements about using the root user, see technical document 106290, "**Mac OS X: About the root User and How to Enable It**".

To use the cp command , follow these steps:

1. Open Terminal (/Applications/Utilities/).
2. Type: `cp -R`
Important: You must type a space after the "R", so that the result is "`cp -R `". The command does not work without the space.
3. Drag the folder or file you wish to copy from the Finder window into the Terminal window. This will automatically type the item's pathname for you, and the required space should automatically be typed after it.
4. Drag the desired destination folder from the Finder window into the Terminal window. The pathname is automatically typed.
5. Press Return.
6. Quit Terminal.

Note: This article contains information about Apple Developer Tools software (CpMac). AppleCare does not provide usage support for Apple Developer Tools software. Paid support for Apple Developer Tools software is available at http://developer.apple.com.

Mac OS X 10.2 (British): Paper Size Reverts to US Letter

After a user of the British keyboard layout chooses the A4 paper size, it may revert to US Letter on the next document.
This article has been archived and is no longer updated by Apple.

Symptom

- After selecting the British keyboard layout, US Letter remains the default paper size.
- After you select the A4 paper size, it reverts to US Letter for the next new document.

  Note: Since US Letter is the default, this behavior is actually correct. It is often misperceived that changing the paper size for one document changes the default paper size either for an application or for the system.

Solution

The default paper size is initially set to match the preferred language in the International preference pane, not to match the keyboard layout. US Letter is selected for English, and A4 is selected for other languages. After you select your language and keyboard layout, you may change the default paper size. Follow these steps:

1. Open Print Center (/Applications/Utilities/).
2. Choose Print Center > Preferences.
3. Choose the paper size from the Default Paper Size pop-up menu.

The default paper size will be used with any new documents you create. Existing documents will retain their previous paper size until you change and save them on an individual basis.

Note: A localized application may specify its own default size, but the system's default is used when an application is not localized for the selected language or region. This explains why applications may default to different paper sizes.
Published Date: Feb 17, 2012

Mac OS X 10.2: How to Change Default Paper Size

You may use Print Center to change the default paper size, which initially follows the selected language.
This article has been archived and is no longer updated by Apple.
The system's default paper size is initially set to match the preferred language in the International preference pane. US Letter is selected for English, and A4 is selected for other languages. You may change this in Print Center. Follow these steps:

1. Open Print Center (/Applications/Utilities/).
2. Choose Print Center > Preferences.
3. Choose a paper size from the Default Paper Size pop-up menu.

The default paper size will be used with any new documents you create. Existing documents will retain their previous paper size until you change and save them on an individual basis.

Note: A localized application may specify its own default size, but the system's default is used when an application is not localized for the selected language or region. This explains why applications may default to different paper sizes.

For additional information, users of the British keyboard layout should see technical document 106948, "**Mac OS X 10.2 (British): Paper Size Reverts to US Letter**".

Mac OS X Server 10.1: DHCP Leases Do Not Appear to Expire

When looking at DHCP client information in Server Admin, you may see client IP addresses with a Time Left value of "0 minutes". IP Addresses with this notation represent client leases that have expired, but that have not necessarily been reassigned.
This article has been archived and is no longer updated by Apple.

Symptom

DHCP clients have a Time Left value of "0 minutes" listed in Server Admin. This appears in the DHCP Clients window (Figure 1), which is accessed by choosing View DHCP Clients from the DHCP/NetBoot module of Server Admin.

Figure 1 The DHCP Clients window

Solution

Client lease expiration occurs at the time specified in the Configure DHCP window of Server Admin. When client leases expire, the DHCP Clients window of Server Admin shows a Time Left value of "0 minutes". These are leases that have expired and are available for reassignment, if necessary.

The DHCP server attempts to associate client hardware addresses with the same IP addresses whenever possible, so an expired lease is retained for future reassignment to the same hardware address that originally requested it. The DHCP server will recycle a leased IP address when these conditions are met:

- A number of client hardware addresses equal to or greater than the maximum number of leases has previously requested a lease.
- The number of computers with unexpired leases is less than the maximum number of leases.
- The lease of the IP address to be recycled is expired.
- The expired lease to be reassigned is associated with the least recently requesting hardware address.

The available IP address range (and thus maximum number of leases) is set in Server Admin. To access these settings, follow these steps:

1. Open Server Admin.
2. Click the Network tab.
3. Choose Configure DHCP from the DHCP/NetBoot module.
4. Click the Subnets tab, if necessary.
5. Select the subnet.
6. Click Edit.

These settings appear in the General pane of the subnet's individual configuration window.

Example

If you create a pool of 100 DHCP client addresses but only start up 25 computers, then the same 25 leases should always be given to those computers. Next, let these leases expire and start up 25 different computers. These clients now receive 25 new leases while the original 25 show as expired. If you start up the original 25 computers, they should get the same IP addresses they had before.

If you keep starting up new computers until 100 leases are used, each computer receives its leased IP address. At this point, no additional computers should be able to receive a new lease. If you shut down all computers and allow the leases to expire, a newly added system (computer 101) gets a new lease, but consumes a previously used DHCP IP address. Server Admin would indicated that there are now 99 leases with a Time Left value of 0 minutes.

Mac OS X 10.0, 10.1: Mail Sends Same Message Repeatedly

If sent mail is saved in the Outbox, Mail sends the same message repeatedly.
This article has been archived and is no longer updated by Apple.

Symptom

- A message remains in the Outbox after it is sent.
- The message is sent again each time other messages are sent.

Solution

This occurs if sent mail is saved in the Outbox folder. Instead, you should keep sent mail in the Sent Messages mailbox. Remove messages from the Outbox if necessary. If your sent mail is automatically being saved in the Outbox, follow these steps:

1. Select Mail Preferences from the Mail menu.
2. Click the Composing icon.
3. Choose Sent Messages from the "Save sent mail in" pop-up menu.
4. Quit and open Mail.

If the issue persists, restart the computer.

Mac OS X 10.1: Disk and File Names Appear Garbled

If Mac OS X was installed from a language other than the one you have selected, disk and file names may appear garbled when you use removable media or connect to a remote disk.
This article has been archived and is no longer updated by Apple.

Symptom

File and disk names may appear garbled when you:

- insert a CD, or other removable media.
- connect to a remote disk served by a computer with Mac OS 9, via file sharing, for example.

Solution

This issue occurs when text encoding defaults to the language used to install Mac OS X, rather than your preferred language.

When using a disk other than the Mac OS X startup volume, text encoding does not always automatically switch to that which you prefer. Follow these steps to choose the correct text encoding for the affected disk:

1. Click the Finder icon in the Dock.
2. Choose Computer from the Go menu.
3. Select the affected volume.
4. Choose Show Info from the File menu.
5. Choose your preferred language from the Encoding pop-up menu.

The correct encoding causes file names to be displayed correctly.

Note: The Encoding menu appears in the Info window only when applicable to the selected volume. It does not appear, for example, if you have selected your Mac OS X startup disk.

Mac OS X Server: A File Copied From a Server May Not Open Under Certain Circumstances

In some circumstances, a file copied from Mac OS X Server 10.1 or later to a client computer cannot be opened. This document provides a workaround for opening the file.
This article has been archived and is no longer updated by Apple.

Symptom

A file copied from Mac OS X Server to a client computer cannot be opened by a particular user.

Note: This symptom occurs under specific, limited circumstances after a file has been modified by different users in a particular sequence. It results from the permissions model in Mac OS X that protects the privacy of users' files. If you know that the user who copied the file should be able to open and use it, then the workaround described below will allow that user to open the file.

Solution

Follow these steps to give the affected user permissions for the file. Steps 2 through 4 are optional.

1. Log in as an Admin user.
2. Select the affected file in the Finder.
3. Choose Show Info (Mac OS X 10.1), or Get Info (Mac OS X 10.2) from the File menu.
4. In the Info window, you may verify that the affected user does not have ownership or adequate permissions for the file.
5. Open Terminal (/Applications/Utilities/).
6. Type: `sudo chown <username>`
Important: Replace "<username>" with the actual short name of the affected user. Additionally, you must type a space after the short name. So for a user with a short name of "bernard", the correct text entry would be "`sudo chown bernard `".
7. Drag the affected file from the Finder into the Terminal window. This automatically types the pathname of the file for you.
8. Press Return.
9. When prompted, enter your Admin user password, then press Return.
10. Quit Terminal.

The affected user should now be able to open the file. You may verify ownership of the file in the Info window.

Mac OS X 10.2: Disks (Volumes) Do Not Appear in the Installer

In some situations, hard disk volumes do not appear as a choice in the Mac OS X 10.2 Installer during installation.
This article has been archived and is no longer updated by Apple.

Symptom

No volumes are available in the Installer application.

Solution

These steps may help:

1. Choose Disk Utility from the Installer Menu.
2. Click the First Aid tab.
3. Use the Repair feature on the affected disk (or disks), if it appears.
4. If the disk still does not appear, restart the computer from the Install CD.
5. If the disk still does not appear, shut down the computer.
6. Disconnect any third-party hardware upgrades or peripheral devices, including additional hard drives, USB devices, or FireWire devices.
7. If jumper settings on the original hard drive have been changed, return them to their original position.

Note: If volumes only fail to appear when a known-working secondary hard drive is installed, verify that the jumper settings on the drive are appropriate. For example, with Power Mac G4 (Mirrored Drive Door) computers, additional ATA hard disks must be set for cable select mode, not for master or slave mode. Consult the documentation that came with your computer.

8. Start up from the Install CD.
9. If the disk still does not appear, use Disk Utility again. If the disk appears in Disk Utility but not in the Installer application, back up any important data from the disk and erase it in Disk Utility. The drive should then appear in Installer.

iPod‘s remote control isn‘t working

Learn what to do if iPod plays music, but the remote's buttons do not work.

This article has been archived and is no longer updated by Apple.

1. Make sure the iPod remote Hold switch is turned off. Slide the Hold switch up so the green mark is visible.
2. When you insert the remote connector into the iPod and think it is secure, give it an extra push. You should feel it click into place. The click is noticeable. If the remote does not click into place, audio will play through the headphones, but the controls on the remote will not respond.

In the first image below, the connector is not inserted far enough into iPod. You can see the metal ring. In this case, you will hear sound in the headphones, but the remote will not work.

In the second image, the remote connector is correctly inserted.

Mac OS X 10.2: How to Change Modem Country Setting

You may change the modem country setting using System Preferences, when traveling for example.

Note: This document applies to Mac OS X 10.2 through 10.2.8.

This article has been archived and is no longer updated by Apple.
Mac OS X 10.2 allows you to change the modem country setting via the System Preferences application. You may need to do this when traveling abroad.

Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Date & Time from the View menu.
3. Click the Time Zone tab.
4. Click your part of the world, then choose a city near you from the "Closest City" pop-up menu.
5. Choose Network from the View menu.
6. Choose Internal Modem from the Show pop-up menu.
7. Click the Modem tab, and verify that the Country Setting is correct.

Mac OS X 10.2: Some Classic Components Are Later Than Mac OS 9.2.2

Mac OS X 10.2 includes some Classic components with version numbers later than Mac OS 9.2.2.
This article has been archived and is no longer updated by Apple.
Mac OS X 10.2 includes the versions of Classic components listed below. These are later versions than the same-named components included with Mac OS 9.2.2. These components are installed in your Mac OS 9 System Folder when the Classic environment is opened for the first time, unless they are already present.

Control Panels

- Keyboard (8.6.2)
- Startup Disk (9.2.4)

Extensions

- AppleScript (1.8.3)
- CarbonLib (1.6)
- Classic RAVE (1.8)
- InputSprocket Classic (1.8)
- Network Setup Extension (1.3.3)
- Open Transport (2.8)
- Open Transport ASLM Modules (2.8)
- QuickDraw 3D RAVE (1.8)

Other

- Classic (9.3.0)
- Classic Support (2.1)
- Classic Support UI (2.1)
- Script Editor (1.8.3)
- Standard Additions (1.8.3)

Note: If you start up from your Mac OS 9.2.2 System Folder after Mac OS X 10.2 has been installed, these components will continue to work.
Published Date: Oct 10, 2016

Mac OS X Server 10.2: NetBoot and Network Installation Image Behavior

Mac OS X Server 10.2 allows you to choose which network disk image is the default startup volume for your NetBoot clients. If only one image is available, it becomes the default startup volume for NetBoot clients or Network Installation.
This article has been archived and is no longer updated by Apple.
Mac OS X Server 10.2 allows multiple network disk images to be used with NetBoot client computers. The network images can be used to start up clients in both Mac OS X and Mac OS 9, or to install software as Network Installation volumes. If multiple images exist on a Mac OS X Server 10.2 computer, each can be enabled or disabled, or be set up as a default image for NetBoot clients. You can find these settings by clicking the Image tab in the DHCP/NetBoot configuration window.

If a NetBoot server has only one image, this image becomes the default image for NetBoot clients regardless of the default checkbox selection made. This behavior has implications in a scenario in which the only image on the server is a Network Installation image. If you use a Network Installation image to start up and install software on your client systems, you should also disable the image after the installation has taken place in order to avoid unauthorized installation of software on your client computers.

If you want to reset the default image selection for all NetBoot clients, you should remove the bsdpd_clients listing file from /var/db, followed by restarting server. Then, hold "N" key while starting up each client computer. The user will be forced to the proper default image. Clients will now be bound to the new image by default.

Note: Changing the NetBoot/Network Installation image settings may require restarting the server computer.
Published Date: Oct 10, 2016

Mac OS X 10.2: Classic Requires That You Already Have Mac OS 9

The Classic environment of Mac OS X 10.2 allows you to use Classic applications provided you already have a copy of Mac OS 9.
This article has been archived and is no longer updated by Apple.
The Classic environment of Mac OS X allows you to use Classic applications. Mac OS 9 must be installed on your computer for Classic applications to work. (See Note 1.) Mac OS X 10.2 does not include Mac OS 9. You may install Mac OS 9 from:

- a Mac OS 9 CD that came with your computer (if one did)
- a Mac OS 9 retail CD
- a Mac OS 9 CD included with an earlier retail version of Mac OS X

Customers in the United States who have purchased Mac OS X 10.2 but do not have Mac OS 9 may take part in the Mac OS 9.2 Fulfillment Program (http://www.apple.com/macosx/upgrade/). This applies, for example, if you have a Mac OS X-compatible computer that had been using Mac OS 8.6. In the event that you have lost the Mac OS 9 CD that came with your computer, be aware that the fulfillment program is not suitable for some computers that originally included Mac OS 9.2.1 or later. Such computers may require a later Installation disc.

Customers in other regions should check localized Apple Web sites or contact the Apple Store for applicable purchase options. From the Apple.com front page, choose your region from the "Visit other Apple sites around the world" menu. Then click the Mac OS X tab, then the Upgrade link (in the navigation bar directly below the tabs).

Notes

1. To learn more about Classic applications, see technical document 107033, "**Mac OS X: What is a Classic Application?**"

2. The Mac OS X 10.2 Classic environment requires Mac OS 9.1 or later (Mac OS 9.2.2 recommended). Any installation of Mac OS 9.0 to 9.2.1 may be updated to version 9.2.2 by using the Software Update control panel. See technical document 75288, "**Mac OS 9: Available Updates**".

3. For more information, please see Mac OS X Upgrade Technical Specifications (http://www.apple.com/macosx/techspecs/).

Published Date: Oct 10, 2016

Mac OS X: Classic System Folder Does Not Work With Earlier Versions of Mac OS X After 10.2 Update

After a Mac OS 9 System Folder has been updated with Classic system resources from Mac OS X 10.2, it should not be used with Mac OS X 10.0 through 10.1.5.
This article has been archived and is no longer updated by Apple.

Symptom

Classic is not usable after it is started, and an alert box you cannot dismiss may appear with this message:

> "The application 'Finder' has unexpectedly quit."

Note: The System Folder is not affected when used independently of Mac OS X.

Solution

Do not use a Mac OS 9 System Folder with Mac OS X 10.1.5 or earlier after it has been updated by Mac OS X 10.2.

You may use the following temporary workaround to use this System Folder within a Mac OS X 10.0 through 10.1.5 Classic environment:

1. Before starting Classic, open the System Folder. **Important:** Do not confuse this with the folder named "System".
2. Locate and drag these files, which are located in the top-level of the System Folder, to another folder, or to the desktop:
   - Classic
   - Classic Support
   - Classic Support UI
3. Choose System Preferences from the Apple menu
4. Choose Classic from the View menu.
5. Click Start.
6. Click OK when prompted to install Classic system resources.

Notes

1. If you use this System Folder with Mac OS X 10.2 in the future, Mac OS X 10.2 will ask to update these Classic system resources again the first time that Classic is started.

2. You can also avoid this issue by installing a licensed copy of the Mac OS 9 System Folder for each version of Mac OS X that is installed. Each System Folder should be used by only one version of Mac OS X.

Published Date: Oct 10, 2016

Mac OS X: Restart Classic Environment After Force Quitting Classic Outlook Express or Internet Explorer

If Microsoft Outlook Express or Internet Explorer are force quit in the Classic environment, you should restart Classic.
This article has been archived and is no longer updated by Apple.

Symptom

Classic application programs stop responding or "freeze" after you force quit Outlook Express or Internet Explorer in the Classic environment.

Note: This issue does not affect the Mac OS X-native version of Internet Explorer installed in your Mac OS X Applications folder.

Solution

1. Save any work that you have open.
2. Restart the Classic environment by doing one of the following:
   - Click Restart in the Classic preference pane. This only restarts the Classic environment. It does not restart the computer.
   - Log out, then log back in.
   - Restart the computer.

Mac OS X 10.2 (Retail): Unable to Use EarthLink Software

If you cannot use EarthLink software to set up a new account, or to locate a different dial-up access number, you should download a later software version from EarthLink.
This article has been archived and is no longer updated by Apple.

Symptom

- You are unable to successfully set up a new EarthLink account after entering personal and credit card information.
- You are unable to use EarthLink software to locate a different dial-up access number.

Solution

If you are setting up a new EarthLink account, use Setup Assistant instead. Setup Assistant is located in this path: /System/Library/Core Services/Setup Assistant

To use EarthLink software for setting up a new account, or locating a different access number, download and use EarthLink version 2.6.3 or later from:

EarthLink Software (Macintosh)
http://www.earthlink.com/home/software/mac/

If you cannot connect to the Internet, you may order EarthLink software by calling 1-800-719-4660 (option 2).

Mac OS X 10.2: Some Classic Microsoft Applications Appear to Lose User Settings and Information

After upgrading to Mac OS X 10.2, Classic Microsoft applications that store information in the Microsoft User Data folder may appear to have lost user preferences and other information, including mail messages. This includes Microsoft Office 2001 and Outlook Express 5.
This article has been archived and is no longer updated by Apple.

Symptom

A Classic Microsoft application opens but does not retain user information or preferences. An alert box may appear with a message that the Microsoft User Data folder is not in the expected location.

Solution

Classic Microsoft applications that rely on the Microsoft User Data folder expect it to be in the Documents folder. Unlike prior versions of Mac OS X, the version 10.2 Classic Environment uses the Documents folder that is in a user's Home directory, rather than the Documents folder at root level of the Classic System Folder's volume. There is a general solution and an Outlook Express-specific solution.

General solution

Drag the Microsoft User Data folder to the Documents folder in your Home directory by following these steps:

1. Quit any affected Microsoft application that is open.
2. Locate the Microsoft User Data folder that is in the Documents folder. It is at the top (root) level of the hard disk volume that contains your Mac OS 9 System Folder. If your System Folder was on a disk named Macintosh HD, that location would be noted as:

   Macintosh HD : Documents : Microsoft User Data

3. Drag the Microsoft User Data folder to the desktop.
4. Click the Finder icon in the Dock.
5. Choose View > Home.
6. Drag the Microsoft User Data folder from the Desktop into the Documents folder that is in your Home directory.

Once this is complete, you should be able to use the affected Microsoft applications as expected.

Important: In the event that you subsequently start up the computer from Mac OS 9 and open the affected Microsoft applications, the software will expect the Microsoft User Data folder to be in its original location. You can create an alias of the Microsoft User Data and place it at the root level of the Mac OS 9 disk, if you plan on starting up in Mac OS 9 often.

Outlook Express 5 Only

Note: This solution applies only to Classic Outlook Express 5.0 or later.

Outlook Express may prompt you to move the Identities folder, which is located in the Microsoft User Data folder, to the Outlook Express folder. You may use this alternate solution:

1. Quit Outlook Express if it is open.
2. Locate the Identities folder, which is located in the Microsoft User Data folder. If your System Folder was on a disk named Macintosh HD, that location would be noted as:

   Macintosh HD : Documents : Microsoft User Data : Identities

3. Drag the Identities folder into your Outlook Express 5 application folder.

Your user settings and mail messages should now be available whether the computer is started up from Mac OS 9 or Mac OS X 10.2.

iChat: AOL Instant Messenger Compatibility With .Mac Users

AOL Instant Messenger (AIM) users should use a current version of AIM software for compatibility with iChat users who are using a .Mac account name.

This article has been archived and is no longer updated by Apple.

Symptom

Online users of iChat and AIM cannot communicate.

Solution

Affected AIM users should update to a later version of AIM software.

- For Mac OS, use AIM v 4.5.651 or later.
- For Microsoft Windows, use AIM v 4.8.2790 or later.

Visit the AIM Web site to download new software (http://www.aim.com/).

Note: Third-party AIM clients may not work as expected. For best results, both parties should use either AIM or iChat.

Mac OS X: How to remove and recreate an inaccessible keychain

This article has been archived and is no longer updated by Apple.

You may delete and recreate a keychain file if the keychain is inaccessible (locked with a lost or unavailable password).

Notes

1. After removing the old keychain and creating a new one, you will need to re-enter stored passwords again.

2. If you use more than one keychain and wish to set the new keychain as default, select it in the list and choose Keychains > Make Default (Mac OS X 10.1) or File > Make Default (Mac OS X 10.2) in Keychain Access.

Mac OS X 10.2, 10.3, 10.4 or later instructions

1. Log in as the affected user.
2. Open Keychain Access (/Applications/Utilities).
3. If the Keychain Files list is not available, click Keychains (Mac OS X 10.3.9 or earlier, upper right corner) or Show Keychains (Mac OS X 10.4 or later, bottom left corner).

4. Select the inaccessible keychain that you wish to remove from the Keychain Files list.
5. Choose Delete "<keychain_name>" from the File menu.
6. When prompted, click Delete References & Files. This deletes the actual keychain file, instead of just the passwords stored in the keychain file.
7. Choose File > New > New Keychain. When prompted, enter a unique name and password for the new keychain.
8. Select the new keychain that appears in the Keychain Files list.
9. Choose File > Make "<new_keychain_name>" Default. The name of the new keychain is now bold in the Keychains Files list.

You may now use the new keychain to store passwords.

Mac OS X 10.1 Instructions

1. Log in as the affected user.
2. Open Keychain Access (/Applications/Utilities).
3. Choose Edit > Keychain List.
4. Select the inaccessible keychain file in the Keychain List window.
5. Click Remove.
6. When prompted, click Delete. The keychain file is removed from the list.
7. Click New.
8. Type a name for the keychain. You may wish to use the same name as the keychain file you just deleted.
9. Type and verify the keychain's new password.
10. Click OK.

You may now use the new keychain to store passwords.

Mac OS X 10.2: Startup Graphics Do Not Appear Correctly When Multiple Versions Are Installed

The graphics normally seen during the first portion of Mac OS X 10.2 startup are not drawn and animated correctly when multiple versions of Mac OS X are installed.
This article has been archived and is no longer updated by Apple.

Symptom

When you start up Mac OS X 10.2, a gray screen appears that includes the Apple logo and an animated graphic. The animated graphic on this screen is not drawn and animated correctly. This condition may sometimes be referred to as a "corrupted graphic."

Solution

If multiple version of Mac OS X are installed on an affected computer, the startup graphic is not drawn and animated correctly. This would happen, for example, if you installed Mac OS X versions 10.1.5 and 10.2 on two separate partitions on the same computer.

On the affected computers listed above, you should not install different versions of Mac OS X on different partitions or disks.

Notes

1. On any computer, you should only install Mac OS X in keeping with the terms of the included Software License Agreement.

2. Installing multiple versions of Mac OS X on the same computer may result in undesired and conflicting user privileges settings.

Published Date: Oct 10, 2016

Mac OS X 10.2: Can See Shared Printer But Cannot Print to It

When using Printer Sharing, you may be able to see a shared printer, but not print to it.
This article has been archived and is no longer updated by Apple.

Symptom

- The shared printer appears as a choice at another computer, but that computer cannot print to it.
- Alert boxes appear when you try to print.

Note: This issue does not occur on all types of networks. Certain DNS configurations may prevent the issue from occurring.

Solution

Update to Mac OS X 10.2.1. For more information, see technical document 107036, "**Mac OS X: About the Mac OS X 10.2.1 Update**".

If you cannot immediately update and need a temporary workaround, then follow these steps:

1. Choose ⇒ Location ⇒ Network Preferences.
2. In the Search Domains field, type: `local`.

Figure 1 The Network preference pane

3. Click Apply Now.

Published Date: Oct 10, 2016

Mac OS X 10.2: Internet Sharing Lists Port Name Two or More Times

You may see a message that your connection is being shared over "Built-in Ethernet and Built-in Ethernet", "AirPort and AirPort", or a similar combination.

This article has been archived and is no longer updated by Apple.

Symptom

After you turn on Internet Sharing, you may see a message in the preference pane that repeats the same port (network interface) name two or more times. Possible messages include these examples:

> "This connection will be shared with computers connected to Built-in Ethernet, AirPort and Built-in Ethernet."
>
> "This connection will be shared with computers connected to AirPort and AirPort."

Figure 1 The Internet Sharing preference pane

Solution

The name of the physical network interface (such as AirPort or Built-in Ethernet) appears once for each active port configuration that you have created in the Network pane of System preferences. If you have three active port configurations for Built-in Ethernet named "Ether1", "Ether2", and "Ether3", then "Built-in Ethernet" appears three times in the message. What this actually indicates to you is that your connection is being shared over each active port configuration for the named interface. For more information, see technical document 106800, "**Mac OS X: How to Create Port Configurations**".

Important: Users of AirPort should only use one port configuration for AirPort. It is not possible to create multiple AirPort configurations in Mac OS X 10.2, though you could have still have them if they were created in Mac OS X 10.1 and imported during an upgrade installation. Use of multiple AirPort port configurations may result in unexpected behavior. For best performance, turn off and delete additional port configurations for AirPort.

Mac OS X: Unexplained Hard Disk Activity Produced By "find" Process

You may notice brief periods of intense, unexplained hard disk activity as a result of normal operating system maintenance.

This article has been archived and is no longer updated by Apple.

Symptom

- You hear a brief period of intense hard disk activity, lasting up to about a minute. There is no alert message to explain the activity. This may occur when no other applications are open or when all other applications are idle.
- If you look in Process Viewer or use the top command, you see that the process "find" is using significant CPU time during this activity.
- Users familiar with Sherlock scheduled indexing may confuse this activity with that feature.

Solution

The disk activity generated by find is a normal part of file system maintenance, used for tasks such as removing invisible temporary files that are used by the system. It is scheduled to occur early in the morning at 03:15 everyday, 04:30 on Saturdays, and 05:30 on the first day of each month.

For information on how to manually run these jobs at a time of your choice, see technical document 107388, "**Mac OS X: How to Force Background Maintenance Tasks (Logs and Temporary Items)**".

These scheduled tasks should not be confused with the Sherlock scheduled indexing feature. For more information, see technical document 106190, "**Mac OS X 10.0: Performance Slower When Sherlock Updates or Creates an Index**".

Note: Mac OS X 10.2 replaces the Sherlock indexing feature with a find by content option in the Find dialog of the Finder.

Mac OS X 10.2: Third-Party Menu Bar Items Do Not Work

The Mac OS X 10.2 menu bar does not allow third-party menu bar items that worked with Mac OS X 10.1, such as those added by shareware utilities.

This article has been archived and is no longer updated by Apple.

Symptom

- Third-party menu bar items do not appear after upgrading to Mac OS X 10.2.
- If you try to open the preference pane for a third-party menu bar item, an alert box may appear. Using Application Switcher Menu (Frank Vercruesse, author) as an example, the message in the alert box says:

  "Preferences Error. Could not load ASM."

Solution

Mac OS X 10.2, in its original and supported state, does not allow the addition of third-party menu bar items.

Important: Though third-party solutions exist for re-enabling third-party menu bar items, Apple does not recommend, endorse, or provide technical support for use of such solutions or for complications arising from the use of such solutions. Using third-party solutions to modify Mac OS X may result in unforeseen consequences, including but not limited to the inability to install future Apple software updates.

Mac OS X Server 10.2: Cannot Add Email Addresses in Server Monitor

Deleting all the email addresses in Server Monitor keeps you from adding any new addresses.
This article has been archived and is no longer updated by Apple.

Symptom

When you set up email notifications for Server Monitor in Mac OS X Server 10.2, if you delete all the email addresses from the "To" field, you are unable to add any new addresses. Clicking the Add button does not add a new addresses.

Solution

1. Quit Server Monitor. If more than one instance of Server Monitor is connected (local and remote), be sure to quit them all.
2. Delete these files from the server:
   - /Library/Preferences/Server Monitor Prefs
   - /etc/hwmond.conf

Notes

1. Deleting these files will remove all customized settings in Server Monitor. After deleting these files, you must add your server to the list again.

2. When Server Monitor is used on a remote system, there is a local preference file that must be updated after deleting the files on the server. To update the preference file on the remote system, open Server Monitor and select Edit Notifications for the affected server. You now should be able to successfully add a new email address. If you cannot add new addresses, delete the following file on the remote workstation while Server Monitor is not open:

/Library/Preferences/Server Monitor Prefs

Apple Remote Desktop 1.2 or Earlier: How to Remotely Configure on Mac OS X Server 10.2

This document explains how to remotely configure Apple Remote Desktop (ARD) versions 1.2 or earlier on Mac OS X Server 10.2 or later. When set up via these instructions, the server is available as an Apple Remote Desktop client.

Note: This document does not apply to ARD versions 1.2.1 to 1.2.4 or version 2.0 or later.
This article has been archived and is no longer updated by Apple.

This document explains how to remotely configure Apple Remote Desktop (ARD) versions 1.2 or earlier on Mac OS X Server 10.2 or later. When set up via these instructions, the server is available as an Apple Remote Desktop client.

Note: This document does not apply to ARD versions 1.2.1 to 1.2.4 or version 2.0 or later.

These instructions assume you have already installed Apple Remote Desktop. If you have not, see the Xserve manuals for instructions on how to remotely install Apple Remote Desktop.

Steps for remotely configuring ARD:

1. From your remote computer, make an ssh connection to Xserve. The command is:

   ```
   ssh root@server_address
   ```

   Note: Replace "server_address" with the actual IP address or DNS name of Xserve.

2. Provide your root password when prompted. Unless you have changed it, the root password is the same as that of the first Admin user created for Xserve.

3. In order for ARD to be on after every startup, the hostconfig file must be edited. It must include the line "ARDAGENT=-YES-". You can do this by using a CLI text editor (such as pico or vi). This example uses pico. The command is:

   ```
   pico /etc/hostconfig
   ```

4. Press the down arrow (cursor) key to scroll to the end of the file. On a new line type:

   ```
   ARDAGENT=-YES-
   ```

5. Save the file (press Control-O), press Return, and exit pico (press Control-X).

6. You must add a NetInfo property and value. In this example the user to be configured has a short name of "stewart". You would execute this command, replacing "stewart" with the short name of your chosen user:

   ```
   niutil -createprop . /users/stewart naprivs -1073741569
   ```

7. Restart the Xserve by typing this command then pressing Return:

   ```
   shutdown -r now
   ```

8. After the Xserve restarts, open ARD. Add the Xserve, using the username and password of your chosen user (stewart in this example).

Mac OS X 10.2: Some users cannot use Classic

When using the Classic environment to install software updates, installing Mac OS 9 system software updates or reinstalling Mac OS 9 may cause privilege changes to the Classic System Folder that prevent some users from using the Classic environment.

This document applies to Mac OS X 10.2 through 10.2.2.
This article has been archived and is no longer updated by Apple.
This message may appear when trying to start Classic, "You do not have sufficient permissions to run Classic from the selected system folder."

To fix this, download and install Mac OS X 10.2.3 Update, or later.

Published Date: Oct 10, 2016

Mac OS X 10.2, Remote Desktop: System Preferences Quits Unexpectedly When Accessing Remote Desktop Pane

The System Preferences application quits unexpectedly when an Apple Remote Desktop version earlier than 1.1 is installed. Mac OS X 10.2 works with Apple Remote Desktop 1.1 or later.
This article has been archived and is no longer updated by Apple.

Symptom

After upgrading to Mac OS X 10.2, System Preferences unexpectedly quits if you try to open the Remote Desktop pane.

Solution

Use the Software Update pane of System Preferences to update to Apple Remote Desktop 1.1. See technical document 106704, "**Mac OS X: How to Update Your Software**".
Published Date: Feb 17, 2012

Mac OS X Server 10.2: Software Update Changes Apache Document Root Behavior

Be cautious when modifying preinstalled items at /Library/WebServer/Documents. Items preinstalled in this location are subject to change or reinstallation by future Apple software updates.

This article has been archived and is no longer updated by Apple.

Symptom

If you have modified preinstalled items (such as a symlink) at /Library/WebServer/Documents, then you may encounter unexpected behavior after installing a Mac OS X Server software update.

Solution

If you have modified preinstalled items in the folder /Library/WebServer/Documents, you should back up the folder as a precaution before installing system software updates.

When Apple releases software updates available for Mac OS X Server, they often include a later version of the Apache Web server and the included online Apache manual. The content for the manual is in the /Library/Documentation/Services/apache/ folder, but by default Apache serves content from /Library/WebServer/Documents/. That folder contains a symbolic link (symlink) pointing to the manual. That symlink and the other files originally installed in that folder, including index.html, are subject to being overwritten in the event of a software update. If you modify them, they are subject to being restored to their original content. Certain changes, such as changing a symlink to a folder, may confuse the update process and result in a new symlink being created with a new name. While it is safe to add files and folders to /Library/WebServer/Documents, be cautious when modifying the preinstalled files and folders.

Mac OS X 10.2: inetd Replaced by xinetd

Mac OS X 10.2 replaces inetd with xinetd, providing easier modification of the inetd daemon list.
This article has been archived and is no longer updated by Apple.
Mac OS X 10.2 replaces inetd with xinetd. The xinetd process offers an easier way to add, delete, or modify entries in the inetd daemon list. Rather than editing a single file (/etc/inetd.conf), a directory can have xinetd "modules" dropped into it or removed in order to change the configuration, making it much easier to modify system behavior. The xinetd process also add features such as access control and logging. For information on configuring and using xinetd, see the man pages for xinetd and xinetd.conf, or visit xinetd (http://xinetd.org/).

Services on Mac OS X that formerly were configured with inetd, such as FTP, now use xinetd. Though you should use xinetd, inetd is still running, and may be used to run services alongside xinetd if inetd.conf is configured appropriately.

Mac OS: Find by Content Index Limited to 2000 Unique Terms

To protect performance and disk space usage, all Mac OS applications that use find by content have a 2000-term index limit. This includes all versions of Sherlock, Mac Help, Mail, and the Mac OS X 10.2 Find dialog.

This article has been archived and is no longer updated by Apple.

"Find by content" indexing allows you to locate a file by the words it contains. You could, for example, locate your meeting notes by typing a phrase contained in them. All Mac OS applications that feature find by content indexing use the same underlying engine. These applications include:

- Sherlock - see Note
- Mac Help
- Mail
- the Find dialog - see Note

Note: In Mac OS X 10.2 and later, the Find dialog of the Finder assumes the find by content function that was previously part of Sherlock. To learn more about it, see technical document 107005, "**Mac OS X 10.2: How to Find Items on the Hard Disk**".

Only the first 2000 unique terms of each file are indexed. During this process, a file's text is processed into "terms." This means they are forced to all lower-case, and they may be "stemmed" by removing certain grammatical endings. Thus "BROTHERS", "brother", "Brother's", and "Brother" would be considered the same term, "brother."

"Unique" means that for purposes of the 2000-term limit, each term is only counted the first time it is found. So the indexing process does not stop after the first 2000 terms of a file, but rather when its vocabulary exceeds 2000 terms.

Very few natural language documents have a vocabulary in excess of 2000 words, so this limitation should not hinder you in normal usage. If you were to index a dictionary of the English language, for example, most of it would not be indexed. The same is true of documents containing long lists of names.

The limit is necessary in order to limit the size of index files, and the time required to create them. An index all of the hypothetical English dictionary would be huge. This limit also helps prevent an excess of indexed terms from files that are not natural language documents, and thus that you would not want to index. Such files may be computer-generated, containing many thousands of strings that look like words, but are not.

Open Directory Assistant: Use Only to Configure Mac OS X Server 10.2 or Later

You should only use the Open Directory Assistant application to configure Mac OS X Server.
This article has been archived and is no longer updated by Apple.

Symptom

If you use Open Directory Assistant to configure a non-server installation of Mac OS X, it will not configure the system.

Note: Open Directory Assistant is installed with the Mac OS X Server Admin Tools.

Solution

You should only use the Open Directory Assistant to configure Mac OS X Server.

Note: You may use Open Directory Assistant remotely from a Mac OS X client to configure a Mac OS X Server.

Though Open Directory Assistant allows selection of non-server systems, only Mac OS X Server includes software components required for the Open Directory Assistant to work.

Mac OS X 10.2: Erroneous "You are now running on reserve battery power" Alert

You may see an alert box with a message that says: "You are now running on reserve battery power," even if the battery still has an ample charge.
This article has been archived and is no longer updated by Apple.

Symptom

You see an alert box with a message that says "You are now running on reserve battery power," but your battery still has ample charge. This usually happens when waking from an extended period of sleep, or after unplugging the AC adapter.

Solution

Update to Mac OS X 10.2.4 or later.
Published Date: Oct 10, 2016

Mac OS X: No Modem Sound on PowerBook G3 Series

You cannot hear modem dialing sounds on PowerBook G3 Series computers when using Mac OS X.

This article has been archived and is no longer updated by Apple.

Symptom

No modem sound is heard through speakers or headphones.

Solution

Tthis document will be updated as more information becomes available.

Mac OS X 10.2: Empty Manufacturer and Model Menus in Audio MIDI Setup

If you create a new MIDI device in Audio MIDI Setup and double-click the device icon, the Manufacturer and Model menus are empty.
This article has been archived and is no longer updated by Apple.

Symptom

Manufacturer and Model menus for a newly-created MIDI device are empty.

Solution

This is normal behavior. In a future release, Apple may populate these menus with common manufacturer names and models. You can still enter those names yourself when creating new devices.

Xserve, Mac OS X Server: Modification date changes on files copied via AFP

This article has been archived and is no longer updated by Apple.

The modification dates of files are changed when copied to a Mac OS X Server 10.1.5 via Apple Filing Protocol (AFP, or Apple file service).

Symptom

File modification dates are changed when files are copied via AFP to an Xserve. The last modified date is changed to the time the file was transferred to the server.

Note: The modification date of the files on the file server are changed, not the files on the client.

Solution

Mac OS X Server 10.2 or later resolves this issue.

Published Date: Oct 10, 2016

Mac OS X Server 10.2: Server Assistant Stops Responding While Setting Up Server

Mac OS X Server 10.2 Server Assistant may stop responding ("hang" or "freeze") when setting up your server if TCP/IP is not enabled on the built-in Ethernet port.
This article has been archived and is no longer updated by Apple.

Symptom

Server Assistant stops responding during server configuration.

Solution

Enable TCP/IP on the built-in Ethernet port while setting up Mac OS X Server 10.2. It is not required that an Ethernet cable actually be connected to the port, so long as TCP/IP is enabled on it.

If your server is currently not responding, follow these steps:

1. Restart the computer using the power or interrupt button.
2. Start up into single user mode by holding the Command-S key combination during startup.
3. Execute fsck at the command line (see below for more information).
4. If fsck repairs anything, run it again until it reports no "problems" were found.
5. After that, restart normally; and Server Assistant will start up again. This time, be sure to enable TCP/IP on the built-in Ethernet port while setting up the server.

How to Use fsck From the Command Line

Once you have reached a command line, follow these steps to use fsck:

1. At the prompt, type: `fsck -fy`
2. Press Return.

The fsck utility will go through five "phases" and then return information about the disk's utilization and fragmentation. If fsck alters, repairs, or fixes anything, it will display the message:

***** FILE SYSTEM WAS MODIFIED *****

Important: If this message appears, repeat the "fsck -fy" command until this message no longer appears (as in Step 4 of the section above). It is normal for your computer to require several "passes" of fsck, because first-pass repairs may uncover additional issues.

3. When fsck reports that no problems were found, type: `reboot`
4. Press Return.

The computer should start up normally and allow you to log in.

Mac OS X 10.2: About Import Addresses and Other Mail Scripts

You may use scripts in the Mail Scripts folder to import addresses or for other purposes, but they are provided "AS IS." Apple does not offer technical support for these scripts.
This article has been archived and is no longer updated by Apple.
Scripts in the Mail Scripts folder may be used but are provided "AS IS."

You may import addresses into Address Book from Microsoft Outlook Express, Eudora, Microsoft Entourage, Claris Emailer, Netscape, or Palm Desktop using the "Import Addresses.scpt". Follow these steps:

1. Open Import Addresses.scpt (/Library/Scripts/Mail Scripts).
2. Script Editor opens. Click Run.
3. Follow the on-screen prompts to choose the source of the addresses that you are importing. The script will import addresses automatically once you answer the prompts.

Notes

1. Depending on the source of the addresses, you may be directed to manually export and import addresses.

2. Depending on the source and number of addresses to import, several minutes may be required for the operation to complete.

3. Address groups may not always import correctly. Create new groups within Address Book if necessary.

Mac OS X 10.2: Taking Screen Shots of Classic Environment Windows

In Mac OS X 10.2 you may successfully take a full-screen shot of a Classic environment window, but you cannot take a partial screen shot.
This article has been archived and is no longer updated by Apple.

Symptom

A partial screen shot (Shift-Command-4) does not successfully capture a Classic window's contents.

Solution

To successfully take a picture of a Classic environment window, take a full-screen shot by pressing Shift-Command-3. A numbered "Picture" PDF file will appear on your desktop for each screen shot. You may then use an image editor to crop the image to the desired view.

Partial screen shots (Shift-Command-4) work with native Mac OS X windows, but they will not capture all of a Classic application window's contents.

Published Date: Oct 10, 2016

Mac OS X 10.2: A Classic Window (or the Display) Appears White or Black when Using Zoom

Classic application windows appear white or black when using the Universal Access Zoom feature. The entire display may be affected if the Classic window is covering it.

This article has been archived and is no longer updated by Apple.

Symptom

- Classic application windows appear white or black when using the Universal Access Zoom feature (if white on black is used).
- If Classic environment windows occupy the majority of the display screen, and are not overlaid by Aqua windows, you may see a white or black screen when Zoom is turned on.

Solution

You may reduce this cosmetic symptom by minimizing or hiding any Classic application window before using Zoom.

Alternatively, you may:

- Zoom out completely (press and hold the Option-Command-minus key combination).
- Disable Zoom using the Universal Access preference pane, or by pressing Option-Command-*.

Mac OS X: Do Not Install Carbon Software While Classic Networking Software Is Running

You may not be able to stop Classic if you install Carbon software while Classic networking software is running.
This article has been archived and is no longer updated by Apple.

Symptom

After installing Carbon software, you are unable to stop the Classic environment, shut down, or restart the computer by the normal commands.

Note: "Carbon" is a type of Mac OS-compatible application that has the potential to work in either Mac OS 9 or Mac OS X, depending on circumstances. If you are not sure about what type of software you have, take the precaution listed below.

Solution

Upgrade to Mac OS X 10.2 to avoid this issue.

If you have not yet installed software on an affected version of Mac OS X (10.1.5 or earlier), then avoid the issue by simply stopping the Classic environment before you install software. To stop Classic:

1. Save any files open in Classic, if necessary.
2. Choose System Preferences from the Apple menu.
3. Choose Classic from the View menu.
4. Click Stop.

Note: This procedure is especially important if the Carbon software you are installing does not require you to restart, because the issue will not appear until the computer is restarted or shut down (or Classic is stopped), which may be at a much later date.

If you have already installed Carbon software on an affected version of Mac OS X with Classic running, you may force quit Classic:

1. Press the Option-Apple-Escape key combination to open the Force Quit Applications dialog.
2. Select Classic Environment.
3. Click Force Quit.
4. Verify that the Carbon software was installed correctly, reinstalling if necessary.
5. Start Classic again.

Mac OS X 10.2: Included Ink Jet printer drivers

Mac OS X 10.2 includes preinstalled drivers for many popular third-party ink jet (raster) printers.
This article has been archived and is no longer updated by Apple.
Mac OS X 10.2 includes drivers from Canon, Epson, Hewlett-Packard, and Lexmark for certain models of their respective printers. The drivers, listed below, are included in the optional Mac OS X software package "Additional Printer Drivers", which is installed by default. If your printer is not listed, check with your printer's manufacturer to see if drivers are available for Mac OS X 10.2.

If you own one of the printers listed below, simply connect it to your Macintosh. Mac OS X automatically sets up Print Center to use the printer. For information on PostScript and Apple LaserWriter printers, see "Mac OS X 10.2: Included PPDs and Use of PostScript Printers".

Tips

In addition to the drivers, printer manufacturers may include a printer utility that you use to adjust various printer features. See "Mac OS X: How to Access Third-Party Ink Jet Printer Utilities".

iPhoto is compatible with a number of printers. All of the HP and Lexmark, the Canon v1.4.1, and Epson v1.29 printer drivers listed below have iPhoto presets.

Some printing features are not included in the versions of the drivers included with Mac OS X 10.2, such as banner printing, booklet printing, and watermarks. Contact the printer manufacturer or visit its Web site to learn more about how to use these features if they are available.

Printer manufacturers may release versions of printer drivers later than the ones listed below. To see if you have the latest drivers for your printer, compare the version number below with that on the printer manufacturer's Web site.

Printer drivers included

1. Lexmark
2. Canon
3. Epson
4. Hewlett-Packard

Lexmark

Mac OS X 10.2: Included PPDs and use of PostScript printers

This article has been archived and is no longer updated by Apple.

Mac OS X 10.2 installs PostScript Printer Description (PPD) files necessary to use many Apple LaserWriter and third-party PostScript printers. This document includes a list of included PPDs and discusses their use.

The Mac OS X print architecture works with many Apple and third-party PostScript printers, specifically those which have these two characteristics:

- Are PostScript Level 2 or 3 printers
- Use PPD files to describe the set of printer features available for a specific PostScript printer or printer family

For example, a PPD file typically describes printer features including:

- The paper-handling capabilities of a printer
- The number of paper trays and their capacity
- Available paper sizes they handle

PPD files are created by printer manufacturers. Mac OS X 10.2 includes PPD files from Apple, Hewlett-Packard, Lexmark, Tektronix, and Xerox. A list of these printers can be found below. For information on ink jet printers, see "Mac OS X 10.2: Included Ink Jet Printer Drivers".

Choosing a PPD File

Mac OS X may automatically select the proper PPD for USB- and AppleTalk-connected printers. Print Center can usually determine the model name of a connected printer, and a matching PPD. An advantage of automatic PPD selection is that when a PPD file is not found in the Mac OS X system, it then searches in the Classic (Mac OS 9) System Folder, provided the Classic environment has been used at least once, or that the Classic System Folder has been selected at least once in Startup Disk preferences. For these and other reasons, you should allow Mac OS X to use its automatic selection capabilities when the proper PPD is available.

When adding a printer that is connected to a computer via AppleTalk, the PPD will be selected automatically for you, unless you choose one specifically from the Printer Model pop-up menu.

When USB PostScript printers that use TBCP (tagged binary control protocol) are connected to your computer for the first time, a printer queue is created automatically, and the proper PPD is associated with that printer. If that printer's PPD is not available, the Generic PPD will be automatically associated with that printer and queue. Check your printer's specifications to see if it uses TBCP. To work with Mac OS X, a USB PostScript printer must use TBCP. Those that do not may not print. If necessary, contact the printer manufacturer for Mac OS X compatibility information.

In contrast to the automatic selection of PPDs for USB and AppleTalk connected printers, you must manually select the printer's PPD file when adding "LPR Printers using IP". For best results, choose the PPD file that is provided specifically for that printer from the Printer Model pop-up menu. When the specific PPD file for your printer is not available, consider choosing the Printer Model that most closely resembles your printer. Selecting the PPD intended for a model of printer similar to yours will often provide you access to more of your printer's capabilities than merely selecting the Generic PPD, which is designed for maximum compatibility with a wide range of PostScript printers.

Printer not listed?

If your printer is not listed below, try choosing the PPD of a printer that has a feature set similar to your printer. Using a PPD that is not designed specifically for your printer may not provide access to all of your printer's features, and unforeseen problems may be encountered. Before choosing this workaround, check with the manufacturer of your printer to see if they have released a printer-specific PPD for Mac OS X.

Some printer features not available?

Bundled PPDs may not offer every feature of a printer, such as sheet feeders or built-in fax machines. If your printer has a feature that is not available, contact the printer manufacturer for more information regarding the use of that feature. In the case of the LaserWriter 16_600 PS Fax, for example, Apple does not include the built-in fax feature when that PPD is used with Mac OS X.

Renaming or reconfiguring your print queue

With Mac OS X 10.2 you can change existing print queues.

PPDs Included with Mac OS X 10.2

This list is subject to change. You may always check with a printer manufacturer to see if a later version of the PPD has been released.

Mac OS X 10.2: Network Printers Do Not Appear in Printer List After Upgrade

After upgrading from Mac OS X 10.1 to 10.2, you must re-add any network printers that you set up in Mac OS X 10.1. In addition, some printers may require updated drivers.
This article has been archived and is no longer updated by Apple.

Symptom

Network printers that were added to Print Center in Mac OS X 10.1 no longer appear in the Printer List after upgrading to Mac OS X 10.2.

Solution

Add your network printers to the Print Center list after upgrading. Printers that are directly connected via USB will automatically appear in the Print Center list.

Note: Some printers may also require later versions of drivers than the ones that worked in Mac OS X 10.1. Mac OS X 10.2 includes drivers for many third-party printers. If a driver is not included for your printer, please contact the printer vendor to get the current compatible driver for your printer. For a list of included drivers, see these technical document documents:

107001: "**Mac OS X 10.2: Included Ink Jet Printer Drivers**"
107002: "**Mac OS X 10.2: Included PPDs and Use of PostScript Printers**"
Published Date: Oct 10, 2016

Changing the Print Center print queue in Mac OS X 10.2

In Mac OS X 10.2 you can change the configuration of an existing print queue. This includes tasks such as:

- Associating a different PPD with PostScript printers
- Renaming the queue
- Configuring installable options

This article has been archived and is no longer updated by Apple.
For example, to associate a different PPD with a PostScript printer queue:

1. Open Print Center (/Applications/Utilities/).
2. Select the printer from the Printer List.
3. Choose **Show Info** from the **Printers** menu.
4. Choose PPD from the pop-up menu in the Printer Info window.
5. Choose a new PPD from the Printer Model pop-up menu.

By using the same procedure to access the Printer Info window, you may change the name of the print queue, enter a description of the printer's location, and configure the printer's installable options (such as optional paper cassettes, memory configuration, or a duplex printing unit).

Tip: To modify a print queue in Mac OS X 10.0 to 10.1.5, you must delete the queue from Print Center then select the preferred settings (as applicable for the version of the operating system) when creating the new queue.
Published Date: Oct 10, 2016

Mac OS X 10.2: Cannot Change the Preferred Language

If you choose to update only one language when installing Mac OS X 10.2 over an existing Mac OS X 10.1 volume that included other languages, you may later encounter issues with changing the default language.
This article has been archived and is no longer updated by Apple.

Symptom

After upgrading to Mac OS X 10.2, you cannot change the preferred language in System Preferences.

Note: Though one language is used as the example, this may occur any time you choose to upgrade fewer languages than were previously installed.

Solution

When installing, you should update the languages that you have previously installed. To resolve this, start up the computer from the Mac OS X 10.2 Install or Upgrade CD and perform a standard reinstallation of Mac OS X 10.2. All languages will be available after the installation.

Note: The Mac OS X 10.2 Installer requires a minimum of Mac OS X 10.1 to perform an upgrade installation. See technical document 106037, "**Mac OS X 10.2: Upgrade Installation Requires Mac OS X 10.1**".
Published Date: Oct 10, 2016

Mac OS X 10.2: Classic Cannot Connect or Print via AppleTalk After Sleep

You may occasionally experience a loss of AppleTalk connectivity in the Classic environment after the computer wakes from sleep.
This article has been archived and is no longer updated by Apple.

Symptom

Classic cannot access an AppleTalk network after waking from sleep.

For many people, the first sign is an alert that says you cannot print from a Classic application to an AppleTalk printer. Depending on circumstances, you may or may not see the general alert that access to your AppleTalk network has been interrupted.

Solution

Download and install Mac OS X 10.2.1 or later.

Mac OS X 10.2 (Japan): Internet Sharing Issue With NTT FLET‘S Internet Service Provider

This document explains how to correct a packet transmission issue that occurs when using Internet Sharing with the NTT FLET'S Internet service provider (ISP).
This article has been archived and is no longer updated by Apple.

Symptom

The computer that is sharing its connection may connect to the Internet, but client computers (those that are using the shared connection) experience these issues:

- Web pages load only partially, or not at all.
- Sherlock cannot search the Internet.
- Automatic Software Update does not work.
- iTunes cannot connect to Internet radio.

You may notice other Internet-related issues.

Solution

Update to Mac OS X 10.2.5 or later.

Mac OS X 10.2: Ink Handwriting Recognition Requires Installation of Graphics Tablet Drivers

In order to use Ink handwriting recognition included with Mac OS X 10.2 you need to install appropriate drivers for your graphics tablet.

This article has been archived and is no longer updated by Apple.

Symptom

Ink appears to be ready, but you cannot use it.

Note: Ink does not appear in System Preferences unless a graphics tablet is connected to the computer. The connection of a graphics tablet for which drivers have not been installed may cause Ink to appear, but you still would not be able to use Ink.

Solution

Install the latest drivers available for your graphics tablet.

Mac OS X Server: How to Install, Enable, and Configure SNMP

This document explains how to set up the Simple Network Management Protocol (SNMP) on Mac OS X Server.
This article has been archived and is no longer updated by Apple.

Installing SNMP

To use SNMP for monitoring or data collection, an SNMP agent (snmpd) must be running on the monitored Mac OS X Server host (computer). Mac OS X Server 10.1.5 or later includes a version of SNMP (UCD-SNMP v. 4.2.3 or later).

If you do not have the file /usr/sbin/snmpd, then SNMP is not installed.

The following operating systems require that SNMP be built and installed:

- Mac OS X Server 10.1.4 or earlier

If you have access to a Mac OS X Server 10.1.5 or later Admin CD , the SNMP package on the CD may be used to install UCD-SNMP 4.2.3 on these systems.

Note: Mac OS X Server 10.1.5 is available only with Xserve computers shipped before the release of Mac OS X Server 10.2.

If you do not have access to the CD, you may download current SNMP source from the NET-SNMP Project Home Page (http://www.net-snmp.org/).

Note: Apple only provides technical support for the SNMP tools on the Admin CD when they are used with Mac OS X Server 10.1.5 or later.

Warnings

1. Once SNMP is active, anyone with a route to the SNMP host will be able to collect SNMP data from it. To learn more, consult the various SNMP information sources listed below.

2. The default configuration of snmpd uses privileged port 161. For this reason and others, it must be executed by root or using setuid. You should only use setuid as root if you understand the ramifications. If you do not, seek assistance or additional information. There are flags available for snmpd that will change the uid and gid of the process after it starts. See the snmpd man page for more information.

Starting snmpd

Follow these steps for Mac OS X Server 10.1.5 or later:

1. Open the file: /etc/hostconfig

2. Locate the line:

```
APPLETALK_HOSTNAME
```

3. Immediately above, add this new line:

```
SNMPSERVER:=-YES-
```

4. Save the file.

Note: For further instruction on editing configuration files, including important precautionary statements, see technical document 106619, "**Mac OS X Server: How to Edit Configuration Files**".

This change to hostconfig causes snmpd to be executed during system startup, with no options, as dictated by the file /System/Library/StartupItems/SNMP/SNMP.

As an alternative, the snmp agent (/usr/sbin/snmpd) can be executed at the command line at any time.

Configuring snmpd

The configuration (conf) file for snmpd is typically at /usr/share/snmp/ and named "snmpd.conf" or "snmpd.local.conf". If you have an environment variable SNMPCONF, snmpd will read any files named "snmpd.conf" and "snmpd.local.conf" in these directories. The snmpd process can be started with a "-c" flag to indicate other conf files. See the snmpd man page for more information on which conf files can be used.

Configuration files can be created and installed more elegantly using the included script /usr/bin/snmpconf. As root, use this script with the "-i" flag to install the file at /usr/share/snmp/. Otherwise the default location for the file to be written is the user's home directory (~/). Note that only root has write permission for /usr/share/snmp/.

Since snmpd reads its conf files at startup, changes to the conf files require that the process be stopped and restarted. You may stop snmpd with ProcessViewer or at the command line (kill -HUP <pid>).

Example of SNMP Configuration

I. Customize data

To customize the data provided by snmpd, you may add an snmpd.conf file using /usr/bin/snmpconf. As root or using sudo, execute this command:

```
/usr/bin/snmpconf -i
```

You will then see a series of text menus. Make these choices in this order:

1. Select File: 3 (snmpd.conf)
2. Select section: 5 (System Information Setup)
3. Select section: 1 (The [typically physical] location of the system.)
4. The location of the system: type text string here -- such as "server_room"
5. Select section: f (finish)
6. Select section: f (finish)
7. Select File: q (quit)

Notice you have created an snmpd.conf file with creation date of today: ls -l /usr/share/snmpd.conf

II. Start snmpd as root

To start snmpd, execute this as root:

```
/usr/sbin/snmpd
```

If snmpd is already running, HUP the process instead:

```
set x=`ps cax |grep snmpd |awk '{print $1}'` ; kill -HUP $x ;
```

Note that the snmpd process is now running:

```
ps ax |grep snmpd
```

III. Collect SNMP information from the host

To get the SNMP-available information you just added, execute this command from a host that has the SNMP tools installed:

```
/usr/sbin/snmpget hostname public system.sysLocation.0
```

Note: You would replace "hostname" with the actual name of the target host.

You should see location you provided. In this example, you would see:

```
system.sysLocation.0 = server_room
```

The other options in the menu you were working in are:

```
/usr/bin/snmpget hostname public system.sysContact.0
/usr/bin/snmpget hostname public system.sysServices.0
```

The final ".0" indicates you are looking for the index object. The word "public" is the name of the snmp community which you did not alter. If you need information on either of these or explanations of snmp syntax, there are tutorials available on net-snmp.sourceforge.net.

Additional tools

Other than snmpget, there are a variety of snmp based tools and suites both free and commercial with varying complexity and reporting:

Intermapper by Dartware
http://dartware.com/

HP OpenView mrtg and rrdtool
http://people.ee.ethz.ch/~oetiker/webtools/mrtg/

You may also search for perl modules.

Additional information

Man pages

man -k snmp will provide a list of the known man pages.

Mac OS X 10.2, 10.3: Mac Help Viewer unexpectedly quits

This article has been archived and is no longer updated by Apple.
Does Mac Help Viewer quit unexpectedly when you try to use it from within an application? Learn what you can do if this happens to you.

Note: This document applies to Mac OS X 10.2 through 10.3.9.

Note: "Help Viewer" refers to the Apple (Mac) Help Viewer. Third-party applications such as Microsoft Entourage may use their own help viewers. To see a list of applications that have installed content for the Apple Help Viewer, click the Finder icon in the Dock, Choose Mac Help from the Help menu, then click the Help Center button in the Toolbar of the Help Viewer. **Mac OS X 10.2**

Update to Mac OS X 10.2.1 or later. For more information, see "Mac OS X: How to Update Your Software".

You should also make sure that you are using the latest version of any third-party application in which this issue occurs or which adds Help content to Mac Help Viewer.

Mac OS X 10.3 through 10.3.9

This can be caused by a problematic cache or "Help book".

First, troubleshoot the cache. Just do this:

1. Quit Help Viewer, if it's not already quit.
2. From the Finder's Go menu, choose Home.
3. Open the Library folder.
4. Open the Caches folder.
5. Look for the "com.apple.helpui" folder.
6. Rename that little folder to something else, such as "old Help cache folder".
7. Open Help Viewer. Does the issue return?

If the issue is gone, you're all done!

If the issue persists, use these easy steps to troubleshoot for a problematic Help book. Having a problematic Help book in a Help folder can cause Help Viewer to quit, even if you are opening an unrelated help book.

1. Quit Help Viewer, if it's not already quit.
2. From the Finder's Go menu, choose Home.
3. Open the Library folder.
4. Open the Documentation folder.
5. Open the Help folder.
6. Double-click each Help book (one at a time) to open Help Viewer.
7. When you find one that makes Help Viewer quit unexpectedly, take it out of the folder. Put it in the Trash, for example.

Tip: If you don't see any Help books here, do this instead:

1. Quit Help Viewer, if it's not already quit.
2. From the Finder's Go menu, choose Computer.
3. Open your Mac OS X volume.
4. Open the Library folder.
5. Open the Documentation folder.
6. Open the Help folder.
7. Double-click each Help book (one at a time) to open Help Viewer.
8. When you find one that makes Help Viewer quit unexpectedly, take it out of the folder. Put it in the Trash, for example (you may be prompted for an administrator password).

If this doesn't work either, skip to "A third solution" below.

I removed the Help book(s) that caused the issue, but now that book's Help content is gone. How do I get it back?

Once you've isolated the issue to the specific Help book and deleted it, reinstall it (from its application installer if an application-specific book, or from Mac OS X if it came with Mac OS X). Remember, it's usually best to use the latest versions of third-party software products.

A third solution

No luck with the cache or Help book fixes? Most of the time they should work, but if not you can try this:

1. Quit Help Viewer, if it's not already quit.
2. From the Finder's Go menu, choose Home.
3. Open the Library folder.
4. Open the Preferences folder.
5. Delete these files:
    - com.apple.help.plist
    - com.apple.helpui.plist
    - com.apple.helpviewer.plist

Tip: Troubleshooting preference files is much less likely to be useful than troubleshooting Help books and Help caches.

25667 Mac OS X: Can't Access Help Content

Published Date: Oct 10, 2016

Mac OS X Server 10.2: About Apache 2

Mac OS X Server 10.2 includes Apache 2 (v 2.0.36) for evaluation purposes.
This article has been archived and is no longer updated by Apple.
Mac OS X Server 10.2 installs Apache 2 (v 2.0.36) for evaluation purposes, in addition to Apache 1 (v 1.3.23), which is used by default. Apache 2 is disabled, and the Server Settings application works only with Apache 1.

If you want to try Apache 2, note the following:

- It is installed in a separate location in the file system: `/opt/apache2`
- It is not connected to Server Settings.
- It serves Web pages from `/opt/apache2/htdocs`.
- Its config is at: `/opt/apache2/conf/httpd.conf`
- It is controlled by its own version of the apachectl script, so to start it type the following:

  ```
  sudo  /opt/apache2/bin/apachectl start
  ```
- Although it's possible to use both versions of apache, you should be cautious when doing so, and make sure the two versions do not attempt to listen on the same port. Both are configured to listen on port 80, so do one of the following:

  1. Edit `/opt/apache2/conf/httpd.conf` and change the Listen directive, or

  2. Use the Web panel in the Server Settings application to change the port of all your virtual hosts to something other than 80.

Published Date: Oct 10, 2016

Mac OS X Server 10.2: Editing Apache configuration files

Experienced Apache administrators can use these notes on editing Apache's configuration files to work with features of the Apache web server that are not included in Server Settings.

This article has been archived and is no longer updated by Apple.

When Apache starts on Mac OS X Server, it uses a customized /etc/httpd/httpd.conf, which differs significantly from the httpd.conf distributed with Apache and the httpd.conf that resides on Mac OS X computers. This customized file contains some global directives, then includes httpd_macosxserver.conf. When you use Server Settings to configure Web service, httpd_macosxserver.conf is the file that is updated.

To edit Apache configuration files manually:

- When making global configuration changes in httpd.conf or httpd_macosxserver.conf, observe the comments in these files. The comments indicate what is safe and unsafe to modify.
- When making virtual-host-specific changes in httpd.conf or httpd_macosxserver.conf, follow the guidelines that appear at the top of these files. The guidelines describe how to avoid conflicts with Server Settings.
- If you install software updates, your /etc/httpd/ folder may contain configuration files that are not valid for Mac OS X Server. For example, httpd.conf.default, httpd.conf.old, mime.types.default, and mime.types.old. Only the following files, located in /etc/httpd/, are used to configure Mac OS X Server Web service: httpd.conf, httpd_macosxserver.conf, mime.types, mime_macosxserver.types, and tomcat.conf.

Published Date: Oct 10, 2016

Mac OS X Server 10.2: Creating Indexes for Searching Web Site Content

This document offers notes on creating Indexes for Searching Web Site Content.
This article has been archived and is no longer updated by Apple.
Mac OS X Server 10.2 continues to work with the mod_sherlock_apple Apache module, which allows Web browsers to search the content of your Web site. As in previous versions of the server, you must produce a content index before content searching is possible.

Content indexes in earlier server versions were created in Sherlock. Content indexes are now created using the Finder. Select the folder containing the files you want to index, then choose Get Info from the File menu. Click Content Index, then click Index Now.

In addition, there are new constraints that restrict the creation of index files. To create an index, you must be the owner of the folder and must own any files in that folder that are to be indexed. In the case of content in the /Library/WebServer/Documents folder, the folder and all the files within it are owned by root. Even though the folder and files can be written to by members of the admin group, you must still be logged in as root to create a content index.

Creating an index remotely or on a headless server is done using a command-line tool named indexfolder. See the man pages for usage details. The operation of indexfolder is affected by the login window. If nobody is logged in at the login window, the tool must be run as root. If an Admin user is logged in at the login window, the tool must be run as that Admin user. Otherwise, the tool will fail with messages similar to these:

kCGErrorIllegalArgument : initCGDisplayState: cannot map display interlocks.
kCGErrorIllegalArgument : CGSNewConnection cannot get connection port

Whether done from the Finder or the indexfolder tool, content indexing creates a folder named .FBCIndex either in the folder to be indexed or in one of its parent folders.

Mac OS X Server 10.2 or later: About the Web Service access_log format

This document offers notes on the Web Service access_log Format in Mac OS X 10.2 or later.
This article has been archived and is no longer updated by Apple.
In Mac OS X Server 10.2 or later, the web performance cache does not prevent a remote client's IP address from being logged in the access_log. The web performance cache process adds an HTTP header named "PC-Remote-Addr" that contains the client's IP address before passing a request to the Apache web server.

So, with the performance cache disabled, the standard log format string on the CustomLog directive in httpd_macosxserver.conf is as it was in version 10.1:

```
%h  %l %u %t "%r" %>s %b
```

But when the performance cache is enabled, as it is by default, the "%h" item would extract the local computer's IP address. To extract the remote client's IP address, the log format string needs to be modified:

```
%{PC-Remote-Addr}i  %l %u %t "%r" %>s %b
```

When you use the Server Settings application (in 10.2) or Server Admin (in 10.3) to enable and disable Web performance cache for each site (virtual host), the CustomLog directive in httpd_macosxserver.conf for each site is automatically adjusted to the correct format string, so this is normally transparent, and your access logs should always contain the correct remote client address.
Published Date: Oct 10, 2016

Mac OS X 10.2: "error code 1016" Alert

When you try to use certain control panels in Classic, you may see an alert box with a message that contains "error code 1016" if you have managed Classic preferences.
This article has been archived and is no longer updated by Apple.

Symptom

If a client with managed Classic preferences tries to use the Extensions Manager, File Sharing, or Software Update control panels, she sees an alert box with a message that says:

> "The operation could not be completed. An unexpected error occurred (error code 1016)."

Solution

This message indicates that an Admin user has restricted access to the item you tried to use. Non-Admin users may not use these control panels when Classic preferences are managed. You may also see the message if the Admin has selected "Hide Chooser and Network Browser" in Workgroup Manager.

The message also appears if you try to open an unapproved application (one that is not listed in the Items pane of the Applications preference in Workgroup manager) in either Classic or Mac OS X.

Mac OS X Server 10.2: How to Reset the Admin Password When Discontinuing Use of Password Server

This document explains how to reset the Admin password when discontinuing use of Password Server.
This article has been archived and is no longer updated by Apple.
If you want turn off Password Server, make sure you change the Password Server administrator's password validation method before doing so.
This ensures that the administrator can continue to log in to Mac OS X Server.

Follow these steps:

1. Open Workgroup Manager.
2. Select the administrator's account, and open it.
3. Click the Advanced tab.
4. Change the setting for "Use password type" from Password Server to Basic.
5. Reset the administrator's password.

Apple Remote Desktop 1.1: Reinstall After Upgrading to Mac OS X 10.2

If you have installed Apple Remote Desktop 1.1 on Mac OS X 10.1, you must reinstall it after upgrading to Mac OS X 10.2.
This article has been archived and is no longer updated by Apple.

Symptom

Apple Remote Desktop does not work as expected after upgrading from Mac OS X 10.1 to Mac OS X 10.2.

Solution

The Apple Remote Desktop Installer chooses between two versions of its preference file, and installs the version that is appropriate for your system, according to whether it is version 10.1 or 10.2. When your an existing installation of Mac OS X 10.1 with Apple Remote Desktop 1.1 is updated to 10.2, you must reinstall Apple Remote Desktop 1.1 to get the correct preferences file. You may do this two ways:

- Reinstall from the full Apple Remote Desktop 1.1 Installer, or
- Use the Apple Remote Desktop 1.1 Updater.

Macintosh Manager 2: "Error -23045" Alert

An "error -23045" alert may appear during a Macintosh Manager login if the user's Home directory permissions make it inaccessible.
This article has been archived and is no longer updated by Apple.

Symptom

When a user tries to log in to Macintosh Manager, an alert box with this message appears: "error -23045", and the user cannot log in.

Solution

To resolve the issue, examine these three areas:

1. Locate the user's Home directory and verify permissions on the share point containing the home directory. If only one user is affected, compare the privileges of that user's Home directory to that of one on the same sharepoint that works. For more information on troubleshooting privileges, see technical document 106712, "**Mac OS X: Troubleshooting Permissions Issues**".

2. If your server uses a RAID device or an external hard drive (such as a FireWire hard drive), then review technical document 106604, "**Mac OS X Server 10.1: Setting Privileges to Share FireWire or RAID Hard Disks and Other Removable Media**".

3. In NetInfo Manager, verify that the home_loc property and value of the user's record is consistent with the network address of the server.

Apple Remote Desktop: How to Enable the Request Attention Menu

This document explains how to enable the Request Attention menu on Mac OS X Apple Remote Desktop clients. This menu allows users to see when they are being observed in Mac OS X.
This article has been archived and is no longer updated by Apple.

Recognizing the Request Attention menu

In Mac OS X, the Apple Remote Desktop Request Attention menu icon is a balloon alert (Figure 1).

Figure 1 The Request Attention menu

If the Remote Desktop preference pane is configured to show when the client being observed, the menu's icon can change into a pair of binoculars (Figure 2). This occurs only when the client is being observed, similar to the eyes that may appear in Apple Network Assistant.

Figure 2 The Request Attention menu when being observed

How to enable the menu

Update to Remote Desktop 1.1. This is available via Automatic Software Update. See technical document 106704, "**Mac OS X: How to Update Your Software**".

If updating in itself does not automatically enable the Request Attention menu, you must manually enable it. This is achieved by opening "RemoteDesktop.menu" at least once on every client. Follow these steps at a client:

1. Click the Finder icon in the Dock.
2. Choose Go to Folder from the Go menu.
3. Type: /System/Library/CoreServices/Menu Extras/
4. Click Go.
5. Open the file "RemoteDesktop.menu".

The menu will appear on the right side of the menu bar, allowing the user to request attention.

This information is also found in the Remote Desktop Read Me.

Mac OS X 10.2: Compatibility With FAXstf X

FAXstf version 10.0.7 or later is required for use with Mac OS X 10.2.
This article has been archived and is no longer updated by Apple.

Symptom

You may encounter these issues:

- You are unable to send a fax after changing contact information in the Fax Browser preferences.
- The modem does not dial.
- You cannot fax reliably to earlier 9600 baud fax modems.
- FAXstf stops responding when sending documents with names that contain special characters.

Solution

The publisher of FAXstf, Smith Micro, provides a free update for all versions of FAXstf X. For more information about this update, see the Smith Micro Web site (http://www.smithmicro.com/default.tpl?group=product_full&sku=STFMACEE).

Mac OS X 10.2: Cannot Send Email

Some outgoing email (SMTP) servers will not accept mail from computers using NAT with a ".local." hostname, which may be assigned by Rendezvous.
This article has been archived and is no longer updated by Apple.

Symptom

Your Internet service provider will not accept outgoing email (SMTP) after upgrading to Mac OS X 10.2.

Note: The ".local." hostnames are assigned by Rendezvous. Client computers connected via NAT have IP addresses beginning in 10, 169, or 192. NAT connections may be provided by an AirPort Base Station, a third-party router, or Internet Sharing. It is also known as IP masquerading, or just connection sharing.

Solution

Update to Mac OS X 10.2.1. For more information, see technical document 107036, "**Mac OS X: About the Mac OS X 10.2.1 Update**".
Published Date: Feb 17, 2012

Mac OS X 10.2 (Japan): Internet Sharing via AirMac Does Not Work

Your Internet connection cannot be shared to AirMac-equipped computers if the network name contains Japanese double-byte characters.
This article has been archived and is no longer updated by Apple.

Symptom

- Internet Sharing will not start over AirMac.
- The AirPort network name does not appear at client computers.
- The AirMac menu bar item does not change to the Internet Sharing icon, which is an up arrow.

Note: AirMac is also known as AirPort in North America and other regions.

Solution

This occurs when the name of the AirMac network created at the sharing computer contains Japanese double-byte characters. To resolve the issue, follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Sharing from the View menu.
3. Click the Internet tab.
4. Click AirPort Options.
5. Change the Network Name to a single-byte name (Roman characters).
6. Click OK.

This document will be updated as more information becomes available.
Published Date: Oct 10, 2016

Mac OS X 10.2: Cannot Print to HP LaserJet 4V or 4MV

You may encounter a situation in which you are not able to print to a Hewlett Packard LaserJet 4V or 4MV printer.
This article has been archived and is no longer updated by Apple.

Symptom

An application unexpectedly quits when printing to an HP LaserJet 4V or LaserJet 4MV. A crash log may appear, the first two lines of which read:

Exception: EXC_BAD_ACCESS (0x0001)
Codes: KERN_PROTECTION_FAILURE (0x0002) at 0x00000000

Solution

Update to Mac OS X 10.2.8 or later.
Published Date: Feb 17, 2012

Mac OS X 10.2: Disk Utility Finds "Problems" on Burned Discs

If you use Disk Utility to verify CD-R or CD-RW discs burned in Mac OS X 10.2, it reports "problems" that it says need to be repaired.

This article has been archived and is no longer updated by Apple.

Symptom

Disk Utility reports "problems" on a burned disc. You may see these messages:

"Volume Bit Map needs minor repair"

"Invalid volume free block count (It should be 0 instead of -1)"

This does not affect DVD discs or other applications.

Solution

The condition reflected in these messages does not affect the use of the disc. You may safely ignore the messages. You cannot repair a burned disc. To avoid the message on future discs, update to Mac OS X 10.2.1. For more information, see technical document 107036, "**Mac OS X: About the Mac OS X 10.2.1 Update**".

Note: If the same messages appear in Disk Utility for writable media, such as the computer's hard disk, you should allow the repair.

Published Date: Oct 10, 2016

Mac OS X 10.2, 10.3: Clicking "Apply to enclosed items" copies permissions but not owner or group

When changing Ownership & Permissions in the Info window, clicking "Apply to enclosed items" copies only permissions. It does not affect the owner or group setting.
This article has been archived and is no longer updated by Apple.

Note: This document applies to Mac OS X 10.2 through 10.3.9.

Symptom

Your chosen Owner and Group settings are not copied to enclosed items after you click "Apply to enclosed items".

Solution

If you need to make such changes to many files, you can either:

- Change each item individually in the Finder's Info window (Command-I), or
- Use Terminal commands like `sudo chown -R` and `sudo chgrp -R` to make such changes.

If you need to correct the permissions on folders created by the Mac OS X Installer, click Repair Privileges in the First Aid pane of Disk Utility.

For example, to change ownership:

1. Open Terminal (/Applications/Utilities/)
2. In the Finder, open the window that contains the folder that you wish to modify, so that you can drag that folder into the Terminal window later
3. Type the following: `sudo chown -R username`

   Leave a space after the username, which is the shortname of the user that you'd like to own the items (for example, "smith"). Do not press Return yet.

4. Drag the folder you wish to change into the Terminal window--the path automatically appears in Terminal
5. Press Return
6. Enter your admin password when prompted
7. Quit Terminal when this is finished

For example, to change group:

1. Open Terminal (/Applications/Utilities/)
2. In the Finder, open the window that contains the folder that you wish to modify, so that you can drag that folder into the Terminal window later
3. Type the following: `sudo chgrp -R groupname`

   Leave a space after the "groupname", which is the shortname of the user that you'd like to own the items (for example, "smith"). Do not press Return yet.

4. Drag the folder you wish to change into the Terminal window--the path automatically appears in Terminal
5. Press Return
6. Enter your admin password when prompted
7. Quit Terminal when this is finished

Mac OS X: What is a Classic Application?

This document provides a simple definition of what constitutes a Classic application.
This article has been archived and is no longer updated by Apple.
A Classic application is one for which the original system requirements, normally printed on the application's packaging, include Mac OS 9 but not Mac OS X. The system requirements listed may be "System 7.6.1 to Mac OS 9," for example. These applications cannot be used natively in Mac OS X, which is to say they do not work in the absence of a Mac OS 9 installation and the Classic environment.

Mac OS X includes the Classic environment. It uses a copy of Mac OS 9 to make Classic applications work in Mac OS X. Both Mac OS 9 and Mac OS X must be installed on the computer. The Classic environment starts automatically when you open a Classic application.

Applications that list both Mac OS 9 and Mac OS X in their system requirements are often Carbon applications. Carbon is a type of application that may work natively in either Mac OS 9 or Mac OS X. Neither the Classic environment nor a Mac OS 9 installation is needed to use a Carbon application in Mac OS X.

Notes

1. Retail copies of Mac OS X 10.2 or later do not include Mac OS 9. See technical document 106966, "**Mac OS X 10.2: Classic Requires That You Already Have Mac OS 9**".

2. If you need a technically detailed definition of Classic or Carbon applications, see the Apple Developer Connection (http://developer.apple.com/).

Published Date: Feb 17, 2012

Mac OS X 10.2: Burned CDs Do Not Work in Microsoft Windows

CDs burned using Apple Disc Burner software and the Mac OS X 10.2 Finder do not work with some versions of the Microsoft Windows operating system. Mac OS X 10.2.1 resolves this issue.
This article has been archived and is no longer updated by Apple.

Symptom

If you burn a CD in the Finder, then try to use it on a Windows-compatible computer, one of the following occurs:

- The Windows-compatible computer cannot read the CD.
- Items at the root level of the CD can be read, but items nested within folders cannot be read.

Solution

Update to Mac OS X 10.2.1, which allows you to burn CDs that work with Windows. For more information, see technical document 107036, "**Mac OS X: About the Mac OS X 10.2.1 Update**".
Published Date: Feb 17, 2012

Mac OS X: About the Mac OS X 10.2.1 Update

This software updates Mac OS X 10.2 to version 10.2.1.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Users from the View menu. Select an Admin user and click Edit User. Click the Password tab. Change the password and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

Installation

There are two ways to update to from Mac OS X 10.2 to 10.2.1.

I. Automatic Software Update Installation

See technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

II. Standalone Installer

An installer is available from Apple Software Downloads (http://www.apple.com/swupdates/).

Enhancements Delivered with this update

Disc Burning Enhancements

- Allows CDs burned on a Mac to be read on Microsoft Windows.
- Addresses a potential failure when burning a disc using iTunes 3 and a high burn speed.
- Addresses an issue in which Disk Utility inaccurately reported "problems" when scanning a disc that was burned with iTunes or in the Finder.
- Adds support for various third-party disc burners, including: TDK VeloCD 241032FP and 241040F, MCE Technologies Lucid-24 24x10x24x Portable FireWire CDRW Drive, LaCie PocketCDRW 24x10x24 U&I, EZQuest Boa CDR/w 48x12x48 FireWire, Formac cdrw 40x10x40 and cdrw 48x10x40.

Digital Hub and Peripheral Device Enhancements

- Decreases the amount of time Final Cut Pro takes to open, and improves iMovie compatibility when a Sony DVMC-DA1 media converter is connected to the computer.
- Improves iMovie compatibility with Canopus ADVC-100 media converter.
- Improves compatibility with certain (SCSI-based) scanners.
- Improves compatibility of Image Capture with Epson DS (TWAIN).
- Improves results when scanning in grayscale or black-and-white with Image Capture and Epson UI.
- Enhances reliability when hot-swapping a FireWire-based camera on certain iMacs using Final Cut Pro.
- Addresses an issue in which a USB keyboard or mouse is not recognized or able to wake the computer after having been connected to or disconnected from an external USB hub while the computer is in sleep.

Networking and Mail Enhancements

- Addresses a situation in which certain Internet service providers (ISPs) may not accept outgoing email (SMTP) from computers using NAT and a ".local" hostname (which may be assigned by Rendezvous).
- Prevents IMAP messages from being lost when your Internet connection is interrupted during a transfer.
- Improves access to Mac OS X Server during heavy AFP load.
- Improves Mac OS X Server reliability when a Mac OS 9 client attempts a scheduled AFP connection.

- Resolves a potential issue in which Mail could fail to import mail messages from Eudora as expected.
- Addresses an issue in which you cannot browse the contents of an iDisk while a large file is being copied to it.
- Kerberos authenticator now allows keytabs to be disabled.

Printing Enhancements

- Addresses a situation in which Print Center would unexpectedly quit when using St. Claire Software's Default Folder X.
- Improves compatibility with HP LaserJet 4V and HP LaserJet 4MV printers (see **Note**).
- Reduces occurrences of a "busy; source EIO (ATALK)" alert message when printing using AppleTalk via CUPS.
- Addresses an issue when printing via CUPS in which the second queued print job would automatically start if the first print job was stopped.
- Addresses an "error -1" message in Print Center when adding a third-party USB printer.

Note: This enhancement alleviates certain alert or log messages, but you still need to download an additional file. See technical document 107029, "**Mac OS X 10.2: Cannot Print to HP LaserJet 4V or 4MV**".

Other Enhancements

- Reduces certain instances of Web page graphics taking longer than expected to appear.
- Improves compatibility with Microsoft Entourage.
- Reduces occurrence of a "ticking hard drive" sound that could be caused by IOAudio errors being written repeatedly to the system.log file.
- Addresses an issue in which Mac Help may not be available following an erase-installation.
- Improves compatibility of the Universal Access Zoom feature with some iBook computers.
- Addresses a situation in which no video may appear after waking certain iBook computers that are connected to an external display or presentation device.
- Addresses a situation in which a Classic application may fail to produce sound after waking from sleep.
- Addresses a situation in which AppleTalk may not be available in the Classic environment after waking from sleep.
- Addresses various potential kernel panic situations.

Published Date: Oct 10, 2016

Mac OS X 10.2: Upgrade installation requires Mac OS X 10.1 or later

This article has been archived and is no longer updated by Apple.

If you have Mac OS X version 10.0.4 or earlier installed, the hard disk must be erased prior to installing version 10.2 or later. The Installer offers an option to "Erase and Install."

Symptom

When you select a volume that contains Mac OS X 10.0 to 10.0.4 system software, an alert box with this message appears:

> "You cannot install Mac OS X on this computer without changing your install setting."

Solution

The version 10.2 "Mac OS X Install Disc" or "Mac OS X Upgrade Disc" cannot be used to upgrade Mac OS X versions 10.0 to 10.0.4. The Mac OS X 10.2 Installer can upgrade Mac OS 10.1 or later.

Choose "Erase and Install" in the Mac OS X 10.2 Installer.

Warning: Choosing Erase and Install will completely erase the contents of the chosen volume before installing Mac OS X 10.2 or later. Be sure to back up your files before continuing. To learn more, see Mac OS X: How to Back Up and Restore Your Files".
Published Date: Oct 10, 2016

Mac OS X Server: About the Mac OS X Server 10.2.1 Update

Mac OS X Server Update 10.2.1 addresses certain issues and updates system software.
This article has been archived and is no longer updated by Apple.
This software updates Mac OS X Server 10.2 to version 10.2.1. It improves reliability and usability for these features:

- IP networking
- Apple file services
- Windows file services
- Open Directory Password Server
- Workgroup Manager
- NetBoot
- Network Image Utility
- Macintosh Manager
- Apple Software Restore
- Print Server

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Users from the View menu. Select an Admin user and click Edit User. Click the Password tab. Change the password and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

Installation

There are several ways to update to from Mac OS X Server 10.2 to 10.2.1.

I. Automatic Software Update Installation

See technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

II. Standalone Installer

An installer is available from Apple Software Downloads (http://www.apple.com/swupdates/).

III. Remote installation using the Software Update command-line tool.

See technical document 107058, "**Xserve: How to Remotely Install Software Using the Software Update Command-Line Tool**".

Enhancements Delivered with this update

File Services

- Resolves an issue with the SMB mount command.

Password Server

- Allows Open Directory Password Server to be located on a secondary or standalone server.
- Improves Password Server database integrity.

Installation

- Works better with remote Installation on ports other than the built-in (en0).

Workgroup Manager

- Improvements in Workgroup Manager user creation <cancel> handling.

Open Directory

- Addresses an issue with Open Directory LDAP server, preventing automatic discovery of the directory using DHCP.

Network Image Utility

- Changing active NetBoot images in the Network Image Utility no longer requires you to restart.
- Resolves an issue in which the Network Image Utility creates images with incorrect permissions.

Networking and Mail Enhancements

- Addresses a situation in which certain Internet service providers (ISPs) may not accept outgoing email (SMTP) from computers using NAT and a ".local" hostname (which may be assigned by Rendezvous).
- Improves Mac OS X Server performance in heavy AFP client load situations.
- Improves Mac OS X Server reliability when a Mac OS 9 client attempts a scheduled AFP connection.

Printing Enhancements

- Improves compatibility with HP LaserJet 4V and HP LaserJet 4MV printers.
- Reduces occurrences of a potential "busy; source EIO (ATALK)" alert message when printing using AppleTalk via CUPS.
- Addresses an issue in with printing via CUPS in which the second queued print job would automatically start if the first print job was stopped.
- Includes various other CUPS printing-related enhancements.
- Fixed condition in Print Server which could lead to over utilization of CPU cycles.

Other Enhancements

- Addresses a potential issue in which a USB keyboard or mouse is not recognized nor able to wake the computer, if they are connected to or disconnected from an external USB hub, while the computer is in sleep.
- Addresses a potential issue in which Mac Help may not be available following an erase-installation.
- Addresses various potential kernel panic situations.

This update includes the other enhancements contained in the Mac OS X 10.2.1 (non-Server) update. For more information see, technical document 107036, "**Mac OS X: About the Mac OS X 10.2.1 Update**".
Published Date: Oct 10, 2016

Mac OS X 10.2: How to Change Ownership & Permissions Using the Finder

This document explains how to change item permissions in Mac OS X 10.2 or later. This is a step recommended as part of some other troubleshooting procedures.
This article has been archived and is no longer updated by Apple.
In Mac OS X 10.2 or later, the Finder allows you to easily change basic permissions settings on files and folders.

1. Select the item in the Finder.
2. Choose Get Info from the File menu.
3. Click the disclosure triangle for Ownership & Permissions.
4. Make note of the original ownership and permissions, in case you need to revert to the original settings later.
5. Change the ownership or permissions to what you want, or to what is specified the technical document that referred you to this procedure.
   Note: If you are the owner of the item, you can change its permissions and ownership immediately. If changes require an Admin user name or password, you will be prompted to enter them. If the Access and Others pop-up menus are dimmed (unavailable), you need to change ownership before you can change the access permissions.
6. If needed, click "Apply to enclosed items". This feature only applies permissions, not ownership changes. See technical document 107031, "**Mac OS X 10.2: Clicking 'Apply to enclosed items' Copies Permissions But Not Owner or Group**".
7. If you are making a temporary change to work around an issue, be sure to change it back later.

Note: More advanced control over permissions is only available using non-Apple utilities or the Terminal commands chown, chgrp and chmod. These should not be necessary for normal use of Mac OS X. The Finder cannot be used to change advanced permissions, such as setuid, setgid and sticky settings.

For more information, see article 106712 "**Mac OS X: Troubleshooting Permissions Issues**"
Published Date: Oct 10, 2016

Mac OS X 10.2: Blue or Gray Screen Appears After Installing Apple Display Software

The computer restarts to a blue or gray screen after installing Apple Display Software.
This article has been archived and is no longer updated by Apple.

Symptom

The computer restarts to a blue or gray screen after installing Apple Display Software.

Solution

Reinstall Mac OS X 10.2 to resolve the issue. Because the necessary software is already included with Mac OS X 10.2, you should not install Apple Display Software.

Note: It is not necessary perform an Erase Install or Archive and Install, unless you have updated to a later version of Mac OS X than the one included on your software installation CD.
Published Date: Oct 10, 2016

Mac OS X 10.2: Applications are missing after upgrade installation

This article has been archived and is no longer updated by Apple.

Certain applications may be removed and not reinstalled if the Additional Applications package is deselected during a custom installation of Mac OS X 10.2. Adobe Acrobat Reader may appear as a folder and may not open.

Symptom

- Certain additional applications, such as iTunes, iPhoto, or iMovie, are removed during installation.
- Adobe Acrobat Reader appears as a folder and will not open.

Solution

Do not deselect Additional Applications when installing Mac OS X 10.2. To reinstall missing software, either download and install the software (if applicable) or reinstall using the Mac OS X 10.2 Install CDs.

Note: Before reinstalling Adobe Acrobat Reader, delete the existing (unusable) Acrobat Reader folder.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Published Date: Oct 10, 2016

Mac OS X 10.2: Does Not Start Up After Third-Party Software Installation

After installing third-party software and restarting, a kernel panic message appears, or the computer does not start up as expected.
This article has been archived and is no longer updated by Apple.

Symptom

After installing third-party software that installs a kernel extension (.kext) file and restarting, a kernel panic message appears, or the computer does not start up as expected. This may include a text message such as "kernel exception" or "you need to restart your computer." For additional help identifying a kernel panic, see technical document 106227, "**Mac OS X: What is a Kernel Panic?**"

Solution

1. Press and hold the Shift key as the computer starts up, until "Safe Boot" appears. If this does not permit the computer to start up, a different issue exists. Refer instead to technical document 106464, "**Mac OS X: Troubleshooting a Startup Issue**".

2. Use the third-party software's original installer to remove the recently-installed software, if feasible. Contact the third party for assistance if needed. Alternatively, try Step 3.

3. If you are uncertain about which software was installed last, open these in List view and sort by Date Modified:

/Library/StartupItems/
/System/Library/Extensions/

Temporarily remove any relevant, recently-modified, third-party .kext files and restart the computer. For compatibility information, contact the manufacturer of any third-party software items which seem to cause this issue.

Note: Apple software installers do not place items in /Library/Startuptems/.
Published Date: Oct 10, 2016

Mac OS X Server: "Error -35" in Server Admin When Changing Sharing Attributes

If a remote server volume has been ejected ("unmounted") from the Finder, then Server Admin displays a "disk error" message when you select it for modification of sharing attributes.
This article has been archived and is no longer updated by Apple.

Symptom

When you select a disk or share point for modification of sharing attributes, you see an alert box with this message:

> " A disk error has occurred. Use a disk repair program to verify your disk. -35"

Solution

This occurs when Server Admin is used remotely, and when you have ejected the remote server volume from the computer at which you are working. Follow these steps to resolve the issue:

1. Quit Server Admin.
2. Reopen Server Admin, and reconnect to the server.

The remote volumes appear when you connect. Refrain from ejecting them until you are finished using Server Admin.
Published Date: Feb 17, 2012

Mac OS X Server: Multiple MTAs Cannot Share TCP Port 25

Only one mail transfer agent (MTA) can use TCP port 25 at any given time.
This article has been archived and is no longer updated by Apple.

Symptom

When you start Apple Mail Service on port 25, you see an alert that says that the port is already in use by another application (such as sendmail).

Solution

1. Quit your current MTA so that it will release the port.
2. In Server Admin, click the Internet tab.
3. Choose Configure Mail Service from the Mail Service module.
4. Click the Protocols tab.
5. Choose SMTP from the "Use... for message transfer" pop-up menu.
6. Click Save.

Note: Be sure that your alternate MTA is not configured to restart automatically, such as when you restart the computer.
Published Date: Feb 17, 2012

Mac OS X: "File Create Error" With HP ScanJet USB Scanner

You are not able to scan with a Hewlett Packard ScanJet scanner, and you see an alert box with a message that contains "file create error."
This article has been archived and is no longer updated by Apple.

Symptom

When you try to scan, you see an alert box with this message:

> "Sorry, an error has occurred saving to the file (File create error.)"

Note: This affects drivers that are installed in the Classic System Folder, and thus the symptom occurs when you are scanning in Classic applications.

Solution

Rebuild the Desktop file for the Classic System Folder. Follow these steps:

1. Choose System Preferences from the Apple Menu
2. Click the Classic icon .
3. Click the Advanced tab.
4. Click Rebuild Desktop.

Published Date: Feb 17, 2012

Mac OS X: Difficulty Using WebDAV Server

You may lack write access, such as creating new files and folders, if your WebDAV server is using Apache 2.
This article has been archived and is no longer updated by Apple.

Symptom

When using WebDAV, you can connect and browse content, but you cannot create new files or folders.

Solution

This occurs when the WebDAV server is using some versions of the Apache 2 Web server. Users of Mac OS 10.0 to 10.1.5 must update to Mac OS X 10.2 or later. Additionally, a configuration change may be required for the server. Refer your server administrator or Internet service provider to this document.

The following directive can be added to the httpd.conf file on the Apache 2 server to fix this issue:

```
BrowserMatch "^WebDAVFS/1.[012]" redirect-carefully
```

The httpd.conf file should already contain several BrowserMatch directives for other WebDAV clients. If there is not a BrowserMatch directive for WebDAVFS, then it should be added.

Note: Apache 2, as installed with Mac OS X Server 10.2, includes this directive, but the default installation of Apache 2 may not.

Mac OS X Server: Multiple Versions of Tomcat Installed

If you have updated to Mac OS X Server 10.2 from a previous version, multiple versions of Tomcat may be present.
This article has been archived and is no longer updated by Apple.

Symptom

You find different versions of Tomcat installed at these locations:

- /usr/local/tomcat
- /Library/Tomcat

This may lead to confusion over which executable file to use.

Solution

To avoid accidentally using the wrong version of Tomcat, you may wish to delete the old version. You must be logged in as an Admin user. Follow these steps:

1. Open Terminal (/Applications/Utilities/). See Warning, below.
2. Type: `sudo rm -rf /usr/local/tomcat`
3. Press Return.
4. Type your Admin password when prompted, then press Return.
5. Quit Terminal.

Warning: Misuse of the "rm -rf" command can result in data loss. Be sure to type the line exactly. You can even copy and paste the text into Terminal. Web browser settings can affect the appearance of text. You can paste the text into a text editor to ensure that you see the correct spacing.

Mac OS X 10.2 Address Book: How to Import Contacts from Entourage

You can easily import contacts from Microsoft Entourage using vCard format.
This article has been archived and is no longer updated by Apple.
To import contacts from Entourage:

1. Create a new folder in the Finder on your desktop named "Contacts".
2. Open the address book in Entourage.
3. Select the contacts you want to export. If you want to export all of them, choose Select All from the Edit menu.
4. Drag the selected contacts into the Contacts folder that you created. This creates vCard files for each of the contacts you selected.
5. Quit Entourage.
6. Open the Address Book application.
7. Choose View Card and Columns from the View menu.
8. Drag the Contacts folder from the desktop to the Groups column of the Address Book window.

The contact information should now be available in Address Book.

Notes:

1. As an alternative method, you may use AppleScript. See technical document 106996, "**Mac OS X 10.2: About Import Addresses and Other Mail Scripts**".

2. For iPod users: If your iPod is in FireWire disk mode, you may also drag vCard files to and from the Contacts folder on iPod.

3. For information about importing addresses from Microsoft Outlook Express, Eudora, Claris Emailer, Netscape, or Palm Desktop, see technical document 106996, "**Mac OS X 10.2: About Import Addresses and Other Mail Scripts**".

Published Date: Feb 17, 2012

Mac OS X 10.2: Difficulty Using Hewlett Packard Printers

Hewlett Packard has released updated (2.0 or later) printer drivers that resolve certain issues you may encounter when using the versions 1.4.1 HP drivers that were included with Mac OS X 10.2 (build 6C115).
This article has been archived and is no longer updated by Apple.

Symptom

Various issues when using an HP printer.

Note: Users of the 1220c series should see technical document 107208, "**Mac OS X 10.2: Cannot Print After Installing Deskjet 2.0 Drivers**".

Solution

Download and install the latest drivers for Mac OS X from the Hewlett Packard Web site (http://www.hp.com/).

HP 2.0 or later drivers address these issues:

- faster printing from all modes (benefits primarily Mac OS X 10.2)
- more stable printer communication
- ability to save more than 1 preset (Mac OS X 10.2 only)
- digital photography options (applicable printers only)
- 2400 by 1200 and 4800 by 1200-enhanced printing (applicable printers only)

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.2: iSub Volume Muted After Installation

The volume of an iSub speaker is set all the way down (muted) after installing Mac OS X 10.2.
This article has been archived and is no longer updated by Apple.

Symptom

No sound comes from the iSub speaker.

Solution

Set the iSub volume to the desired level. Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Sound from the View menu.
3. Click the Output tab.
4. Set the iSub volume slider to the desired level.

Published Date: Feb 17, 2012

Mac OS X 10.2: Pressing the Mute Key Does Not Mute iSub

When using Mac OS X 10.2, pressing the Mute key does not mute iSub.
This article has been archived and is no longer updated by Apple.

Symptom

iSub continues to make sound after you press the Mute key.

Solution

Use the Sound preference pane to mute iSub.

1. Choose System Preferences from the Apple menu.
2. Choose Sound from the View menu.
3. Click the Output tab.
4. Select the checkbox for Mute next to the iSub volume slider.

Published Date: Feb 17, 2012

Mac OS X: "You need to restart your computer" Alert Appears

In Mac OS X 10.2 or later, the older style kernel panic message is replaced with an alert that says you need to restart your computer.
This article has been archived and is no longer updated by Apple.

Symptom

You see this alert message:

> "You need to restart your computer. Hold down the Power button for several seconds or press the Restart button."

Figure 1 A kernel panic in Mac OS X 10.2 or later

Solution

This message indicates that a kernel panic has likely occurred. To learn more, see technical document 106227, "**Mac OS X: What Is a Kernel Panic?**"
Published Date: Oct 10, 2016

Mac OS X Server 10.2: "You can‘t connect to this server" Alert When Opening Server Admin

Server Admin cannot administer a version 10.2 or later server, but it can be opened on one for purpose of controlling a remote server with which it is compatible (versions 10.0.3 to 10.1.5).
This article has been archived and is no longer updated by Apple.

Symptom

When you open Server Admin at a Mac OS X Server 10.2 or later computer, an alert box with this message appears:

> "You can't connect to this server with this version of Server Admin. You must first install the version of Server Admin that came with the server to which you want to connect."

Solution

Mac OS X Server 10.2 replaces Server Admin (used in versions 10.0.3 to 10.1.5) with a new set of administration applications. Server Admin is not installed with Mac OS X Server 10.2 or later. It may be present if the server was upgraded from a previous version, or you can copy it manually to the server.

Though the alert appears, you can still use Server Admin from a version 10.2 server to control a remote server that is version 10.0 to 10.1.5. Server Admin cannot control the version 10.2 server on which it resides.

Note: Server Admin cannot be used to add users to groups on a 10.0.3 to 10.1.5 Server when used from a 10.2 computer (server or client). You may, however, change a user's primary group ID.
Published Date: Feb 17, 2012

Mac OS X 10.2: Difficulty Using PDF in Preview

You may have difficulty when using a password-protected PDF document in Preview. A permissions pane may appear when the PDF is opened. This article has been archived and is no longer updated by Apple.

Symptom

A permissions sheet may appear when you open a PDF document. It may not clearly specify what actions are available to you. You may not be able to view, print, or copy items from the document.

Solution

This is expected behavior if the author of the PDF file has password protected it. You must have the password to get full access to the document. Contact the person who created the document for assistance, when possible or necessary.

Published Date: Feb 17, 2012

AppleScript 1.9: Paste Reference Command in Script Editor is Dimmed

In Mac OS X 10.2 through Mac OS X 10.2.8, the Paste Reference menu command is always dimmed (unavailable) in Script Editor version 1.9.

This article has been archived and is no longer updated by Apple.

Symptom

The Paste Reference menu command is dimmed in Script Editor.

Solution

As a workaround, you can manually type the path to the file.

Published Date: Feb 17, 2012

Mac OS X: Computer Does Not Go to Sleep After Disconnecting External Hard Drive

After you disconnect a FireWire or USB hard drive, the computer does not automatically go to sleep when idle (inactive).
This article has been archived and is no longer updated by Apple.

Symptom

The computer does not automatically go to sleep from lack of activity, when idle.

Solution

Update to Mac OS X 10.2.4 or later for improved results.
Published Date: Feb 17, 2012

Mac OS X: Installer Package Appears as a Folder

This document explains what to do if an installer (or other package) appears as a folder and thus cannot be used as expected.
This article has been archived and is no longer updated by Apple.

Symptom

- An installer icon appears as a folder instead of a normal package icon, and it is not usable.
- When trying to use package that appears as a folder, it opens to show contents (instead of opening the Installer application).

Solution

1. Verify that the Installer application is installed in this folder:

/Applications/Utilities

If Installer is not present, you may restore it by copying it from your Mac OS X Install CD. On the CD, it is located at:

Mac OS X Install CD/Applications/Utilities/Installer

If Installer is present but the issue persists, continue to Step 2.

2. Remove these files, then restart the computer:

For Mac OS X 10.2 or later, remove:

/Library/Caches/com.apple.LaunchServices.LocalCache.csstore
~/Library/Caches/com.apple.LaunchServices.UserCache.csstore
~/Library/Preferences/com.apple.LaunchServices.plist

For Mac OS X 10.1 or earlier, remove:

~/Library/PreferencesLSApplications
~/Library/PreferencesLSClaimedTypes
~/Library/PreferencesLSSchemes

Note: The tilde (~) character represents your Home folder.

3. If the issue persists, create a new Admin user account in System Preferences.

Note: For Mac OS X 10.0 to 10.1.5, the User preference pane is used. In Mac OS X 10.2 or later, you use the Accounts preference pane.

4. Log out, and log back in as the Admin user you just created.

5. Mac OS X 10.1.5 only: If the issue persists, use the Repair Privileges utility. See technical document 106900, "**Mac OS X: About the Repair Privileges Utility 1.1**".

6. If the issue persists, you may need perform an erase-install (Mac OS X 10.0-10.1.5) or Archive Installation (Mac OS X 10.2) to resolve the issue.

Published Date: Oct 10, 2016

Mac OS X 10.2: IMAP Mailbox Folders Do Not Appear

When using the application Mail, you may encounter a situation in which new IMAP mailboxes do not appear.
This article has been archived and is no longer updated by Apple.

Symptom

Mail does not display new mailbox folders that you added to an IMAP account. However, the mailbox folders appear as an option in the Transfer submenu of the Message menu.

Solution

You may resolve this by creating an additional, dummy account.

1. Choose Preferences from the Mail menu.
2. Click Accounts, if necessary.
3. Click Add Account.
4. Configure the account with dummy (bogus, fake) information. It does not matter if the account is POP or IMAP.

   Note: You should deselect the Advanced tab option "Include when automatically checking for new mail".

5. Click OK.
6. Close the Mail Preferences window.
7. Try creating new mailbox folders. If they do not appear, then quit and reopen Mail.

Figure 1 shows how this might look. Click the disclosure triangle to the left of the account name (or location) to see subfolders.

Figure 1 Mailbox folders

Mac OS X 10.2: Mac Help Is Slow, Displays Spinning Disc Pointer

Mac Help may be unresponsive for a few seconds, displaying the spinning disc pointer, and the message "Retrieving... ". Mac Help then returns to normal use.
This article has been archived and is no longer updated by Apple.

Symptom

After opening Mac Help, a spinning disc pointer and the status message "Retrieving..." appear for several seconds.

Solution

Wait until Mac Help has finished downloading online content. If Mac OS X 10.2 was recently installed, this may require several seconds and more than one use of Mac Help. Mac Help will open more quickly in the future, after content has been downloaded .

If Mac Help continues to be slow, you may try this workaround: Create a new network location, which you may name "Mac Help" for easy reference. In this location, turn off all port configurations that are not for the primary, in-use Internet connection. If you need help doing this, see technical document 106653, "**Mac OS X: How to Use Locations**".

Example: If the computer is connected via Built-in Ethernet to a DSL or cable modem, then you would disable AirPort, IrDA, USB Bluetooth Modem Adaptor, and Modem port configurations in the new location that you create (AirPort, USB Bluetooth Modem Adaptor, and IrDA appear only on computers that contain that hardware).

After using Mac Help successfully, you should try switching back to your original location.

Mac OS X 10.2: Screen Capture (Screen Shot) Enhancements

Mac OS X 10.2 introduces features for taking screen captures, also known as screens shots.
This article has been archived and is no longer updated by Apple.
As in earlier versions of Mac OS X, the Command-Shift-4 key combination allows you to capture a selection of your screen using a cross-hair mouse pointer. To cancel the capture, press the Esc key.

Additional features for version 10.2 include:

- Press the Space bar to switch between cross-hair selection and Window capture modes.
- Control-click to capture to the clipboard instead of to a file.

Published Date: Feb 17, 2012

Mac OS X 10.2: Kernel Extension (kext) Files May Generate Security Warning

Some third-party kernel extensions (files that have a ".kext" filename extension) may generate a security warning during startup.
This article has been archived and is no longer updated by Apple.

Symptom

During startup, a dialog box appears with this message:

> "The program you are using needs to use a system file that may reduce the security of your computer."

The dialog offers choices of Fix and Use, Use, and Don't Use (Figure 1).

Figure 1 The .kext security warning dialog

Solution

Mac OS X 10.2 and later has stricter security checking of kernel extensions. These files should have permissions that restrict any user other than the system software (the "root" user) from making changes to the file. If a kernel extension has less restrictive privileges, it will trigger this alert.

If you are confident that the kernel extension is the correct, unaltered file, you may click Use to use the file with the existing permissions. Alternatively, click Fix and Use to correct the permissions and use the file.

If you are not confident about the nature of the kernel extension, click Don't Use.

Note: if you select Don't Use, applications and devices that rely on this kernel extension may not function as expected.

In any case, you should contact the vendor of the kernel extension to get a new version that conforms to the expected permissions.

Read before restoring your computer‘s software (Mac OS X 10.2 through 10.3.1)

This article has been archived and is no longer updated by Apple.

This document is a reproduction of the "Read Before Restoring Your Computer's Software" that is included with computers that ship with Mac OS X 10.2 through 10.3.1.

Read Before Restoring Your Computer's Software

Restoring Your Computer's Software
Software Restore restores your computer's original contents except Mac OS X. This includes the Mac OS 9 system software and the applications that came with your computer.

Software Restore does not restore Mac OS X, iPhoto, iTunes, iChat, or iMovie. If you need to reinstall Mac OS X or these applications, use the Mac OS X installation discs that came with your computer. First back up essential software and files, if possible.

After reinstalling Mac OS X, if you need to restore the rest of your computer's applications and files, double-click Software Restore.pkg. This will install the Software Restore application into the Utilities folder, inside the Applications folder on your hard disk. When the installation is complete, Software Restore opens.

To restore your computer's original contents:
1. Make sure you are using Mac OS X v10.2. If you are using Mac OS 9, restart your computer in Mac OS X. To do this, open the Startup Disk control panel, select Mac OS X and click Restart. You can not start your computer from the Software Restore CDs.
2. Make sure you have all the Software Restore CDs that came with your computer.
3. Double-click Software Restore.pkg.
4. Follow the onscreen instructions.
5. When prompted, select the applications and files you want to restore.

For more information about Mac OS X, select Mac Help from the Help menu, or go to www.apple.com/support

Mac OS X 10.2: Mail Messages Lost If Network Connection Interrupted During Transfer

If your network (or Internet) connection is lost while email is transferred to your computer, all mail not transferred is lost. Update your software to avoid this issue.
This article has been archived and is no longer updated by Apple.

Symptom

Mail being transferred is lost if your network connection is interrupted.

Solution

Update to Mac OS X 10.2.1. For more information, see technical document 107036, "**Mac OS X: About the Mac OS X 10.2.1 Update**".

Warning: Even under normal circumstances, transferring messages to a remote IMAP account is an example of an action that results in deletion of the original file as it is placed elsewhere. Generally speaking, copying a file to another computer does not delete the original file. It is important to remember that IMAP can be an exception to the general rule. Any time that you take this, or similar action, you should back up the original files first. For an example scenario, see technical document 106778, "**Mac OS X Mail: How to Import Email From a Non-Macintosh Computer**".
Published Date: Oct 10, 2016

Mac OS X 10.2: Mail Messages Moved to "On My Mac" Mailbox

If you upgrade to Mac OS X 10.2 from an earlier version, previous email messages are moved to the On My Mac mailbox.
This article has been archived and is no longer updated by Apple.

Symptom

Mail moves existing email messages to an "On My Mac" mailbox.

Solution

1. Click the "On My Mac" Mailbox so that you can see the mailbox contents in the message list.
2. Select the mail in the message list that you want to move to your Inbox.
3. Drag the selected mail to your new Inbox.

Published Date: Oct 10, 2016

AppleWorks 6: Word Processing Documents Do Not Print When Multiple Documents Are Open

If you already have a document open and then open a word processing document, you will not be able to print the word processing document. This document explains the workaround.

This article has been archived and is no longer updated by Apple.

Symptom

After clicking Print in the Print dialog, the document does not print.

Solution

This occurs specifically when you have an AppleWorks document (or multiple documents) already open and then choose Open from the File menu in AppleWorks to open another existing word processing file.

To be able to print the word processing document:

1. Click once anywhere outside of the document window.
2. Click once on the document you would like to print.
3. Choose Print from the File menu.

Published Date: Feb 17, 2012

Mac OS X Server 10.2, 10.3: How to reshare NFS exports via AFP

This article has been archived and is no longer updated by Apple.

To reshare an NFS mount as an AFP share point:

1. From the NFS server, export the directories you want to reshare to the Mac OS X server. Since AFP runs as root, the NFS export must map root-to-root so that AFP will be able to access the files for the clients. Restrict the export to the single AFP server (seen as a client to the NFS server). As NFS is not a secure connection, this can be made even more secure by having a private network for the connection from the NFS Server to the AFP Server.

Note: If you do not map root-to-root when attempting to save privileges in WorkGroup Manager you will see an "Unable to save changes" message when trying to share the item.

2. On the AFP server, create a folder in the root level of the startup disk named "nfs_reshares". Mount any exports that you wish to share as folders inside this folder. For information about mounting nfs exports, see the manual page for the mount command by executing "man mount" in Terminal. The advanced section below describes a method for automatically mounting NFS exports.

3. Use the Sharing module in Workgroup Manager to share the NFS mounts as AFP share points. The NFS mounts appear as normal volumes in the All list. (Though it is also possible to share the NFS mounts using SMB and FTP, only AFP has been fully tested and qualified.) You can change privileges and ownership but cannot enable quotas (quotas work only on local volumes). However, if quotas are enabled on the NFS server, they should apply to the reshared volume as well.

4. Stop the File Server and restart it. The export should be available.

Many users will wish to have exports appear automatically on when they restart their computers. There are third-party utilities that are available to configure this, or you can follow the instructions below to manually edit NetInfo

Advanced

You can set up the server to mount exports at startup by manually editing NetInfo's /mounts property.

Be sure to edit the local NetInfo database. Setting these properties and values as such:

```
property   -   value
vfstype        nfs
dir            /nfs_reshares/mountpoint
name           server:/full/path/to/exported_directory
opts           <any mount options>
```

To do this follow these steps:

1. Open NetInfo Manager (/Applications/Utilities).
2. Click the lock button in the lower left corner.
3. Select the mounts item in the center column.
4. Choose New Subdirectory from the Directory menu.
5. In the new property enter 'vfstype' for the property, and 'nfs' for the value.
6. Choose New Property from the Directory menu.
7. In the new property enter 'dir' for the property, and the path to your mount, which will be a folder in "/nfs_reshares/".
8. Choose New Property from the Directory menu.
9. In the new property enter 'name' for the property, and the server and path in this format:
server:/full/path/to/exported_directory
10. Choose New Property from the Directory menu.
11. In the new property enter 'opts' for the property, and enter any options you want for the mount. "-s" will allow for a soft mount, and so forth. If you are unfamiliar with mount options, see the man page by typing 'man mount' in Terminal.

Note: The NFS exports should be available after the server is restarted. Setting up NFS exports to automatically mount is not covered by AppleCare's free technical support.

Mac OS X 10.2: Screen Shots Are Saved in PDF, May Be Converted

Mac OS X 10.2 saves screen shots in PDF format, which you may convert to another format.
This article has been archived and is no longer updated by Apple.
Screen shots are saved on the desktop as PDF files. If desired, you may convert a screen shot file from PDF to a different format by following these steps:

1. Open the screen shot file that you want to convert (see Note).
2. Choose Export from the File menu. A save dialog sheet appears.
3. In the save dialog sheet, choose a different format from the Format pop-up menu.
4. Change the name of the file and/or the save destination if desired.
5. Click Save.

Note: These directions pertain to the Preview application, which is the default for opening PDF files. You may use other applications, but the steps would differ.
Published Date: Oct 10, 2016

Mac OS X: Importing addresses from Previous Address Book after upgrade or Archive and Install

This article has been archived and is no longer updated by Apple.

When upgrading *from* Mac OS X 10.1 to Mac OS X 10.2, or Mac OS X 10.1 or 10.2 *to* Mac OS X 10.3 Panther, Address Book automatically retains previous entries but not the "temporary" addresses used by Mail. Learn how to import those temporary addresses.

Note: This document applies to Mac OS X 10.1 through 10.3.9.

When you upgrade from Mac OS X 10.1 to Mac OS X 10.2 or later, all your Address Book entries are preserved. The first time that you open Mail, Address Book, or iChat, these addresses will be imported automatically into the Mac OS X 10.2 Address Book.

Tip: This section applies if you installed a later version of Mac OS X over an earlier one on the same volume, without erasing, and without performing an Archive and Install installation. If you performed an Archive and Install installation or different-volume installation, see "Archive and Install or installation on different volume" below.

In Mac OS X 10.1, Mail also kept a list of "temporary" addresses that were used in Mail but that were not explicitly added to the Address Book application. These addresses are not automatically imported into a later Address Book, but are imported as part of the Mail Address History (or Previous Recipients). To add them to the Address Book, follow these steps:

1. Open Mail.
2. Choose Address History (Mac OS X 10.2.8 or earlier) or Previous Recipients (Mac OS X 10.3 or later) from the Window menu.
3. Select as many entries as you wish to import. You can use the Command or Shift key while clicking to select multiple entries.
4. Click Add to Address Book.

Archive and Install or installation on different volume (partition)

If you choose to "Archive and Install" the later version over the earlier one, or installed the later version on a different volume or partition, your previous addresses will not be automatically imported. To import them, follow the steps below. You can also follow these steps if for any reason you wish to re-import your previous addresses.

1. Be sure that Mail, Address Book, and iChat are quit.
2. If you have **not** used these three applications since upgrading, skip to Step 9. If you have used them since upgrading, you will need to remove certain Address Book data before importing your previous addresses (Steps 3 to 8).
3. Click the Finder icon in the Dock.
4. Choose Go to Folder from the Go menu.
5. Type: `~/Library/Application Support/`
6. Click Go.
7. Here, locate the folder named "AddressBook".
8. Drag the AddressBook folder to the Trash, or if you prefer, drag it to a backup location.
9. Copy the "Addresses" folder from the Library folder of your previous Home directory to the Library folder of your current Home directory. For reference, the pathname of your previous Address folder would be:

   `/Previous Systems/Previous System 1/Users/`{your username}`/Library/Addresses`

   The folder to copy it to would be:

   `/Users/`{your username}`/Library/`

10. Rename the "Addresses" folder you copied to "AddressBook".
11. Open Mail, Address Book or iChat. Your previous addresses will be imported automatically.

Mac OS X 10.2: How to Make AppleTalk Active or Inactive in the Classic Environment

In Mac OS X 10.2 or later, Classic AppleTalk status is always that of Mac OS X. Use the System Preferences application to enable or disable AppleTalk.

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.2 or later, the status of AppleTalk in Classic is always the same as the status of AppleTalk in Mac OS X. Use the Mac OS X Network preference pane to adjust AppleTalk status.

In contrast to prior versions of Mac OS X, you cannot use the AppleTalk control panel in the Classic Environment. Additionally, you cannot use the Chooser or AppleScript to change AppleTalk status.

Follow these steps:

1. Open System Preferences.
2. Choose Network from the View menu.
3. Click the AppleTalk tab.
4. Select or deselect the checkbox for Make AppleTalk Active, as desired.
5. Click Apply Now.

Mac OS X 10.2: Kotoeri Keyboard Shortcuts Have Changed

After installing Mac OS X 10.2, the Control-1 and Control-2 keyboard shortcuts used for the Kotoeri input method may be reversed. They are used for the Similar-Kanji-Finding command and the Related-Characters command.
This article has been archived and is no longer updated by Apple.

Symptom

- You get the Similar-Kanji-Finding command when you expect the Related-Characters command, or vice versa.
- The Control-1 and Control-2 keyboard shortcuts are reversed from their normal position in the Kotoeri Pencil Menu.

Solution

You may return the shortcuts to the commands you want by following these steps:

1. Choose Kotoeri Preference from the Kotoeri Pencil Menu.
2. Click the Convert tab.
3. Change the order of the Convert dictionaries.

Mac OS X 10.2: Print Center Unexpectedly Quits When Default Folder X Is Installed

Print Center quits unexpectedly if you are using the shareware application Default Folder X.
This article has been archived and is no longer updated by Apple.

Symptom

When adding a printer to the Printer List, you see an alert box with this message:

> "The application Print Center has unexpectedly quit. The system and other applications have not been affected. OK"

Solution

St. Clair Software has released updates to address this and other issues. Download and install the latest version of Default Folder (http://www.defaultfolder.com/). This is also addressed in the Mac OS X 10.2.1 Update. See technical document 107036, "**Mac OS X: About the Mac OS X 10.2.1 Update**".

Mac OS X: "No file services are available" Alert When Logging in to Windows File Sharing

When logging in to a shared Microsoft Windows computer from Mac OS X, your password is case-sensitive and must be typed properly.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to log in to a Windows-compatible computer from a Mac OS X computer, an alert box with this message appears:

> "No file services are available at the URL smb://computername/share."

Solution

Be sure to type your password with correct lowercase and capital letters. If necessary, ask the owner of the shared computer to reset your password.

Windows File Sharing will not start, stay on, or allow workgroup name change in Mac OS X 10.2

If you deselect the installation of the BSD Subsystem, Windows File Sharing will not work as expected. Windows File Sharing will not start or stay on, and you cannot change your workgroup name (which may prevent sharing).
This article has been archived and is no longer updated by Apple.
Reinstall Mac OS X with the BSD Subsystem.

The BSD Subsystem is installed by default as a part of Mac OS X. You must have intentionally deselected it to experience this issue for this reason. If you did a standard (non-custom) installation, then you should troubleshoot further and search the Knowledge Base for other related issues. You should also make sure that your network connection is still active, since a lack of network connection may also prevent Windows File Sharing from working.

Mac OS X 10.2: Contents of Windows (SMB) Volumes Not Automatically Refreshed in Finder

The Mac OS X 10.2 Finder does not automatically refresh the contents (directory listing) of Windows shared volumes when files are added to them at the Windows computer that is sharing.
This article has been archived and is no longer updated by Apple.

Symptom

At the Windows computer that is sharing, files are added to a Windows shared volume; but they do not appear there in the Mac OS X Finder. (The directory listing is not refreshed).

Solution

To see an updated view of the shared SMB volume:

- Using the Mac OS X 10.2 Finder, create a new folder or copy a file to the directory you wish to refresh, **or**
- Eject (unmount) the shared SMB volume and reconnect to it.

Published Date: Oct 10, 2016

Mac OS X: Short Name can be longer than Name

In Mac OS X 10.2 or later, a user's "short name" may be longer than the user's "name." This is normal.
This article has been archived and is no longer updated by Apple.
The Name field is where you may type your name as you desire, with capital letters and spaces. But for system-level tasks, Mac OS X also requires a version of your name that does not contain capital letters or spaces. This is referred to as the "short name" and is entered in the Short Name field. The term "short name" should not be taken literally.

The short name is limited to eight characters in Mac OS X versions 10.0 through 10.1.5. With Mac OS X 10.2 or later, it may be up to 255 characters long.
Published Date: Feb 17, 2012

Mac OS X 10.2: Internet Connect Uses CHAP and PPTP for VPN

The Virtual Private Network (VPN) feature of Internet Connect uses Challenge-Handshake Authentication Protocol (CHAP) and Point-to-Point Tunneling Protocol (PPTP). It does not use PAP or IPSec.
This article has been archived and is no longer updated by Apple.

Symptom

If you use Internet Connect VPN to connect to a server configured for PAP, this message appears in the Internet Connect Log:

> "CHAP authentication failed."

Solution

Mac OS X 10.2 Internet Connect VPN uses CHAP to authenticate users with remote Point-to-Point Protocol (PPP) servers. Internet Connect VPN works with MS-CHAP v2 (MPPE-40/128 bit RC4 encryption). Internet Connect VPN does not use PAP.

Internet Connect VPN uses PPTP (Point-to-Point Tunneling Protocol) to provide secure connections with remote networks. Internet Connect VPN does not use IPSec.

Mac OS X: Script Editor Has Two Choices for Saving Compiled Script

When using Script Editor to save a new file, there are two choices for compiled script.
This article has been archived and is no longer updated by Apple.

Symptom

When you choose Save As or save a script for the first time, you see two choices for the format:

- compiled script
- Compiled Script

Solution

The choices produce identical scripts. It does not matter which format you choose; they only differ in the capitalization. This is to expected to be corrected in a future version of Script Editor.

Mac OS X 10.2: "Internet Config. Extension error -677" Alert in Classic

You cannot create or duplicate sets in the Internet control panel. If you try, you see an alert box.
This article has been archived and is no longer updated by Apple.

Symptom

The Internet control panel (available when Classic is running) lists only one set named "Mac OS X". If you try to duplicate the set, or create a new one, an alert box with this message appears:

> "Internet Config. Extension error -677 has occurred! Unable to continue."

The Internet control panel then quits without saving any changes.

Solution

The Mac OS X System Preferences application includes an Internet pane that allows you to make settings for accessing the Internet. The Internet control panel performs the same function. Settings made in System Preferences affect the behavior of Classic Internet applications.

Changes made to the Mac OS X set in the Internet control are effective for all of Mac OS X. However, you should use the Internet pane of System Preferences to change most settings. Some Internet control panel settings have no counterpart in the Internet pane of System Preferences, including those found in the News and Advanced tabs of the Internet control panel. You should use these tabs in the Internet control panel if necessary.

Mac OS X 10.2: Dock and Desktop Icons Out of Position After Quitting Full-Screen Game

After quitting a game that uses the full screen, the Dock and icons on the desktop may be drawn out of position.
This article has been archived and is no longer updated by Apple.

Symptom

Many games use the full computer screen, changing the resolution and color depth during play. After quitting such a game, the monitor returns to the original resolution and color depth settings. In some cases, the Dock and icons on the Desktop may be positioned incorrectly.

Solution

Re-select the proper resolution and color depth settings in the Displays pane of System Preferences, or the Displays menu bar item (if active).

Mac OS X 10.2: "Error =-50" When Connecting to a Windows-Compatible Computer

You may see an "error =-50" alert message when attempting to connect to a Microsoft Windows-compatible computer (PC). This document explains what to do.
This article has been archived and is no longer updated by Apple.

Symptom

When using the Connect to Server dialog, you see an alert box with this message:

> "An error has occurred (error=-50)"

Products affected

- Mac OS X 10.2 or later

Solution

This may indicate that the Windows-compatible computer is not correctly sharing the disk on the network. Follow these steps to resolve the issue on the Windows computer:

Windows 95, 98, or Me

1. Right-click the disk that is to be shared, and select Properties from the contextual menu.
2. Click the Sharing tab.
3. Click "Shared as", and name the selected disk.

Windows 2000 or XP

1. Right-click the disk that is to be shared, and select Properties from the contextual menu.
2. Click the Sharing tab.
3. Click "Share this folder on the network", and name the selected disk.

You should now be able to connect as expected.
Published Date: Oct 10, 2016

Mac OS X 10.2: "SMB Connect Error = -36" Alert When Connecting to a Windows-Compatible Computer

If you see an alert box with the message "SMB Connect Error = -36", this means the Microsoft Window-compatible computer (PC) has refused your connection.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to connect to a Windows-compatible computer, an alert box with this message appears:

> "SMB Connect Error = -36"

Solution

There are many reasons why the connection may be refused by the shared Windows computer.

First, make sure that the share point you are trying to connect to is set up correctly and that other users can log in to the computer.

You should also verify that the user account you are using is set up properly. When you log in to the computer, make sure you are entering your user name and (case-sensitive) password correctly.

If you are connecting to Windows XP, make sure that the Internet Connection Firewall settings are not interfering with your connection. SMB uses ports 137, 138 and 139. These ports should be open on the Windows XP computer.

Additionally, you should review all of the notes in technical document 106471, "**Mac OS X 10.1 or Later: How to Connect to Windows File Sharing (SMB)**".

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iChat: Chat windows not named correctly

This article has been archived and is no longer updated by Apple.

Chat windows are labeled as "Instant Message" windows. This document explains how to tell the difference between the two.

Symptom

Chat windows are labeled as "Instant Message with <user_name>".

Solution

An "Instant Message" window is for interaction between two and only two users. You cannot add new participants to an Instant Message window. "Chat" is the term that describes instant messaging between three or more users in the same window. You may notice that Chat windows are labeled as Instant Message windows, even though they are functionally different. To distinguish between the two, click the silhouette button in the message window to open the Participants drawer. If the add participant button (the plus sign) is available, you have a chat window. The add participant button is dimmed (unavailable) in an Instant Message window.

For more information, see technical document 107099, "**iChat: Cannot Add User to Instant Message Window**".

Published Date: Feb 17, 2012

I can‘t add another person to my iChat Instant Message window

Use Chat to talk to two or more people at a time, instead of an Instant Message. This document applies to iChat 1.x and Mac OS X 10.2 or later.

This article has been archived and is no longer updated by Apple.

Start a Chat window to talk to more than one person. A Chat is for "conference" conversations with many people, and Instant Message is for private conversations with a single person.

If you want to be able to add more participants later, then you should start your message as a Chat window instead of as an Instant Message window. To start a Chat, simply choose **New Chat** or **New Chat with Person** from the iChat **File** menu.

Tip: When naming windows, iChat does not distinguish between Instant Message and Chat type windows. To learn how to distinguish them, see "iChat: Chat Windows Not Named Correctly".

Published Date: Oct 10, 2016

iChat: Speak Text Preference Sticks After You Try to Turn It Off

If you use the "Speak text" feature in the Actions preference pane of iChat, it may later stick after you try to turn it off.

This article has been archived and is no longer updated by Apple.

Symptom

iChat continues to speak text even though you tried to turn off that feature.

Solution

These steps are a workaround for turning off "Speak text":

1. Choose Preferences from the iChat menu.
2. Click the Actions icon.
3. Choose the affected event from the Events menu. (The affected event is what is happening when you hear the spoken text.)
4. Deselect the checkbox for "Speak text."
5. Deselect the checkbox for "Enable these actions."
6. Choose Quit iChat from the iChat application menu.
7. Reopen iChat.

You may now reselect "Enable these actions," so that other actions may be used for the affected event. Any time that you select "Speak text" for the affected event, you may have to repeat these steps to turn it off.

Published Date: Feb 17, 2012

Mac OS X 10.2: Inspector (Info) Window Quits Unexpectedly When Changing Name & Extension Field

If you try to change a filename extension (such as ".jpg") in the Inspector version of the Info window, both the Info window and Finder may quit unexpectedly.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to change a filename extension in the Name & Extension field of the Inspector version of the Info window, you experience these symptoms:

- The Finder becomes temporarily unresponsive, and the spinning disc pointer appears.
- A blank alert box appears, sometimes with an OK button.
- The Finder window and Inspector window disappear.
- The Finder restarts.

The computer is unresponsive for only a short period of time, perhaps 30 to 90 seconds, depending on your configuration. The computer functions normally afterwards.

Solution

If you need to change a filename extension, use the original style Info window. This is the default Get Info behavior in Mac OS X 10.2 or later. The symptom should not occur if you are only changing the first portion of the file name, leaving the extension as is.

Additional information

Mac OS X 10.2 offers both the original (Figure 1) and later (Figure 2) styles of what is now, in either case, called the "Info" window. The later style is also known as the Inspector. The appearance of the window types differs slightly.

Figure 1 Original style "Info" window"

Figure 2 Inspector style "Info" window

To learn more about the history of each Info window type, the advantages of each, and how to access the Inspector, see technical document 106148, "**Mac OS X: About Show Info, Get Info, and the Inspector**".
Published Date: Oct 10, 2016

Mac OS X 10.2: Cannot Change Account Settings of Logged-In User Until You Type Password

Admin users can edit the accounts of other Admin users without having to re-enter their passwords, known as reauthentication, but they must reauthenticate to edit their own accounts.
This article has been archived and is no longer updated by Apple.

Symptom

You go to the Accounts preference pane, select your own account, and click Edit User. All settings other than the Picture are unavailable for editing (dimmed). The dimmed settings include the checkboxes for "Allow user to administer this computer" and "All user to log in from Windows".

You may notice that the Lock button, which normally indicates when you need to authenticate, already appears open.

Only after typing your password do the settings become available.

Solution

Type your password in the Current Password field and press Return to make changes.

The appearance of the Lock button is misleading in this instance, and the authentication is inconsistent.

Mac OS X 10.2: Mac Help Viewer Does Not Open From the Keyboard

When using a Mac OS X application such as Mail or the Terminal, the Help key on the keyboard does not open Help Viewer.
This article has been archived and is no longer updated by Apple.

Symptom

When you press the Help key on the keyboard, the mouse pointer turns into a question mark; but the Help Viewer does not open.

Solution

Use the Help menu in the menu bar instead of the Help button.
Published Date: Feb 17, 2012

Mac OS X 10.2: Tab Completion and Aliases in Terminal Differ From Earlier Versions

After updating to Mac OS X 10.2, tcsh uses standard defaults for the shell. To use the customized aliases and completions from version 10.1.5 or earlier, see the tcsh Read Me file.
This article has been archived and is no longer updated by Apple.

Symptom

Tab completion and certain command aliases, such as 'll' and 'l', behave differently with Mac OS X 10.2 than with Mac OS X 10.1.5 or earlier.

Solution

Terminal in Mac OS X 10.2 defaults to industry-standard settings for tcsh, rather than to the highly customized default set used in version 10.1.5 or earlier. This change brings the default behavior of Terminal in line with other UNIX operating systems.

If you want to have some or all of the customized set that was previously used, see:

/usr/share/tcsh/examples/README

Note: If you follow the instructions in the README, you will see an issue in which, when logging into OS X computers via ssh, you see the alert message:

```
TERM_PROGRAM: Undefined variable.
```

You may safely ignore this message.

The error message is caused by a issue in the file /usr/share/tcsh/examples/aliases. If you are familiar and comfortable with editing files as root, you may resolve the error by commenting out these lines as illustrated:

#if ("$TERM_PROGRAM" == "Apple_Terminal") then
alias settermtitle 'echo -n "ESC]2;\\!:1^G"'
#endif
Published Date: Oct 10, 2016

Mac OS 9: Quicken 2001 Does Not Work After Update to CarbonLib 1.6

This document explains how to resolve an issue with Quicken 2001 and CarbonLib 1.6.
This article has been archived and is no longer updated by Apple.

Symptom

After updating to CarbonLib 1.6, Quicken 2001 quits unexpectedly when opened.

Solution

To resolve this issue, do one or both of the following:

- Turn on Virtual Memory in the Memory control panel.
- Upgrade to a Quicken 2002 or later.

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159: "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Application and folder names unexpectedly change to English (Mac OS X)

This article has been archived and is no longer updated by Apple.

When English is not selected as the preferred language, selecting the Finder preference for "Always show file extensions" causes Mac OS X-installed applications and folders to revert to their English names.

Note: This document applies to Mac OS X 10.2 through 10.3.9.

Symptom

Applications and folder names that formerly appeared in a localized, non-English language change back to English.

Solution

Deselect the Finder preference for "Always show file extensions." Follow these steps:

1. Click the Finder icon in the Dock.
2. Choose Preferences from the Finder menu.
3. Deselect the checkbox for "Always show file extensions."

Published Date: Feb 17, 2012

Mac OS X 10.2: Mail No Longer Checks for Local Mail

If a computer upgraded from Mac OS X 10.1 to 10.2 contains a local (UNIX) mailbox, the Mail application no longer checks for local mail.
This article has been archived and is no longer updated by Apple.

Symptom

Local mailboxes no longer work as expected.

Note: A "local" mailbox is one on a UNIX-style operating system that allows users of the same computer to exchange messages without sending them through an email server. Earlier versions of Mail had an option in Mail Preferences for "UNIX Account" that you could use with this type of local mail. This should not be confused with the On My Mac mailbox.

Solution

For new messages, send to local users as you would anyone else, via an email server.

An option you may consider for preserving this feature is to set up an IMAP server on the computer. IMAP is an included feature of Mac OS X Server 10.2. Though it is also possible to achieve IMAP service on the standard (non-server) version of Mac OS X, Apple does not provide technical support or instruction for this.

Note: If a local mailbox was present at time of the upgrade, it will have been moved to On My Mac. However, the mailbox no longer receives local mail.

Published Date: Oct 10, 2016

Mac OS X 10.2.1: Kernel Panic After Updating to 10.2.1 or Optimizing Mac OS Standard Volume

In a rare situation, a kernel panic may appear during startup after either updating to Mac OS X 10.2.1, or optimizing a Mac OS Standard (HFS) volume using third-party software. This issue is more likely if Mac OS X 10.2 is installed on a UNIX File System (UFS) formatted volume.
This article has been archived and is no longer updated by Apple.

Symptom

A kernel panic message appears during startup after updating to Mac OS X 10.2.1, or optimizing a Mac OS Standard volume. The most recent panic in the "panic.log" file contains the text:

> "kernel loadable modules in backtrace com.apple.BootCache (with dependencies)"

Solution

Use the following workaround:

1. Press and hold the Shift key during startup.
Note: If you cannot start up the computer this way, see technical document 106464, "**Mac OS X: Troubleshooting a Startup Issue**".
2. Click the Finder icon in the Dock.
3. Choose Go To Folder from the Go menu.
4. Type: /var/db
5. Click Go.
6. Locate this file: BootCache.playlist
7. Drag this file to the Trash.
8. Restart

Published Date: Oct 10, 2016

Mac OS X: Cannot see Mail Messages in Mail window

You are unable to see new or existing messages in the Mail window if the Mail window separator bar is set too high.
This article has been archived and is no longer updated by Apple.

Symptom

You cannot see Mail messages.

Solution

Your Mail window pane separator bar may be set too high. Click the bar and drag it down.
Published Date: Feb 17, 2012

Mac OS X 10.2: How to install additional printer drivers from Restore CDs

This article has been archived and is no longer updated by Apple.

Learn how to custom install additional printer drivers after Mac OS X 10.2 has already been installed.

Important: This document is for use with Mac OS X 10.2 Restore CDs. If you are using a (single) Restore DVD disc, stop here and see this article .

If you have already installed Mac OS X 10.2, you may later install the additional printer drivers by following these steps, or by visiting the printer manufacturer's website for a compatible driver:

1. Insert the Mac OS X 10.2 Install Disc 2. See Tips 1 and 2.
2. Double-click AdditionalPrinterDrivers.mpkg. Installer opens.
3. Authenticate by entering your account password when prompted.
4. Select the destination volume that contains Mac OS X 10.2.
5. Click Continue.

The selected software installs.

Tips

1. You do not need to start up from the Install CD.

2. Optionally, you may open a manufacturer-specific package, such as CanonPrinterDrivers.pkg, EpsonPrinterDrivers.pkg, HewlettPackardPrinterDrivers.pkg, or LexmarkPrinterDrivers.pkg.

Published Date: Oct 11, 2016

Mac OS X 10.2: Windows File Sharing (SMB) Computers Beyond Your Subnet Do Not Appear in Connect to Server Dialog

When browsing your local area network (LAN) via SMB, the protocol used for Windows File Sharing, some computers' names appear while others do not. The names that appear are those on your subnet.
This article has been archived and is no longer updated by Apple.

Symptom

In the Connect to Server dialog, you see the names of some but not all Windows File Sharing computers.

Note: A "sharing" computer refers to any computer using any operating system that is capable of sharing via SMB (Mac OS, Microsoft Windows, or other). However, computers experiencing the issue are only those using Mac OS X. SMB client computers using Microsoft Windows operating systems can see computers on other subnets.

Solution

SMB browsing in Mac OS X is limited to discovering workgroups and shared computers on your subnet.

The local subnet is defined as a collection of networked devices that are connected to the same networking media and/or to the same interface on a router. For more information regarding your subnet, see your network administrator.

Note: You may still connect via other normal means. The symptom only means that you cannot browse by name. To see how to connect via IP address or DNS name, see technical document 106471, "**Mac OS X 10.1 or later: How to Connect to Windows File Sharing (SMB)**".
Published Date: Oct 11, 2016

Mac OS X 10.2: Cannot Change Password Hint After Upgrading

After upgrading from Mac OS X 10.1 to Mac OS X 10.2, you cannot change your password hint. This document explains the workaround.
This article has been archived and is no longer updated by Apple.

Symptom

The Password Hint field is dimmed.

Note: This issue only affects Password Hint field. You may still change your actual password.

Solution

1. Open NetInfo Manager (/Applications/Utilities/).
2. Click the lock icon.
3. Enter your account password.
4. Click "users" in the center column.
5. Click your account name in the right-most column.
6. A list of account properties and values appears in the bottom window. Locate the property named "hint," which should appear fourth in the list. Note that the current password hint text appears to the right of hint. Click the hint text.
7. You may now edit the hint text.
8. When finished, choose Save Changes from the Domain menu.
9. A dialog box appears to confirm the change. Click "Update this copy".
10. Quit NetInfo Manager.

Published Date: Feb 17, 2012

Bluetooth: How to Remove Bluetooth Menu Bar Item When No Device Is in Range

This document explains how to remove the Bluetooth menu bar item when no device is in range.

This article has been archived and is no longer updated by Apple.

Press and hold the Command key while dragging the icon from the menu bar to an area below it. Any menu bar item can be removed using this method. (Menu bar items are replaced by opening the corresponding preference pane and reselecting them.)

Published Date: Oct 11, 2016

Mac OS X Server 10.2: "Cannot install due to Errors" over Mac OS X 10.2.1 (Client)

You must use a workaround to install Mac OS X Server 10.2 over a client (non-server) version of Mac OS X 10.2.1. This is because 10.2 server has some earlier component version numbers than 10.2.1 client.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to install Mac OS X Server 10.2, an alert box with this message appears:

> "Cannot Install due to Errors"

Solution

Follow these steps:

1. Start up normally from the target computer's Mac OS X startup disk (not from the Server CD).
2. Log in as an Admin user.
3. Open Terminal (/Applications/Utilities/).

Important: Commands that are typed as one line may appear below as two lines in your Web browser, due to text wrapping. To ensure that you enter them correctly, you may wish to copy and paste the text into Terminal.

4. Type: `sudo mkdir /Library/Receipts/Previous_Receipts`
5. Press Return.
6. Type: `sudo mv /Library/Receipts/French.pkg /Library/Receipts/Previous_Receipts/`
7. Press Return.
8. Type: `sudo mv /Library/Receipts/German.pkg /Library/Receipts/Previous_Receipts/`
9. Press Return.
10. Type: `sudo mv /Library/Receipts/Japanese.pkg /Library/Receipts/Previous_Receipts/`
11. Press Return.
12. Type: `sudo mv /Library/Receipts/BSD.pkg /Library/Receipts/Previous_Receipts/`
13. Press Return.
14. Quit Terminal.

You should now be able to start up from CD to install Mac OS X Server 10.2. This will create new receipts based on the packages in Mac OS X Server 10.2.

Note: If at any point you choose to repair permissions, they may be incorrectly set for certain items due to the new receipts. You should verify that global permissions correction is necessary. If, for example, an executable file is only allowed to be used by the root user, but an Admin user also requires the ability to execute the file, you would only need to adjust permission on that item to grant rights to the Admin user.
Published Date: Oct 11, 2016

Mac OS X 10.2: Windows File Sharing (SMB) Uses NetBIOS Over TCP (NBT)

Mac OS X 10.2 Windows File Sharing (SMB) uses the NetBIOS Over TCP (NBT) protocol.
This article has been archived and is no longer updated by Apple.
NetBIOS-NS (Name Service) uses Port 137 to discover and register the availability of SMB hosts and workgroups.

NetBIOS-DGM (Datagram) Port 138 is used to send and receive datagrams, for example when sending data among members of a workgroup.

NetBIOS-SSN (Session) Port 139 is used to send and receive data during SMB file sharing sessions.

For more information, see technical document 106439, "**"Well Known' TCP and UDP Ports Used by Apple Software Products**".
Published Date: Oct 11, 2016

iChat: Cannot Send a File Until After First Text is Sent

You cannot attach a file to a chat session until you have first sent text to the user.

This article has been archived and is no longer updated by Apple.

Symptom

When you click the paper clip icon you hear a beep. The dialog box that normally appears for selecting the file does not appear.

Solution

Send a text message to the person you're chatting with before clicking the paper clip icon to send a file attachment.

Mac OS X 10.2: Windows File Sharing (SMB) Browsing Limited to Your Subnet

You can only browse for Windows File Sharing (SMB) by computer name on your subnet.
This article has been archived and is no longer updated by Apple.
This is explained in technical document 107117, "**Mac OS X 10.2: Name Does Not Appear on Network for Windows File Sharing (SMB)**".
Published Date: Feb 17, 2012

Mac OS X 10.2: About Using Mac OS 9 Control Panels in the Classic Environment

The table below describes the functions of Mac OS 9 control panels within the Mac OS X 10.2 or later Classic environment.
This article has been archived and is no longer updated by Apple.
Note: The System Preferences application contains any "preference pane" to which the table refers. For the best possible experience, you should use System Preferences in place of certain working Classic control panels. When this is the case, it is stated in the Notes column. The Notes column also describes when a working Classic control panel offers less than its full feature set in the Classic environment.

Mac OS 9 control panels in Classic

Classic Control Panel	Usable?	Notes
Appearance	Yes	• Changes that are not apparent in Classic appear when, if ever, you start the computer up from Mac OS 9. • The desktop picture set in the Desktop preference pane always appears, whether or not you are in Classic. • Sound Track only works in Classic applications. • Changes to the System or Views font only affect the Classic environment and Classic applications.
AppleTalk	No	Use the Network preference pane instead. See technical document 107080, "Mac OS X 10.2: How to Make AppleTalk Active or Inactive in the Classic Environment".
Control Strip	No	None
ColorSync	Yes	Changes affect Classic environment applications only.
Date & Time	Yes	You can change the indicated formats and options, which only affect the Classic environment. You cannot change the date or time here. Use the Date & Time preference pane to set the date and time.
Energy Saver	No	Use the Energy Saver preference pane instead.
Extensions Manager	Yes	These settings are also found in the Advanced portion of the Classic preference pane.
File Sharing	Yes	The control panel may only be used to control Program Linking. File Sharing should be turned on in the Sharing preference pane instead. Note: AppleTalk must be enabled in Mac OS X Network preferences to use Program Linking.
General Controls	Yes	Options that affect only the Classic environment are available. Others are dimmed.
Internet	Yes	You should use the Internet preference pane instead. For more information, see technical document 107093, "Mac OS X 10.2: 'Internet Config. Extension error -677' Alert in Classic".
Keyboard	Yes	You may use this panel only to select the Classic keyboard layout. See the Keyboard preference pane for other options. There are no longer user-defined function keys in Classic.
Launcher	Yes	None
Location Manager	No	None
Memory	No	None
Modem	No	Use the Network preference pane instead.

Monitors	Yes	Use the Displays preference pane instead when possible. Certain Classic applications may require that you set the color depth to 256 colors, or the resolution to 640-by 480-pixels. In this case, you can use the Mac OS 9 Monitors control panel.
Mouse	No	Use the Mouse pane instead.
Multiple Users	No	Use the Accounts pane instead.
Password Security	No	This control panel does not work in the Classic environment. To require a password, open the Accounts pane and deselect "Log in automatically as <user name>".
PowerBook SCSI Disk Mode	No	None
Remote Access	No	Use the Internet Connect application instead.
Software Update	No	Use the Software Update preference pane instead.
Sound	Yes	Use only to select a sound input device for Classic applications. Use the Sound preference pane for other functions.
Startup Disk	No	Use the Startup Disk preference pane instead.
TCP/IP	No	Use the Network preference pane instead.
Trackpad	No	Use the Mouse preference pane instead.
Web Sharing	No	This may appear to work, but you should use the Sharing preference pane instead.
Apple Menu Options	Yes	This only affects recent items listed in Classic Apple. Mac OS X items do not appear in this menu but do appear in the Mac OS X Apple menu. Recent Mac OS X item settings may be configured using the General preference pane.
File Exchange	No	None
File Synchronization	Yes	None
Infrared	No	Use Network preferences (IrDA) instead.
Keychain Access	Yes	Affects Classic environment keychains only.
Numbers	Yes	Affects Classic environment applications only.
QuickTime™ Settings	Yes	Affects Classic environment use of QuickTime only.
Text	Yes	Affects Classic environment applications only.
USB Printer Sharing	Yes	Shares USB printers with Mac OS 9 clients. May be used simultaneously with Mac OS X USB Printer Sharing.

Software Update: Installed updates list is blank

On some computers using Mac OS X 10.2, the Installed Updates list found in the Software Update preference pane is blank (empty), even after a successful installation.

This article has been archived and is no longer updated by Apple.

Symptom

The Installed Updates list in the Software Update preference pane is blank after a successful installation.

This list normally contains the contents of the file /Library/Logs/Software Update.log.

Solution

To resolve this issue, you need to correct the permissions on the folder /Library/Logs/. The steps for doing so are found in technical document 107039, "**Mac OS X 10.2: How to Change Ownership & Permissions Using the Finder**".

You should then set them as follows:

- Owner: system
- Owner Access: Read & Write
- Group: admin
- Group Access: Read & Write
- Others: Read only

Notes

1. If you upgraded from Mac OS X 10.1, the Group Access permissions may be "Read only" instead of "Read Write".

2. To verify whether a software update was installed successfully, look for its receipt in the folder /Library/Receipts/.

3. This issue will occur if a non-Admin user is allowed to install via Software Updates. Do not allow non-Admin users to install via Software Update if this issue is undesirable.

Windows File Sharing: What Is a "Workgroup?"

This document defines a "workgroup" as it relates to Windows File Sharing.

This article has been archived and is no longer updated by Apple.

Mac OS X 10.2 includes Windows File Sharing. As part of its operation, it can specify a **workgroup**. A workgroup is to Windows File Sharing what an AppleTalk zone is to AppleTalk. It is a way network administrators can group related computers into smaller subgroups with meaningful names.

For example, all computers in the Sales department could have a workgroup of "Sales". All of the computers in the sixth grade classrooms could have a workgroup of "Sixth".

The default workgroup name is "WORKGROUP".

To change default workgroup that the server uses, use the Directory Access utility. See technical document 107137, "**Mac OS X 10.2: How to Change the Windows File Sharing Workgroup**".

Mac OS X 10.2: Internet Sharing Refers to Missing "Option Below"

Under certain conditions, the Internet Sharing pane may tell you to "select an option below" when there is none.
This article has been archived and is no longer updated by Apple.

Symptom

The Internet Sharing pane says "select an option below," but there are no options.

Solution

This occurs when only one network port is enabled, and that port is your AirPort card or modem. This is because you cannot simultaneously connect to the Internet and receive client connections (to be shared to) over either one of these ports. You must share between them, meaning at least two ports must be active. Ethernet is the only port over which you can simultaneously make and share an Internet connection.

1. Choose System Preferences from the Apple menu.
2. Choose Network from the View menu.
3. Choose Network Port Configurations from the Show pop-up menu.
4. Select the checkbox of each port configuration you wish to use.
5. Drag the port used for the active Internet connection to the top of the port list.
6. Click Apply Now.
7. Choose Sharing from the Show menu.
8. Click the Internet tab.

You should now have options available. The actual number of checkboxes will depend on the hardware configuration of the computer.

Mac OS X: About the Mac OS X 10.2.2 Update

This software updates Mac OS X 10.2.1 to version 10.2.2.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin user and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

Installation

There are two ways to update to Mac OS X 10.2.2.

I. Automatic Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

II. Standalone Installers

An installer is also available from Apple Software Downloads (http://www.apple.com/swupdates/).

Two versions of the installer are available. One is for updating version 10.2.1 to 10.2.2, the other 10.2 to 10.2.2 (a "Combo" update). This document describes the former. If you need to use the Combo update, see technical document 107141, "**Mac OS X: About the Mac OS X 10.2.2 Update (Combo)**".

Enhancements Delivered with this update

This update delivers many enhancements as outlined below.

Digital Hub and Peripheral Device Enhancements

- Improves playback of large media files and peripheral device file copying.
- Resolves a rare situation in which an inadvertently-ejected CD does not become available to the file system when reinserted and applications that accessed the disc cannot be quit.
- Addresses an issue in which an enhanced CD's data and audio sessions do not appear as expected on the desktop when using iTunes and inserting the disc more than once.
- Addresses a formatting issue that could occur when printing or previewing some TIFF documents.
- Addresses an issue in which ColorSync settings for some third-party displays are not retained after restarting or logging out.
- Addresses an issue when printing more than one copy of a file to a postscript printer from Adobe Photoshop 7.0.
- Improves compatibility with HP 4MV printers when printing over an Ethernet network.
- Includes drivers for additional third-party disc burners, including: LaCie d2 48x24x48x, Sony CRX-820E, Toshiba SD-R2212 and SD-R1202, Pioneer DVR-105, and Yamaha CDW-F1 44x24x44x models.

Networking and Modem Enhancements

- Windows File Sharing (SMB) shared volumes may now be browsed by their user-assigned name.
- Resolves an issue in which an incorrect "Change Password Failed" alert may appear when changing a Mac OS X 10.2 Server client's password via AFP.
- Addresses an issue in which some internal Apple modems may fail to respond, displaying a "Could not open the communication device" alert.
- Addresses an issue in which no sound is produced by some internal Apple modems until several seconds after making a connection.

- Resolves an issue in which some internal Apple modems fail to respond when connecting to the Internet.
- Alerts and warnings no longer appear when you cancel a connection to your iDisk in the connection dialog.
- Addresses a startup issue that could occur if an LDAP server designated in Directory Access is not available.
- Addresses a data loss issue that could occur when copying a file whose filename ends with "#02," or other hexadecimal number, via AFP.
- Available disk space on an iDisk is updated more quickly after deleting files.
- Addresses an issue in which an iDisk would appear with an inaccurate 1 GB capacity and 1023 MB available.
- Addresses some issues that could cause a "error -36" alert when copying files to an iDisk.

Address Book and Mail Enhancements

- Resolves an issue in which Address Book could become unresponsive when using the Large Type menu and switching between applications.
- Address Book can now better import groups from prior versions of Address Book.
- Resolves a potential issue when transferring vCards from Address Book to a mobile phone via Bluetooth.
- Allows address information to be imported when dragging vCards to Address Book that were created with Address Book from any version of Mac OS X 10.1.
- Corrects Address Book address format for Australian entries.
- Improves responsiveness when switching in and out of edit mode in the Address Book.
- Address Book entries without a name included now appear in the All group list with the email address as the name, instead of "<No Name>".
- Addresses the rare issue in which Mail may unexpectedly quit when replying to a message.
- Improves the responsiveness of the Mail application's date column and thread highlighting feature.
- Improves the reliability of transitioning a Mac OS X 10.1.5 "Address Book.addressbook" file to an Address Book for Mac OS X 10.2 format.

Application Enhancements

- Improves compatibility for Microsoft PowerPoint presentations that use animations.
- Addresses a potential Disk Copy volume imaging permissions issue that could affect non-Admin users.
- Applications installed with Mac OS X (Mail, Address Book, and so forth), are properly updated--even if you have dragged them from the Applications folder to another location.
- Addresses a display issue that may occur when Command-clicking a URL in some third-party applications, including BBEdit and Mailsmith.
- Addresses a situation in which the menu bar and Dock are not shown until you click the desktop is clicked after quitting a third-party game application.
- Addresses an issue in which some PDF files created with Mac OS X do not open as expected with Adobe Acrobat Reader 5.
- Reduces occurrences of "missing text" when browsing some webpages.
- Improves compatibility for FAXstf when a fax is being sent while the computer is restarted, shut down, or entering sleep mode.
- Disk Copy no longer requires multiple authentications when creating New Image from Device.
- Resolves an issue that could occur when selecting the Address Book card of an AIM Buddy in iChat.

Other Enhancements

- Improves security when using a read-write disk image volume in which "Ignore ownership on this volume" has been deselected.
- Addresses an issue in which Software Update notifications are turned off when upgrading from Mac OS X 10.1 to Mac OS X 10.2.
- Addresses an issue in which, after upgrading to Mac OS X 10.2, an unexpected value in a user's com.apple.LaunchServices.plist file could prevent proper startup.
- Addresses a potential kernel panic situation when using three video cards and more than 512 MB of RAM.
- Addresses a potential issue in which an unauthorized user could log in as a deleted user.
- Improves the Find function of the Finder by no longer finding items in invisible folders.
- Reduces the time required for switching between Sherlock channels when using a low-bandwidth connection
- Sherlock channels may now be saved as a file.
- Allows automatic login to work as expected following an Archive and Install.
- Improves time needed to wake some portable computers.
- Addresses a potential loss of video when waking some PowerBook computers from sleep after using DVD Player.
- Addresses a potential issue in which the computer does not respond when quitting DVD Player on some portable computers.
- Includes Apache version 1.3.27.
- Addresses a potential security issue in which access to system daemons could be blocked when RPC-based services are enabled.

Mac OS X: About the Mac OS X 10.2.2 Update (Combo)

This software updates Mac OS X 10.2 to version 10.2.2. It is a "combo" update that combines enhancements delivered with versions 10.2.1 and 10.2.2.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Users from the View menu. Select an Admin user and click Edit User. Click the Password tab. Change the password and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

Installation

There are two ways to update to Mac OS X 10.2.2.

I. Automatic Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

II. Standalone Installers

An installer is also available from Apple Software Downloads (http://www.apple.com/swupdates/).

Two versions of the installer are available. One is for updating version 10.2.1 to 10.2.2, the other 10.2 to 10.2.2 (a "Combo" update). This document describes the latter. If you already have updated to 10.2.1, see technical document 107140, "**Mac OS X: About the Mac OS X 10.2.2 Update**".

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with both Mac OS X 10.2.1 and Mac OS X 10.2.2. These enhancements are listed individually in these two technical documents:

107036: "**Mac OS X: About the Mac OS X 10.2.1 Update**"
107140: "**Mac OS X: About the Mac OS X 10.2.2 Update**"

Installation

There are two ways to update to Mac OS X Server 10.2.2.

I. Automatic Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Note: If you need to do this remotely, see technical document 107058, "**Xserve: How to Remotely Install Software Using the Software Update Command-Line Tool**".

II. Standalone Installer

An installer is also available from Apple Software Downloads (http://www.apple.com/swupdates/).

Two versions of the installer are available. One is for updating version 10.2.1 to 10.2.2, the other 10.2 to 10.2.2 (a "Combo" update). This document describes the former. If you need to use the Combo update, see technical document 107143, "**Mac OS X Server: About the Mac OS X Server 10.2.2 Update (Combo)**".

Enhancements delivered with this update

This update delivers many enhancements as outlined below.

File Services

- Includes a tool that allows you to create user home folders either manually or via a cron job.
- User can set new passwords when they log in by to Macintosh Manager.
- You can use characters such as "#02" in file names. See technical document 107144, "**Mac OS X 10.2: Data Loss When Copying a File Whose Filename Ends With '#02' or Other Hexadecimal Number via Apple File Service**".
- The interface for automatically connecting to server volumes is clearer.
- Static mounts allow paths containing a trailing solidus, or "slash".

File System

Introduces a journaling feature to the Mac OS Extended (HFS Plus) file system for Mac OS X. Search the Knowledge Base on "journaling" to find more information.

Macintosh Manager 2.2.2

- Mac OS 8.6 clients have their Documents path set to ~/Documents.
- Macintosh Manager 2.2.2 server/client work with the Password Server.
- Macintosh Manager 2.2.2 clients are able to connect to the server when the change password option is selected.

Mail Services

- The Mail Server counts mail messages against the mail database.

Network Services

- DHCP no longer displays client licenses/leases with TTL=0.

Open Directory / Password Server

- Password Server no longer requires DNS.
- Directory Setup allows you to specify the scope of the search.
- The LDAPv3 plug-in allows case insensitive attribute and record type mappings.
- The LDAPv3 plug-in allows mapping data type attributes to literal strings using '#' prefix.
- Faster startups at "network file system" when LDAP is using a custom search policy.
- Client times out if LDAP server is not available. See technical document 107147, "Mac OS X 10.2: May Not Start Up If LDAP Server Designated in Directory Access Is Not Available".
- LDAPv3 plug-in "rejects" error using a DHCP LDAP server now creates error log entry.

Printing Services

- Includes PAP queue auto-setup from Mac OS X clients.

Web Services

- Updated Apache2 to version 2.0.42.
- Improved Search Function.
- Updated SquirrelMail to version 1.2.8.
- SquirrelMail: Changed location of installed config files.
- Updated Apache to version 1.3.27.

Workgroup Manager

- Can import users when the server is bound to a parent NetInfo domain.
- Imported users adopt preset settings.
- Group Documents folder is placed in a Managed User's Dock.
- The User accounts tabs allow multiple selections with "Shift" and "Command" keys.
- New users use Password Server by default if it is enabled.
- Groups folder within the Groups share-point created automatically overnight.

Other Enhancements

- Corrects the issue that displayed password hints when the "Show password hint" option was disabled.
- The "Users can change their passwords" setting has been enabled in order for Macintosh Manager users to use the Password Server.
- Items added to Login Items automatically open.

Published Date: Oct 11, 2016

Mac OS X 10.2: Data Loss When Copying a File Whose Filename Ends With "#02" or Other Hexadecimal Number via Apple File Service

A kernel panic or data loss may occur if you copy a file whose filename ends with "#02" or other hexadecimal number via any Apple file service. This affects Mac OS X 10.2 clients copying to any version of any Apple file service, which may be served by Mac OS, or other operating systems.
This article has been archived and is no longer updated by Apple.

Symptom

When copying a file whose filename ends in a hexadecimal number with a leading pound sign (see "affected file names" below), either the client experiences a kernel panic or data loss occurs on the server. At the client, this occurs immediately after starting the copy, such as when you drag the file icon onto the server icon.

Data loss occurs at the server when you click Replace in response to an alert box that says the filename already exists. You may at this point see an "error" alert message. Files and folders on the server are then deleted.

Note: When a kernel panic occurs, you may see text stating that "You need to restart your computer," or it may take other forms. For help identifying a kernel panic, see technical document 106227, "**Mac OS X: What is a Kernel Panic?**"

"Server" in this context refers to any computer offering an affected service, whether or not its operating system is sold and marketed as a "server". Mac OS 8.6, for example, is a server when file sharing is turned on.

Affected file names

You will **always** see this issue with files whose filenames end specifically in **#02**, such as:

example_name#02

You **may or may not** see the issue with any filename ending in a pound-led hexadecimal number (file_name#<hex_number>). Examples look like:

example_name#10ade
example_name#123
example_name#dead

Note: Hexadecimal (base-16) numbers are any created from a set of these characters:

abcdef1234567890

This means that, by appearance alone, a hexadecimal number is not always distinguishable from a regular decimal (base-10) number, as in "example_name#123".

Services affected

This affects all versions of Apple file service, whether served by Mac OS or another operating system. This includes but is not limited to services known by these names:

- AppleShare, AppleShare IP
- File Sharing, Personal File Sharing
- Apple File Service
- Apple Filing Protocol (AFP)
- Windows 2000 Services for Macintosh
- Novell Native File Access for Macintosh

Solution

This issue is best prevented by updating to Mac OS X 10.2.2 or later, in which it is resolved. If you cannot update immediately, you should review this information:

Do not use filenames that end in **#<hex number>**, where "<hex number>" may be any hexadecimal number as described in the "Affected file names" section above. The safest course of action is not to use any pound signs in file names at all.

If a dialog asks if you want to replace another file appears when copying such a file, click Stop. Rename the file so that it does not end in #<hex number>. Then you may safely copy the file.

This document will be updated when more information is available.

Apple Remote Desktop: How to Install on a Remote Mac OS X 10.2 Server

This document describes how to install Apple Remote Desktop when your server is at a remote location that you cannot physically access, such as an Internet service provider co-location facility. These steps are for Mac OS X Server 10.2 or later.
This article has been archived and is no longer updated by Apple.
This process uses the Terminal and root access to the server. This document is intended for those who feel comfortable using the Terminal. Some notes will be included throughout the document to explain what is happening.

1. Insert the Apple Remote Desktop Installation CD into the computer you use to connect to the server for administration.
2. In the Finder, open the CD.
3. On the CD, navigate to the folder /English/Mac OS X/Packages. Here you should find the three required ARD packages, which are:

RDClient.pkg
RDDocs.pkg
RDPref10_2.pkg

4. Open the Terminal (/Applications/Utilities/).

Note: The following Steps 5 to 9 are used to securely copy the packages to the server.

5. Type: `scp -r`
Note: There is a space following the "r" in "`-r `". You must type this space for the command to be recognized. Do not press Return yet.
6. From the Finder, drag the three required packages into the Terminal window. This should automatically complete the files' pathnames for you. Do not press Return yet.
7. Type: `root@<server_address>:/tmp/`
Note: Here and in Step 10 you replace "`<server_address>`" with the actual IP address or DNS name of the server, so that it might look like "`root@myserver.example.com:/tmp/`" or "`root@10.0.1.2:/tmp/`", for example. Be sure that there is a space between the last file's pathname and "root@<server_address>:/tmp/". Your typed command should now look similar to:

```
[myhost:~] admin% scp -r /Volumes/Apple\\ Remote\\ Desktop\\ 1.1/English/Mac\\ OS\\
X/Packages/RDClient.pkg /Volumes/Apple\\ Remote\\ Desktop\\ 1.1/English/Mac\\ OS\\ X/Packages/RDDocs.pkg
/Volumes/Apple\\ Remote\\ Desktop\\ 1.1/English/Mac\\ OS\\ X/Packages/RDPref10_2.pkg
root@<server_address>:/tmp/
```

8. Press Return.
Note: If this is your first ssh connection to this server, you will be prompted for authorization. If so, type "yes" and press Return to continue.
9. You are prompted to enter the password for the root user of the remote server. Unless it has been deliberately changed, this is the password created for the original Admin user account during initial server setup. Enter the password, and press Return. The copy will start and, you'll see output that starts and ends, respectively, with these two lines:

BundleVersions.plist 100% |*****************************| 1454 00:00
...
software_version 100% |*****************************| 38 00:00

Note: In the remaining steps, you will connect to the server to install the three packages using the command line installer tool that is included with Mac OS X 10.2 and later.

10. In the Terminal type: `ssh root@<server_address>`
11. Enter the root user's password and press return.
12. Type: `cd /tmp`
13. Press Return. Your prompt should change to: `[server:/tmp] root#`
14. Type: `ls -l`
15. Press Return. You should see the three packages, possibly along with other items. The output should include:

```
total 0
drwxr-xr-x  3 root  wheel  102 Sep 27 17:06 RDClient.pkg
drwxr-xr-x  3 root  wheel  102 Sep 27 17:06 RDDocs.pkg
drwxr-xr-x  3 root  wheel  102 Sep 27 17:06 RDPref10_2.pkg
```

16. Execute the following three commands by typing and pressing Return at the end of each. You should see text messaging describing the process after executing the commands.

```
installer -pkg RDClient.pkg -target /
installer -pkg RDDocs.pkg -target /
installer -pkg RDPref10_2.pkg -target /
```

Note: If your Apple Remote Desktop Install disc is for version 1.0, then you should now take the additional step of updating your software. Execute these two commands by typing and pressing Return at the end of each. After the executing the first, you should see text indicating that the ARD update was found.

```
softwareupdate
softwareupdate 3214
```

17. Disconnect from the remote server by typing "`exit`" and pressing Return.

The installation should be complete. For actual configuration of the software, see technical document 106981, "**Apple Remote Desktop: How to Remotely Configure on Mac OS X Server 10.2**".

Mac OS X Server 10.2: Differences Between "Local" Home Directories in Server Admin and Workgroup Manager

Both Server Admin and Workgroup Manager have a Local option for Home directories. They are not the same.
This article has been archived and is no longer updated by Apple.
In Server Admin, the Local option was used to indicate that the user has a Home directory that resides on the server that Server Admin is being used to administer. The correct share point was selected, and the user's Home directory was accessible by other clients that were bound to the same Directory Service, typically NetInfo or LDAP.

In Workgroup Manager, the Local option is used to indicate the Home directory is local to the server. It is not available to clients bound to the same directory service. This is for users that log in using the local console for the server.

To achieve the same result as Server Admin's definition of Local in Workgroup Manager, the Network option must be used. For more detailed information, refer to pages 161 through 164 of the Mac OS X Server Administrator's Guide. It is located on the server in /Library/Documents/MacOSXServer.

Mac OS X 10.2: May Not Start Up If LDAP Server Designated in Directory Access Is Not Available

If Mac OS X is set up to access an LDAP server for directory services, it may not finish starting up completely when that server is not available. This article has been archived and is no longer updated by Apple.

Symptom

The computer appears to start up normally, but stops starting up near the end of the progress bar. If the computer is already started up, it may slow down or become unresponsive for extended periods of time.

Solution

Update to Mac OS X 10.2.2 or later for best results. For earlier versions, or if the issue persists, the steps below may be used to reach a resolution.

Click here for Mac OS X client.
Click here for Mac OS X Server.

I. Steps for Mac OS X

If the computer is already started up:

1. Open Directory Access.
2. If necessary, click the padlock and authenticate.
3. Deselect the checkbox for LDAP services.
4. Click Apply.

If the computer will not start up:

1. Start up into single-user mode by pressing and holding the Command-S key combination immediately after the system startup sound. Press the keys until you see text on the screen.
2. Check the volume with fsck. For instructions, see technical document **106214**.
3. After using fsck, type: `mount -uw /`
4. Press Return.
5. Type: `cd /Library/Preferences`
6. Press Return.
7. Type: `mv DirectoryService DirectoryService.old`
8. Press Return.
9. Type: `reboot`
10. Press Return.

Note: This will set all Directory Access configurations back to their default values."

II. Steps for Mac OS X Server

1. Start up into single-user mode by holding the Command-S key combination immediately after the system startup sound. Press the keys until you see text on the screen.
2. Check the volume with fsck. For instructions, see technical document **106214**.
3. After using fsck, type: `mount -uw /`
4. Press Return.
5. Type: `cd /Library/Preferences`
6. Press Return.
7. Type: `mkdir -m 775 DirectoryService.old`
8. Press Return.
9. Type: `mv DirectoryService/* DirectoryService.old`
10. Press Return.
11. Type: `reboot`
12. Press Return.

Note: The "*" character in step 9 is vital, as it prevents the deletion of important invisible files. If you followed these instructions incorrectly and

accidentally deleted the .DSTCPListening file, this command will create a new one:

```
sudo touch /Library/Preferences/DirectoryService/.DSTCPListening
```

Mac OS X 10.2: How to Save Attachments in Mail

This document describes how to open and save attachments from within a Mail message.
This article has been archived and is no longer updated by Apple.
To save an attachment from an email message, select the message and choose Save Attachments from the File menu. You may also use the methods below.

If the attachment is a file or folder:

1. Drag the icon of the file or folder from the Mail message to your desktop, or another Finder window.
2. Click the enclosure name in the Mail message to reveal the location of the enclosure in the Finder, then use the Finder to drag the file to a different location.
3. If the icon cannot be dragged from the Mail message, Control-click the icon in the Mail message. A contextual menu appears with options that include saving the enclosure to a different location.

If the enclosure is an image:

1. Double-click the image to open it in the default application, such as Preview.
2. Control-click the image to open the contextual menu, which includes options such as Open Attachment, Save Attachment or Save to Downloads Directory (in most cases the Desktop).

Note: If you are unable to open or select the enclosure, the enclosure may have been embedded in the Mail message as an inline graphic. If this is the case, you can forward the mail to yourself so that Mail can re-attach the image.

Apple Remote Desktop: Wake Feature Works for Ethernet Clients Only

The Wake Up command in the Manage menu works only for wired Ethernet-connected client computers. You cannot wake up wireless Ethernet clients using ARD.

This article has been archived and is no longer updated by Apple.

Symptom

A wireless client in the computer list appears as Unavailable when it is asleep.

Solution

As a workaround, you may use separate to-sleep times for the system and the display on the client computer. Assign a longer value to the system, and a shorter value to the display.

Mac OS X 10.2: Improves Classic Compatibility With USB Devices That Use Mac OS 9 Input Sprockets

The Classic environment of Mac OS X 10.2 allows some use of Mac OS 9 USB Input Sprockets.

This article has been archived and is no longer updated by Apple.

Mac OS X 10.2 can use Mac OS 9 USB Input Sprockets in the Classic environment. Some functions of USB input devices that Mac OS X recognizes are available to Classic environment applications. A Classic game that implements Input Sprockets, for example, may use a USB joystick.

Advanced features of the USB input device may not be available in the Classic environment.

Use a Mac OS X-native (Carbon or Cocoa) version of the software if available, or contact the manufacturer of the USB device for additional compatibility information.

Published Date: Feb 17, 2012

Mac OS X 10.2: About Using Kerberos

This document provides information for using Kerberos with Mac OS X 10.2.1 and Mac OS X Server 10.2.1.
This article has been archived and is no longer updated by Apple.
Kerberos is network authentication protocol developed at MIT to provide secure authentication and communication over open networks. In addition to the standard authentication method, Mac OS X Server uses the Generic Security Services Application Programming Interface (GSSAPI) authentication protocol to implement Kerberos v.5.

For more information on Kerberos

For general information on Kerberos, see MIT's Kerberos Web site (http://web.mit.edu/kerberos/www/).

For Macintosh specific information, see MIT's Kerberos for Macintosh Web site (http://web.mit.edu/macdev/Development/MITKerberos/Common/Documentation/index.html).

Setting up to use a Kerberos server

You must create and deploy an edu.mit.Kerberos configuration file. It needs to be located in the /Library/Preferences/ folder of every Mac OS X and Mac OS X Server computer that you want to authenticate via Kerberos. This file is not sensitive, so it can be placed on a guest-accessible volume.

For more information on the configuration file, see MIT's Kerberos for Macintosh web site (http://web.mit.edu/macdev/Development/MITKerberos/Common/Documentation/preferences-osx.html).

You may also consider installing the MIT Mac OS X 10.2 Kerberos Extras, as it will place an example edu.mit.Kerberos file in the /Library/Preferences/ folder.

If you are going to use a keytab file, create a host principal on the KDC and then copy a keytab file from the KDC to /etc/krb5.keytab on the client computer.

Enabling Kerberos Authentication for Login Window

For instructions on how to enable Kerberos Authentication for the Mac OS X 10.2 and Mac OS X Server 10.2 Login Window, see technical document 107154, "**Mac OS X 10.2: How to Enable Kerberos Authentication for Login Window**".

Setting up Mac OS X Server 10.2 services for use with Kerberos

For instructions on how to configure Mac OS X Server 10.2 services for use with Kerberos, see technical document 107155, "**Mac OS X 10.2: How to Integrate Services With Kerberos**".

When Kerberos Extras are required

If you plan on using Kerberized Carbon CFM applications, you need to install the MIT Mac OS X 10.2 Kerberos Extras.

For more information, see the MIT Mac OS X Kerberos Extras Web site (http://web.mit.edu/macdev/Development/MITKerberos/Common/Documentation/osx-kerberos-extras.html).

Note: If you installed the MIT Kerberos Extras on existing Mac OS X 10.1 Kerberos clients and have now upgrading to Mac OS X 10.2, you will encounter some unexpected behavior with Kerberized Carbon CFM applications. For more information, see technical document 107156, "**Mac OS X: Issues With Kerberized Carbon CFM Applications After Upgrading to Mac OS X 10.2**". Once you have updated to Mac OS X 10.2.1, you should install the MIT Mac OS X 10.2 Kerberos Extras.

Mac OS X: Enabling Kerberos authentication for Login Window

Do you need to learn how to set up Mac OS X and Mac OS X Server for Kerberos Authentication when logging in?
This article has been archived and is no longer updated by Apple.
Instead of following the instructions on page 200 of the "Mac OS X Server Administrator's Guide," follow these steps on each Mac OS X client computer where you want to use Kerberos authentication. This document applies to Mac OS X (client) 10.2.1 or later and Mac OS X Server versions 10.2.1 to 10.2.8. The configuration sets outlined in this document are not required with Mac OS X Server 10.3, because the configuration is completely automated when using Open Directory.

Setting up to use a Kerberos server

This document assumes that you have already have created and deployed the appropriate files:

- edu.mit.Kerberos
- krb5.keytab files.

For instructions on how to enable Kerberos Authentication for the Mac OS X 10.2 and Mac OS X Server 10.2, see Information for Using Kerberos.

Post-Login Kerberos Authentication

To configure the Kerberos login plug-in to obtain a Kerberos credential as a consequence of logging in, change the following lines in /etc/authorization:

Change:

```
        <key>system.login.done</key>
        <dict>
                <key>eval</key>
                <string>switch_to_user</string>
        </dict>
<!-- krb5auth:login can be used to do kerberos authentication as a
     side-effect of logging in.  Local username/password will be used.
  -->
```

to:

```
<!-- Do kerberos authentication as a side-effect of logging in.  Local username/password will be used.
  -->
        <key>system.login.done</key>
        <dict>
                <key>eval</key>
                <string>switch_to_user,krb5auth:login</string>
        </dict>
```

Notes

1. You are logging into a local user account before attempting to obtain a Kerberos ticket for a matching name and password. Because of this matching requirement, the account name and password must exactly match those stored on the Kerberos server.
2. The krb5auth:login step added to system.login.done is still available for 10.3. If you just want to try to get a kerberos ticket when logging in but not have it used to authenticate you, you can add it to system.login.done:

```
    <key>system.login.done</key>
    <dict>
            <key>class</key>
            <string>evaluate-mechanisms</string>
            <key>comment</key>
            <string>krb5auth:login can be used to do kerberos authentication as a side-effect of logging in.  Local username/password will be used.</string>
            <key>mechanisms</key>

             <array>
                     <string>switch_to_user</string>
                    <string>builtin:krb5login</string>
             </array>
    </dict>
```

Kerberos Authentication Required for Login

I. Simpler Configuration

To configure the Kerberos login plug-in to require that a user have a valid Kerberos account prior to logging in, change the following lines in /etc/authorization :

Change:

```
<!-- Login mechanism based rule.  Not for general use, yet. -->
        <key>system.login.console</key>
        <dict>

                <key>eval</key>
                <string>loginwindow_builtin:login,authinternal,loginwindow_builtin:success</string>
<!-- krb5auth:authenticate can be used to hinge local authentication on a successful kerberos authentication. -->
        </dict>
```

To:

```
<!-- Local authentication requires a successful kerberos authentication. -->
        <key>system.login.console</key>
        <dict>
                <key>eval</key>
                <string>loginwindow_builtin:login,krb5auth:authnoverify,loginwindow_builtin:success</string>
        </dict>
```

Notes

1. This configuration does not require an /etc/krb5.keytab file, but it is less secure than the following implementation.
2. The format of the authorization file has changed for 10.3.

system.login.console looks like this:

```
<key>system.login.console</key>
<dict>
        <key>class</key>
        <string>evaluate-mechanisms</string>
        <key>comment</key>
        <string>Login mechanism based rule.  Not for general use, yet. krb5auth:authenticate can be used to hinge local authentication on a successful kerberos authentication.</st
        <key>mechanisms</key>
        <array>
                <string>loginwindow_builtin:login</string>
                <string>authinternal</string>
                <string>loginwindow_builtin:success</string>
                <string>builtin:getuserinfo</string>
```

```
                <string>builtin:krb5auth</string>
        </array>
</dict>
```

In the passage above, "<string>authinternal</string>" is the default. It may be replaced with either of these two strings:

String	Action
<string>builtin:krb5authenticate</string>	do kerberos authentication, and verify the KDC
<string>builtin:krb5authnoverify</string>	(For Mac OS X 10.3) do kerberos authentication and skip verifying the KDC
<string>builtin:krb5authnoverify,privileged</string>	(For Mac OS X 10.4) do kerberos authentication and skip verifying the KDC

Nothing else is required for 10.3 and later. The system.login.done step is not required in these cases.

II. More Secure Configuration

This configures the Kerberos login plug-in to require that a user have a valid Kerberos account prior to logging in.

1. Change the following lines in /etc/authorization :

```
<!-- Login mechanism based rule.  Not for general use, yet.
  -->
        <key>system.login.console</key>
        <dict>

                <key>eval</key>
                <string>loginwindow_builtin:login,authinternal,loginwindow_builtin:success</string>
<!-- krb5auth:authenticate can be used to hinge local authentication
     on a successful kerberos authentication.
  -->
        </dict>
```

   To:

```
<!-- Local authentication requires a successful kerberos authentication.
  -->
        <key>system.login.console</key>
        <dict>
                <key>eval</key>
                <string>loginwindow_builtin:login,krb5auth:authenticate,loginwindow_builtin:success</string>
        </dict>
```

2. Create a host principal on the KDC, if you have not already done so. The string "host/mymachine.example.com" is an example of a host principal.
3. Copy a keytab file from the KDC to /etc/krb5.keytab on the client computer, if you have not already done so.

Mac OS X Server 10.2: How to Integrate Services With Kerberos

This document defines which Mac OS X Server Services support Kerberos Authentication and explains how to enable them.
This article has been archived and is no longer updated by Apple.
Note: To utilize the following configuration information you must update your computer to Mac OS X Server 10.2.1 or later.

These services support Kerberos Authentication:

- Apple Mail server (AMS)
- Apple File Protocol server (AFP)
- Apple FTP server
- Telnet
- Macintosh Manager Client Logins

Note: This document assumes that you have already have created and deployed the appropriate "edu.mit.Kerberos" and "krb5.keytab" files. For information on this and other basic setup, see these technical documents:

107153: "**Mac OS X 10.2: Information for Using Kerberos**"
107154: "**How to Enable Kerberos Authentication for Login Window**"

Kerberos for Apple Mail Server

1. Open the Server Settings application.
2. Click the Internet tab.
3. Choose Configure Mail Service from the Mail Service module.
4. Click the General tab in the Configure Mail Service window.
5. Select an authentication method from the Authentication pop-up menu that allows Kerberos authentication. The choice you make depends on your scenario:
    - Choose Kerberos if you want mail service to require Kerberos authentication for POP, IMAP, and SMTP. In this case, users' mail client software must support Kerberos. If a user's mail client does not support Kerberos, it will not be able to authenticate.
    - Choose Any Method if you want to allow but not require the use of Kerberos authentication. A mail client that does not support Kerberos can still use the standard authentication method(s).
6. Click the Save button.

Kerberos for AFP server

1. Open the Server Settings application.
2. Click the File & Print tab.
3. Choose Configure Apple File Service from the Apple module.
4. Click the Access tab in the Configure Apple File Service window.
5. Select an authentication method from the Authentication pop-up menu that allows Kerberos authentication. The choice you make depends on your scenario:
    - Choose Kerberos if you want the AFP service to require Kerberos authentication for an AFP client to connect. In this case, a user's AFP client software must support Kerberos. If a user's AFP client software does not support Kerberos, it will not be able to authenticate.
    - Choose Any Method if you want to allow but not require the use of Kerberos authentication. An AFP client that does not support Kerberos can still use the standard authentication method(s).
6. Click the Save button.

Kerberos for Apple FTP server

1. Open the Server Settings application.
2. Click the File & Print tab.
3. Choose Configure FTP Service from the FTP module.
4. Click the Advanced tab in the Configure FTP Service window.
5. Select an authentication method from the Authentication pop-up menu that allows Kerberos authentication. The choice you make depends on your scenario:
    - Choose Kerberos if you want the FTP service to require Kerberos authentication for a FTP client to connect. In this case, a user's FTP client software must support Kerberos. If a user's FTP client software does not support Kerberos, it will not be able to authenticate.

- Choose Any Method if you want to allow but not require the use of Kerberos authentication. A FTP client that does not support Kerberos can still use the standard authentication method(s).

6. Click the Save button.

Kerberos for Telnet

To set up Telnet support, edit the /etc/xinetd.d/telnet file to enable Telnet.

Kerberos for Macintosh Manager client logins

If Kerberos Authentication is available for all of your Macintosh Manager users, consider using Kerberos verification for Macintosh Manager users.

Note: By selecting the "Clients must authenticate using Kerberos" option, **all** Macintosh Manager client logins will utilize Kerberos. User Accounts that cannot be authenticated via Kerberos will not be able to log in as Macintosh Manager clients.

Follow these steps:

1. Open the Macintosh Manager application.
2. Click the Global tab.
3. Click the Security tab.
4. Select "Clients must authenticate using Kerberos".
5. Click the Save button.

All Macintosh Manager users are now required to authenticate using Kerberos to log in.

Note: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Apple offers these simply as additional resources for its customers. Please contact the vendor for additional information.

Mac OS X 10.2: Issues With Kerberized Carbon CFM Applications After Upgrading to Mac OS X 10.2

Existing Kerberos users may encounter different issues with Kerberized Carbon CFM applications after upgrading to Mac OS X 10.2.
This article has been archived and is no longer updated by Apple.

Symptom

If Mac OS X 10.2 is installed over a Mac OS X 10.1.5 Kerberos client on which either the MIT Mac OS X 10.1 Kerberos Extras or MIT Kerberos for Macintosh 4.0 had been installed, then you may encounter these two symptoms:

1. You may see an alert when the Kerberized Carbon CFM application tries to connect to a Kerberos enabled service. For example:

After upgrading to Mac OS X 10.2, when you open the Eudora email application, an alert box appears with a message that that one of the Kerberos libraries failed to initialize. Eudora then quits, and email cannot be accessed.

2. The application may be missing Kerberos authentication options. For example:

After upgrading to Mac OS X 10.2, the Fetch FTP application does not have any Kerberos authentication options available. The only available authentication option is to connect using a plain text password. Prior to upgrading to Mac OS X 10.2, the Preferences Security pane had Kerberos-related options, and New Connection windows had options to choose in the Security pop-up menu (KClient or GSS options in addition to a Cleartext password option).

Note: Similar issues can occur if either:

- A Mac OS X 10.2 Archive and Install was performed on a Mac OS X 10.1.x Kerberos client, or
- The MIT Mac OS X 10.2 Kerberos Extras were not installed on a new Mac OS X client.

Solution

1. Update to Mac OS X 10.2.1, if you have not already.
2. Install the MIT Mac OS X 10.2 Kerberos Extras.

For more information, see technical document 107153, "**Mac OS X 10.2: Information for Using Kerberos**".

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X: Software Update Notifications Turned Off After a 10.1 to 10.2 Upgrade

Automatic notification of software updates may be turned off after upgrading Mac OS X 10.1 to 10.2. This may also occur if the Software Update preference file is deleted.
This article has been archived and is no longer updated by Apple.

Symptom

You are no longer automatically notified of available software updates.

Note: This affects any version 10.1 to 10.1.5 when upgraded to 10.2 or 10.2.1. This may also happen if the Software Update preference is deleted. The issue is resolved in Mac OS X 10.2.2 or later.

Solution

To turn automatic notification back on, follow these steps:

1. Choose System Preferences from the Apple Menu.
2. Choose Software Update from the View menu.
3. Select the checkbox for "Automatically check for updates when you have a network connection".
4. If you wish to check for a Software Update immediately, click Check Now.

Published Date: Feb 17, 2012

Apple Remote Desktop: How to Reinstall After Updating

The Apple Remote Desktop 1.0 installer will not install after updating to a later version.
This article has been archived and is no longer updated by Apple.

Symptom

If you select a target volume in the Apple Remote Desktop (ARD) 1.0 Installer on which a later version of Apple Remote Desktop is already installed, an alert box with this message appears:

> "There are newer versions of some of the software packages in 'Apple Remote Desktop Admin' already installed on the volume 'Macintosh HD.' This software does not allow older versions to be installed on top of newer versions."

Note: This also applies to ARD Client. In this case, the message indicates Client rather than Admin.

Solution

Remove ARD by following the instructions in technical document 107159, "**Apple Remote Desktop: How to Uninstall**". Once ARD is removed, reinstall ARD 1.0 and then install the necessary updates.

Notes

1. The Install button will read Upgrade, which is normal in this situation.
2. After reinstalling 1.0, the later updaters should be run again.
3. The ARD 1.0 Installer will install properly onto Mac OS X 10.2.
4. If ARD 1.0 is installed on Mac OS X 10.2, do not attempt to use the Preference Pane before updating to 1.1.

Mac OS X 10.2: Sending Folders As Mail Enclosures Creates Additional Files

Mac OS X 10.2 Mail creates additional files when sending folders as enclosures.
This article has been archived and is no longer updated by Apple.

Symptom

When sending folders as an enclosure, Mac OS X 10.2 Mail creates a TIFF file for each file contained within a folder. The result is that the folder received contains twice the expected number of items.

Solution

As a workaround, use one of these alternatives:

- Open the folder in the Finder and use the Select All command to highlight the contents of the folder. Then drag all of the contents to the email message, or
- Use a third-party utility to compress the folder prior to attaching the item to your message. A compressed folder is attached as one file.

Published Date: Feb 17, 2012

Mac OS X Managed Client: Cannot Enforce Default Mail and Web Settings

If you use Workgroup Manager to specify a default download folder, email reader, email address, home page, mail server, search page, or Web browser, some applications may not accept these settings.
This article has been archived and is no longer updated by Apple.

Symptom

Some applications do not respect the default download folder, email reader, email address, home page, mail server, search page, or Web browser settings specified in Workgroup Manager.

Solution

Use the client computer's email and/or Web browser application's own preference settings instead.
Published Date: Feb 17, 2012

iChat: Pasted Emoticon Graphic Does Not Work as Expected

When you copy and paste an emoticon graphic (such as the smiley face), the pasted graphic does not appear in your message as expected.

This article has been archived and is no longer updated by Apple.

Symptom

Pasted emoticon graphics do not work as expected.

Solution

Emoticons are transmitted to your recipient via their text equivalents, such as :-) for the smiley face. When you copy and paste, you are attempting to send an inline graphic, so the desired result is not achieved. You may work around this by typing the text equivalent of the emoticon, subsequently copying and pasting it as many times as desired. Here is a list of emoticons used in iChat:

Smile	:-) or :)
Wink	;-) or ;)
Frown	:-(or :(
Undecided	:-/
Gasp	:-O or :O or =-O
Laugh	:-D or :D
Kiss	:-* or :*
Sticking out tongue	:-P or :P
Embarrassed	:-[or :[
Foot in mouth	:-! or :!
Cool	8-) or 8) or B-) or B)
Angry	>:-(or >:(or >:O
Innocent	O:-) or O:)
Cry	:'(
Lips are sealed	:-X or :X
Money-mouth	:-$ or :$

Published Date: Feb 17, 2012

Mac OS X Server: About FTP Macbinary File Encoding and Name Listing

FTP service in Mac OS X Server lists files with resource forks as Macbinary (files ending in ".bin") and automatically converts files to Macbinary when transferring them.
This article has been archived and is no longer updated by Apple.
In any version of Mac OS X Server 10.2 or later, FTP service uses an influence listing mechanism designed to ensure that served files are usable. It presents slightly modified file names to identify files of certain types. The user sees a modified file name, but neither the file nor its actual name on the server is changed.

A "file_one" that has a resource fork, for example, would be presented as "file_one.bin", mapping that file to the MacBinary format. If the user requests file_one.bin, the server attempts to convert the file to Macbinary on the fly, thereby preserving the resource fork. If the user requests file_one without specifying the .bin extension, the server will provide file_one without its resource fork, potentially rendering the file unusable.

This mechanism also increases the likelihood of maintaining the integrity of served Mac OS X applications and Mac OS 9-bundled applications by presenting them as disk images, with the .dmg filename extension.

The influence listing mechanism can be turned off by editing the FTP configuration file /Library/FTPServer/Configuration/ftpaccess to add this line to the end of the file:

```
influence_listings no
```

For help doing this, see technical document 106619, "**Mac OS X Server: How to Locate and Edit Configuration Files**".

Important: Be sure to quit the Server Settings application before modifying the ftpaccess file. If Server Settings is open while you modify the file, it will subsequently change the file back to its previous (undesired) state using data from its cache.

Mac OS X Managed Client: How to clear cached settings

This article has been archived and is no longer updated by Apple.

Follow the steps in this document to remove managed settings from your computer that persist after visiting a network on which clients are managed. This article applies to Mac OS X Server 10.2, 10.3. For information about Mac OS X Server 10.4, see this article.

To remove the managed settings, follow these steps:

1. If have not already done so, disconnect the Ethernet cable from the computer's Ethernet port, or turn off AirPort from the AirPort menu bar item, or do both. This removes the computer from the network on which Workgroup Manager is active.

2. Log in to the affected computer as an Admin user.
Note: If you are the network administrator, this refers to the computer's local Admin user, not to the server's.

3. At the Workgroup Picker dialog, click the Refresh Preferences button.
Note: If the Workgroup Picker does not appear after logging in, you must log out. You may then force the Workgroup Picker to appear by pressing the Shift key as you click the Log In button.

This will remove the cached settings.

If you skip step 1, you may temporarily clear the cached settings while still connected to the network. The settings will be re-cached when logging out or when clicking the Go Back button in the Workgroup Picker.

Mac OS X Server 10.2: Share Point Remains in Workgroup Manager After Being Deleted or Renamed

A reference to a share point may persist in Workgroup Manager after the actual shared folder that was the share point has been deleted or renamed.
This article has been archived and is no longer updated by Apple.

Symptom

- You can delete or rename a folder that is currently a share point (a behavior disallowed in earlier server products).
- A reference to the deleted or renamed share point remains in Workgroup Manager, and you cannot unshare it. If you try to unshare it, an alert box appears with a message that changes could not be saved.

This situation occurs if you delete the share point while Workgroup Manager is not connected to the server.

Solution

There are two methods for removing the undesired share point reference from Workgroup Manager.

Method 1

1. Quit Workgroup Manager, if it is open.
2. Create a new, empty folder with the exact name of the share point reference you wish to remove in Workgroup Manager. This folder must be created in or dragged to the exact location at which the deleted or renamed folder was or is located.
3. Open Workgroup Manager.

You should now be able to unshare the undesired share point reference.

Method 2

These undesired share point reference can be deleted using NetInfo Manager. Follow these steps:

1. Verify that the folder in question either no longer exists, or no longer exists under its former name (the undesired one that appears in Workgroup Manager).

Note: If you cannot unshare a folder that still exists in its original location with the name that appears in Workgroup Manager, you are experiencing a different issue.

2. When there are no connected users, use Server Settings to stop Apple File Services. Also be sure that Workgroup Manager is not connected.
3. Open NetInfo Manager (/Applications/Utilities/).
4. Click padlock, and enter your Admin user name and password.
5. Navigate to: /config/Sharepoints
6. Select the undesired share point reference and delete it.
7. Restart Apple File Services.

The next time you connect to the server with Workgroup Manager, the undesired reference should be gone.

Mac OS X: About Multicast DNS

This document describes Multicast DNS, one of the features incorporated in Bonjour, which was introduced in Mac OS X 10.2.
This article has been archived and is no longer updated by Apple.
Multicast DNS is one of the features of Bonjour (formerly "Rendezvous"), included in Mac OS X 10.2 or later. It allows you to connect via Internet protocol (IP) to other computers on a local network by name, rather than a numbered address.

On the Internet at large, a DNS name such as "www.apple.com" must be resolved to a numbered IP address before your computer can connect to the server. A domain name system (DNS) server normally provides this name resolution service for your computer. Your Internet service provider or network administrator normally provides a local DNS server for your use.

Conversely, Multicast DNS allows computers on a local network, such as home or small office, to look up each others' names and addresses without a DNS server. Each computer knows its own name and responds to requests for that name automatically via IP multicast.

Anywhere that a you could normally use a DNS name such as "www.apple.com", you could instead enter the Bonjour name of the computer on the local network. To indicate that the name should be looked up using local multicast instead of a standard DNS query, all Bonjour host names end with the extension ".local." This helps avoid confusion between names that are local Bonjour computer names ("mycomputer.local") and globally unique DNS names ("www.apple.com").

If you use local Bonjour computer names frequently and do not want to explicitly type ".local." every time, then this extension may be added to the Search Domains field in the Network preference pane. Click the TCP/IP tab in the Network preference pane to access the Search Domains field. Be sure you have selected the correct network port from the Show menu.

For more information about setting your Bonjour Name in Mac OS X 10.2, see technical document 106964, "**Mac OS X 10.2: About Your Computer's Bonjour Name**".

For more information about Multicast DNS in general, see the Multicast DNS website (http://www.multicastdns.org/).

Note: If you have set up a private DNS server that resolves names in the .local domain, computers using Mac OS X 10.2 will not use the DNS server to resolve these names. This may result in unexpected failures to connect to hostnames defined by your server. You should use a different domain, such as .home, .office, or .lan for DNS on private networks.

Mac OS X Server 10.2: Must Enter Router Address in Setup Assistant

The Setup Assistant for Mac OS X Server requires that a router address be entered. This document describes how to work around this for networks on which there is no router.

This article has been archived and is no longer updated by Apple.

Symptom

The Server Setup Assistant will not allow you to finish without entering a router address.

Solution

You may enter an arbitrary but valid IP address for the router. For simplicity, you should enter the server computer's IP address. After completing the Setup Assistant, you may change or remove the router address in the Network pane of the System Preferences application, which does not require a router address to be entered.

Mac OS X: How to Connect to an LDAPv3 Server Using a Self-Signed Certificate

You may connect to an LDAPv3 server via SSL using the Directory Services LDAPv3 plugin in cases in which you are using a self-signed certificate, or in which your certificate is not recognized.
This article has been archived and is no longer updated by Apple.
If you are using a self-signed certificate, or are having issues with your certificate from a Certificate Authority that is not recognized, follow these instructions to allow client connections via SSL.

1. Copy your public certificate file to a location of your choice on your Mac OS X startup disk. If you simply created a self-signed certificate, just use that certificate file in place of the Certificate Authority's public certificate.
2. While logged in as root, open the file /etc/openldap/ldap.conf in your preferred text editor.
3. In that file, add this line:

   ```
   TLS_CACERT
   ```

   Note: Replace "" with the actual pathname of your certificate file. It could look like:

   ```
   TLS_CACERT /Users/certificate_file
   ```

4. To enable certificate checking, remove the line "`TLS_REQCERT never`", if it is present, from /etc/openldap/ldap.conf.

   Note: The default setting in /etc/openldap/ldap.conf for Mac OS X 10.3 is to disable certificate checking. This is to support self-signed certificates in the out-of-box state.

5. Restart the computer.

Published Date: Oct 11, 2016

Mac OS X Server 10.2: Web Proxy Settings Lost During Upgrade

When upgrading a Mac OS X Server version 10.1 system to version 10.2, settings for the web proxy may be lost. This document explains how to reconfigure them.
This article has been archived and is no longer updated by Apple.
Note: This document refers to the server's own settings as a network client, not to the configuration of any proxy service the server may offer to its clients.

Symptom

Settings formerly in the Proxies section of the Network preference pane are missing after an upgrade to Mac OS X Server 10.2 or later.

Solution

If you have already upgraded, you will have to manually re-enter the proxy information.

If you have not yet upgraded and have enough proxy settings to justify using a workaround, you may follow these steps to save and reload them after the upgrade:

1. Log in to the Server as root. See technical document 106290, "**Mac OS X: About the root User and How to Enable It**".
2. Open the Terminal (/Applications/Utilities/).
3. Type: `cd /var/db/SystemConfiguration/`
4. Press Return.
5. Type: `cp preferences.xml preferences.xml.BeforeUpdate`
Note: When you upgrade the system, the proxy settings will still be overwritten; but you just saved a copy in this step.
6. Upgrade to version 10.2, and complete the Server Assistant.
7. Log in to the server as root.
8. Repeat Steps 2 through 4.
9. Type: `cp preferences.xml.BeforeUpdate preferences.xml`
10. Restart the computer.

When the system is restarted, the proxy information you had prior to the upgrade should be preserved.
Published Date: Oct 11, 2016

Mac OS X 10.2: Printing a TIFF File From Preview May Produce Mirror-Image, Reversed Output

On some computers, printing a TIFF file from Preview may result in output that is reversed in mirror-like fashion.
This article has been archived and is no longer updated by Apple.

Symptom

A TIFF file printed from Preview may print out in a reversed, mirror-like image. This effect may be horizontal or vertical. You may also see 90-degree rotation.

TIFF files print from other applications as expected.

Solution

This is resolved by updating to Mac OS X 10.2.2 or later.

If you cannot update immediately, you may open and print the TIFF file with Adobe Acrobat Reader, or another TIFF-compatible application. Alternatively, you may convert the TIFF file to another format.
Published Date: Feb 17, 2012

QuickTime Streaming Server 4: How to Reset a Lost Password and Admin User Name

If you know your QuickTime Streaming Server (QTSS) Admin user name and password, you may reset it in the QTSS Web admin application. This document explains how to reset the name and password if you have lost or forgotten them.

This article has been archived and is no longer updated by Apple.

This document applies to QuickTime Streaming Server 4 for Mac OS X Server 10.0.3 or later.

To reset the QTSS Admin user name and password:

1. Open Terminal (/Applications/Utilities/).
2. Type: `sudo qtpasswd user_name` **Note:** Replace "user_name" with the name of your choice, here and in the steps below.
3. Press Return.
4. Enter your Mac OS X Admin user password when prompted.
5. Press Return.
6. Follow the prompts, entering the user name of the computer's Admin user, followed by a password that you want to assign to the user user_name.
7. Using a text editor, modify the /Library/QuickTimeStreaming/Config/qtgroups file so that the user name just created or modified is included in the group Admin, as follows:
   `admin: user_name` **Note:** For help with this step, see "Mac OS X Server: How to Locate and Edit Configuration Files".
8. Save the file as ordinary text (not .pdf, .rtf, or any other file format).

Published Date: Feb 17, 2012

Mac OS X 10.2: About Multiple Users Features in Classic

This document describes the features for Multiple Users in Classic on a standalone computer.
This article has been archived and is no longer updated by Apple.
Mac OS X 10.2 includes preference management features for users on a standalone computer, one that is not managed via Workgroup Manager (a client management feature of Mac OS X Server 10.2 or later). Though Workgroup Manager is related, a server is not required to take advantage of these features on your standalone computer.

The Classic preference pane now includes a checkbox for "Use preferences from home folder". Click the Advanced tab to see it. The checkbox turns on a new feature in Classic that facilitates Workgroup Manager by redirecting the location of certain Classic preference folders. These folders are normally in the Classic System Folder and thus shared by anyone using the system; but when the "Use preferences from home folder" checkbox is selected, the folders are stored in the Home directory of the user that is currently logged in. This is the path: ~/Library/Classic/

This feature is automatically selected and cannot be deselected when the computer is part of a managed workgroup. When your computer is not being managed by a server, you may select or deselect the feature as you wish.

When used on a standalone computer, this would allow each Classic user to have her own desktop picture, bookmarks file, and Launcher items, for example. The complete list of redirected items is found below. This allows you to approximate the Mac OS 9 Multiple Users experience in Mac OS X. When working towards this goal, remember that file system access (and thus user privacy) is controlled by Mac OS X privileges and not by Classic. This means that how private or individual the Multiple Users experience is in Classic depends on how you have your computer set up. If you have only one volume (which is the default), enable the "Use preferences from home folder" setting immediately after initial setup, and have applications that respect the Home directory model (forcing users to save in their individual Home directories), then the experience may be very individual. Conversely, if you have multiple volumes, with the Classic System Folder on a separate volume, users may be able to access each others Classic preferences or other files. This would depend on how permissions are set for the additional volume(s).

Redirected preferences

When starting Classic with this checkbox selected, any redirected folders that exist in the System Folder, but not in the user's Home directory, will be created automatically. If any of the folders being created contained files, a dialog box will appear asking if Classic should populate the newly created folders in the user's Home directory with the contents from the redirected folders. If you click No, that user will not have the Chooser in the Classic Apple menu. For this reason, you should Click Yes, unless you have a specific reason not populate the information.

The following folders are subject to redirection:

- Apple Menu Items
- Desktop Pictures
- Favorites
- Internet Search Sites
- Keychains
- Launcher Items
- Locations
- Preferences
- Shutdown Items
- Shutdown Items (Disabled)
- Startup Items
- Startup Items (Disabled)
- Volume Settings

For related information see technical document 107180, "**Mac OS X 10.2: How to Manage User Access to Applications, System Preferences, and Disc Burning via 'Capabilities'**".

Apple Remote Desktop 1.2: About Encrypted Communication

When using the Remote Desktop application to connect to an Apple Remote Desktop (ARD) client, some of the communication is encrypted.

This article has been archived and is no longer updated by Apple.

Authentication

To a Mac OS 9 client computer using ARD 1.0 to 1.2

When adding client computers in the Remote Desktop application, the authentication is encrypted using a random number exchange. When Remote Desktop establishes communication with client computers, the Remote Desktop application re-authenticates with the client. (This is seamless to you, as the client already belongs to a list in the Remote Desktop application). This re-authentication is also encrypted using a random number exchange.

When you administer a remote computer, the Remote Desktop application sends a request to the remote ARD client. The remote ARD client responds with a random number. The Remote Desktop application combines the password that you typed with the random number received from the client and performs a one-way hash. This result is sent to the client, and the client makes the same calculation with the local password for that user. If the result matches what the Remote Desktop application sent, then you are granted access to administer the computer.

Since the password is combined with a different random number each time, the login packet is always different.

Authenticating to a Mac OS X client computer using ARD 1.0 or 1.1

This authentication is similar to the authentication done with a Mac OS 9 client in that it also is a random number exchange with a one-way hash of the password. It is different in that this authentication is done with both a user name and a password. With ARD 1.0 and 1.1, the user name has to be sent in the clear, but the password is hashed with a better hash algorithm (SHA1).

To a Mac OS X client computer using ARD 1.2 and 2.x

In Remote Desktop 1.2 and 2.x, authentication is based on a Diffie-Hellman Key agreement protocol that creates a shared 128-bit key. This shared key is used to encrypt both the name and password using the Advanced Encryption Standard (AES). The Diffie-Hellman Key agreement protocol used in ARD 1.2 and 2.x is very similar to the Diffie-Hellman Key agreement protocol used in personal file sharing, with both of them using a 512-bit prime for the shared key calculation.

Administration

When administering with Remote Desktop 1.2 and 2.x, keystrokes and mouse events are encrypted when controlling Mac OS X client computers. This information is encrypted using the Advanced Encryption Standard (AES) with the 128-bit shared key that was derived during authentication.

Note: The VNC protocol does not encrypt keystrokes sent over the network, so sensitive information can be intercepted over the network when using a non-Apple VNC viewer.

Other

There is no encryption for controlling Mac OS 9 client computers. Also, there is no encryption of any of the other communication between the administrator computer and the Mac OS X or Mac OS 9 client computers.

Warning: If you are using ARD to manage computers over public networks, consider using a virtual private network (VPN) solution to protect your information.

Published Date: Feb 17, 2012

Mac OS X 10.2: Terminal - Windows Close But Application Will Not Quit

The Terminal application in Mac OS X 10.2 includes a preference for "Prompt before closing window". If this preference is set to Never, and processes in an open window are active, then Terminal will not quit.
This article has been archived and is no longer updated by Apple.

Symptom

When you choose Quit in Terminal while active processes are in an open window, the window closes; but Terminal does not quit.

Solution

Choose Force Quit from the Apple Menu, and force quite the Terminal.

You can avoid this issue by either stopping all processes before quitting, or by closing the Terminal window before choosing Quit.

You can prevent this situation in other Terminal windows by doing the following:

1. Open Terminal. If a new window is not automatically opened, choose New Shell from the File menu.
2. Choose Window Settings from the Terminal menu.
3. Choose Processes from the pop-up menu in the Terminal Inspector window.
4. Under "Prompt before closing window", choose "Always" or "If there are processes other than".
5. If necessary, click "Use Settings as Defaults" . This will apply your changes to all new Terminal windows.

Published Date: Feb 17, 2012

Mac OS X 10.2 (Australia): Not All Time Zones Are Available in System Preferences

This document explains how to select Australian time zones that are not displayed in the Date & Time preference pane.
This article has been archived and is no longer updated by Apple.

Symptom

The time zone you need does not appear in the Date & Time preference pane.

Australia has a large number of time zones in use during the transition from standard time and daylight savings time, particularly since states and certain locations change on different dates. The transition typically spans a month. Incorrect time settings can contribute to incorrect behavior of email, paging services, and some network backup solutions.

Solution

The information for all time zones in Australia is contained in the files at:

/usr/share/zoneinfo/Australia/

The contents of these files is in binary format, but their names are locative in nature. For example, the "Darwin" file contains time zone information for Darwin and the Northern Territory; and "Broken_Hill" for the Broken Hill Region. You should not attempt to edit, rename or modify these files. If you list the contents of the directory, you will see these names:

```
H2N2079P2:share/zoneinfo/Australia] mdh% ls
ACT          Canberra     Lindeman     North        Sydney       Yancowinna
Adelaide     Darwin       Lord_Howe    Perth        Tasmania
Brisbane     Hobart       Melbourne    Queensland   Victoria
Broken_Hill  LHI          NSW          South        West
```

You should decide which locality's file you need to use before continuing.

The symbolic link /private/etc/localtime is set to point to the appropriate zone file for time zone information. Normally, this link is set automatically from the Time Zone section of the Date & Time preference pane. If your time zone or locality is not shown there, the following procedure can be used to set the system's time zone correctly:

1. Open Terminal (/Applications/Utilities).
2. At the prompt type :

```
sudo ln -sf /usr/share/zoneinfo/Australia/Darwin /private/etc/localtime
```

Note: This example is for Darwin. For other locations, substitute the name of the file that matches the desired locality. Note the space that is between Darwin (the locality name) and "/private/etc/localtime". Be sure to maintain this space when you type the command for your locality.

3. Press Return.
4. Type your Admin user password when prompted, then press Return.
5. Quit Terminal

This document will be updated as more information becomes available.
Published Date: Feb 17, 2012

Mac OS X: Software Updates require more free disk space than update‘s size

This article has been archived and is no longer updated by Apple.

Installing a software update(s) may require more disk space than the total size of the update(s). If you do not have enough available disk space, you may see an alert message stating that you cannot install the update because you do not have enough disk space. This article applies to Mac OS X 10.2 and later.

You should always have enough free hard disk space on the Mac OS X startup volume. The exact amount needed depends on how the computer is used. Free space is used for virtual memory, iDisk (if you use .Mac), system and Internet cache files, and other temporary files.

When installing an update in Mac OS X 10.2 or later, disk space is needed for:

- Downloading the compressed update
- Decompressing the update without deleting the original download (the decompressed installation package is usually larger than the downloaded, compressed update)
- Installing from the uncompressed source package
- Any temporary files used during post-installation optimization

A downloaded update may be 50 MB large when downloading, for example, but may require 300 MB or more of free disk space to install. After installation (and restarting, if necessary), the temporary files should be deleted automatically if you're using Software Update.

Making more disk space available

To free up more space on the Mac OS X disk, or to effectively utilize what space you have, use these tips:

- Empty the Trash (if you have multiple user accounts, log in to each and do this).
- Restart the computer. If the computer has been in use for a while, restarting it may reduce temporary files that could be taking up space.
- If you need to install more than one software update, install them one at a time.
- Check your Applications folder for multiple versions of an application, and delete the earlier version if it's not needed (for example, you might have an iWork '06 and iWork '08 folder, but no longer need iWork '06). **Note**: You should not relocate Apple applications such as Safari, iTunes, or iPhoto from the Applications folder to a different location, software updates for Apple applications expect them to be in the Applications folder.
- Back up large, non-essential files (such as ones on your desktop or in your Documents folder that you rarely use) to another volume and delete them from your Mac OS X volume.
- Check your Shared folder (it's in the /Users/ folder) for any unnecessary files and delete them or back them up to a different disk.
- Open QuickTime preferences, in System Preferences, click the Browser tab. If "Save movies in disk cache" is selected, click the Empty Download Cache button.
- Empty your Web browser's cache. For example, in Safari, choose **Empty Cache** from the **Safari** menu.
- Consider purchasing an additional or external hard drive, if your current hard drive capacity does not meet your needs.

Mac OS X Server 10.2: How to Turn off Automatic MacBinary Encoding

The FTP Server in Mac OS X Server 10.2 automatically encodes some files in MacBinary, adding the filename extension ".bin". This document explains how to disable this feature.
This article has been archived and is no longer updated by Apple.
To turn off the automatic MacBinary-encoding feature, edit the file /Library/FTPServer/Configuration/ftpaccess to add this line to the end of the file:

```
influence_listings no
```

For help doing this, see technical document 106619, "**Mac OS X Server: How to Locate and Edit Configuration Files**".

Note: Many Macintosh FTP clients automatically encode the file in the format dictated by their preference settings prior to posting to the server. For more information on this feature, see technical document 107171, "**Mac OS X Server 10.2: About FTP Macbinary Encoding and Name Listing**".

For more information on the MacBinary file format, see technical document 7328: "**MacBinary: File Format Description**".

Mac OS X: Application Quits After Requesting Passwords in Keychain Using AppleEvents

Sending remote AppleEvents to request keychain access for a stored username and password may cause the requesting application to quit unexpectedly or stop responding.
This article has been archived and is no longer updated by Apple.

Symptom

- The calling application may unexpectedly quit or stop responding. This only occurs if the dialog box asking for access to the keychain appears.
- Alternatively, the event may fail while leaving the calling application unaffected.

Solution

You may use one of these workarounds:

1. Enter the username and password in the URL. For example: eppc://user:password@your.system
Warning: Providing username and password in this format may create security issues over a network

2. Do not save the username and password for the target computer in the keychain. This preference is selected or deselected in the authentication dialog when asked for the username and password for the target computer.

Published Date: Feb 17, 2012

iChat stops responding or "Could not connect to Rendezvous" appears (Mac OS X 10.2)

Learn why iChat may stop responding ("freeze") or display the message "Could not connect to Rendezvous."

This document applies to Mac OS X 10.2 through 10.2.8

This article has been archived and is no longer updated by Apple.

Besides the message "Could not connect to Rendezvous. Login failed: couldn't open session" appearing, one of these things might happen:

- Starting a chat or file transfer from your Rendezvous Buddy list does not work. You may see an empty, white chat window.
- iChat displays a spinning disc cursor and is unresponsive.

The first and easiest solution is to restart, then try to login to iChat. If the issue is resolved, you don't need to do anything else.

If it isn't fixed, it might be caused by not having the Mac OS X BSD Subsystem installed. It is installed as part of a default installation, unless you chose to perform a custom installation that excluded the BSD Subsystem package. If this is your situation, you must install the BSD Subsystem software. See "Mac OS X 10.2: How to Install the BSD Subsystem After Mac OS X 10.2" for more information.

Finally, the Mac OS X Firewall, found in the Sharing preferences, can block the port used for local iChat traffic (port 5298). Firewall blocks this port in its default configuration. Follow these steps:

1. Open System Preferences.
2. Click Sharing.
3. Click the Firewall tab.
4. Click Stop.
5. Click the New button.
6. Choose Other from the Port Name pop-up menu.
7. In the Port Number field, type: 5298
8. In the Description field, type: "Rendezvous"
9. Click OK.
10. Click Start.

Published Date: Feb 17, 2012

Mac OS X: Apple menu follows language of active application, not that selected for system

This article has been archived and is no longer updated by Apple.

Items in the Apple menu do not appear in the preferred system language. When an application appears in a different language, the Apple menu takes on the language of that application.

Tip: This document applies to Mac OS X 10.0 through 10.3.9.

When an application is not localized for the preferred language, as defined in the International pane of System Preferences, it appear in the next-highest ranked language for which a localization is available. The Apple menu in this instance follows the language of the application, and not of the system. You may work around this issue by clicking the Finder icon in the Dock prior to opening the Apple menu.

Published Date: Feb 17, 2012

Mac OS X Server: How to Create the Postmaster Account

This document explains how to create the UNIX postmaster account in Mac OS X Server 10.0.3 or later.
This article has been archived and is no longer updated by Apple.
An Admin user may designate a user account to receive blind carbon copies (Bcc) of mail sent to the system or to unknown local users. Though any account on the system can be designated to receive this mail, the traditional UNIX user is the "postmaster" user. If you would like to set up a postmaster account on your system, create a user with a long name of "postmaster" and a short name of "postmstr". The latter accommodates the eight-character short name limit present in server versions 10.0.3 to 10.1.4. Mac OS X Server 10.2 and later allow the "short name" to be as long or longer than the "long name," up to 255 characters.

Alternately you may create an account of your own choosing and use it as you would the postmaster account.

Mac OS X 10.1: Address Book - Preferences Command Dimmed

Preferences for Address Book are dimmed, or unavailable, in Mac OS X 10.1 to 10.1.5. The LDAP function previously found there can be had by using Mail, or by upgrading to Mac OS 10.2 or later.
This article has been archived and is no longer updated by Apple.

Symptom

The Preferences command in the File menu of Address Book is dimmed.

Solution

For the affected Mac OS X versions, you may use LDAP services in the application Mail.

You may also upgrade to Mac OS X 10.2 or later, in which Preferences (including LDAP) are available in Address Book.
Published Date: Feb 17, 2012

Mac OS X 10.2: PPTP Does Not Remember Password

When making a PPTP connection in Internet Connect, you may be asked for your keychain password, despite having set the password to be saved. You see visual indication of a saved password (bullet characters), but the password is actually blank until you unlock the keychain.
This article has been archived and is no longer updated by Apple.

Symptom

Your saved keychain password setting is not honored when making a PPTP connection.

Solution

You must work around the issue by reentering the keychain password when asked.
Published Date: Feb 17, 2012

Mac OS X 10.2 Mail: Address Auto-Completion Uses "Most Often Used" Address

Mac OS X 10.2 Mail prefers the "most often used" address when auto-completing addresses in the address field.
This article has been archived and is no longer updated by Apple.

Symptom

Mail prefers the most often used address over the most recently used address when auto-completing addresses.

Solution

When entering an address, Mail selects the most commonly used address based on your usage history of each address in your Address Book.

For example, if choosing between two addresses for the same recipient, Mail will choose the address most often used, not the most recently used.

For more information, see technical document 107202, "**Mac OS X 10.2 Mail: LDAP Search Begins When Second Character In Address Field Entered**".
Published Date: Feb 17, 2012

Mac OS X 10.2 Mail: LDAP Search Begins When Second Character in Address Field Is Entered

Mac OS X 10.2 Mail will begin an LDAP search for an address when the second character of an address is entered in the address field.
This article has been archived and is no longer updated by Apple.

Symptom

Mac OS X 10.2 Mail does not use LDAP when only the first character of an address is entered in the address field. It waits for the second.

Solution

When you enter the first character of an address, Mail will search the local directory only.

If you have configured Mail to use an LDAP server, it searches both the local and remote directory for an address after you enter the second character. All subsequent characters entered into the address field cause Mail to search local and remote directories.

For more information, see technical document 107201, "**Mac OS X 10.2 Mail: Address Auto-Completion Uses 'Most Often Used' Address**".
Published Date: Feb 17, 2012

Mac OS X 10.2: Scanners Compatible With Image Capture

Mac OS X 10.2 version of Image Capture is compatible with scanners, as described below.
This article has been archived and is no longer updated by Apple.
Note: Mac OS X 10.2.1 or later is recommended for best scanner performance. See technical document 106704, "**Mac OS X: How to Update Your Software**".

Epson scanners

In Mac OS X 10.2, scanner drivers are included for:

- EPSON Perfection 1640 (outside the United States: GT-8700)
- EPSON Perfection 1650 (outside the United States: GT-8200)
- EPSON Perfection 1660 (outside the United States: GT-8300)
- EPSON Perfection 2400 (outside the United States: GT-9300)
- EPSON Perfection 2450 (outside the United States: GT-9700)

TWAIN-compatible scanners

Additionally, Mac OS X 10.2 can use TWAIN-compatible scanners connected to USB ports, once a Mac OS X-compatible TWAIN Data Source is installed. Contact your scanner vendor for information about a Mac OS X 10.2-compatible TWAIN Data Source for your scanner. TWAIN-compatible scanners that worked without Image Capture in Mac OS X 10.1 must be updated to work with Image Capture in Mac OS X10.2.

Scanners in Classic

Scanners with Mac OS 9-compatible drivers may be usable in the Classic Environment. Contact the scanner vendor for compatibility information.

Other scanners

Scanners not listed above may also be compatible with Mac OS X 10.2 by using applications other than Image Capture and scanner drivers compatible with Mac OS X 10.2. Contact your scanner vendor for Mac OS X 10.2 compatibility information.

Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

You should seek additional support information from documents included with third-party software, from Web-based help at the software manufacturer's Web site, or by contacting the third-party's support personnel when applicable.

Document 17159: "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.
Published Date: Feb 17, 2012

Mac OS X 10.2: Volume Formats Compatible With Classic

This document lists the volume formats (file systems) on which Classic in Mac OS X 10.2 can open and save files.
This article has been archived and is no longer updated by Apple.
Except as noted below, the Mac OS X 10.2 classic environment can now use any local or network volume format available to Mac OS X-native applications.

Local Volumes
Internal and external volumes, both removable and non-removable (fixed) volumes not on the network

- Mac OS Standard
  Also called Hierarchical File System or HFS
- Mac OS Extended
  Also called HFS Plus
- UNIX File System
  Also called UFS, (Note 2)
- Universal Disk Format
  UDF, used by DVD discs (DVD-ROM, DVD-Video)
- ISO-9660
  A cross-platform CD-ROM format
- Audio CDs
- Microsoft MS-DOS
  or File Allocation Table (FAT)
- Other CD formats
  See Notes 1 and 4.

Network Volumes
Also called remote disks

- Network File System
  or NFS (Note 2)
- Apple File Protocol (AFP)
- Distributed Authoring and Versioning
  Also DAV or WebDAV
- Server Message Block
  or SMB (Note 2)
- File Transfer Protocol (FTP)

Notes

1. Photo CDs and some multisession CDs cannot be used by Classic applications. As a workaround, copy the files to the hard disk. For Kodak Photo CDs, see technical document 42579 "**Mac OS X: Kodak Photo CD Capabilities**".

2. Although Classic works with this volume format, Mac OS 9 can only do so with the addition of third-party software (SMB, DAV, NFS, UFS).

3. While Classic can read data from the volumes listed above, the System Folder used to run Classic has to be on a Mac OS Standard Format (HFS) or Mac OS Extended format (HFS Plus) volume.

4. Any volume format that the Mac OS X Finder can read should be available to Classic. If it is not, you can copy the desired files off of the volume onto the startup disk or other volume whose format is available to Classic.

Mac OS X 10.3: Asian characters unexpectedly replaced by ASCII

This article has been archived and is no longer updated by Apple.

Asian characters may be replaced by ASCII characters if the second Mac OS X Installation CD was skipped during the installation process.

Note: This document applies to Mac OS X 10.3 through 10.3.9.

Symptom

Asian characters are replaced by ASCII characters.

Solution

If you need to use Asian fonts, you should not deselect the Additional Asian Fonts package in the Mac OS X Installer. While these fonts are not globally required, certain applications may be programmed to use those specific fonts.

Also, always use the second CD during installation if and when prompted. Do not quit the Installer after the first CD is completed. This should be done whether or not you use Asian fonts.

To install the fonts and resolve the issue, follow these steps:

1. Insert the second Mac OS X Installation CD.
2. Double-click the Additional Asian Fonts package.
3. Enter the Admin user password.
4. Click Continue.
5. Select a destination disk.
6. Click Continue.
7. Click Install.

Published Date: Oct 11, 2016

Mac OS X 10.2: Cannot Print After Installing Deskjet 2.0 Drivers

The application from which you try to print quits unexpectedly after installing Hewlett Packard Deskjet 2.0 printer drivers.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to print from an application, the application quits unexpectedly.

Note: It is possible that other HP printer models may be affected when using this software.

Solution

1. Click the Finder icon in the Dock.
2. Choose Applications from the Go menu.
3. Open the Utilities folder.
4. Open Printer Center.
5. Select the affected printer in the Printer List.
6. Click Delete.
7. Click Add.
8. Choose USB in the upper pop-up menu of the sheet that appears.
9. Select the HP printer in the list below.
10. Click Add.
11. Choose Quit from the Print Center menu.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X: No Idle Sleep When File Sharing Is On

When file sharing is on, the computer does not go to sleep after the period of inactivity defined in the Energy Saver pane of System Preferences
This article has been archived and is no longer updated by Apple.

Symptom

The computer does not go to sleep when idle.

Note: The affected Apple file service may be called "File Sharing" or "Personal File Sharing", depending on the version of Mac OS X installed. This does not refer to other sharing services offered by Mac OS X, such as Web Sharing, Windows File Sharing, or FTP.

Solution

The computer will only idle to sleep when file sharing is off. When file sharing is on, you may force the computer to sleep by choosing Sleep from the Apple menu.

File sharing is turned on or off in the Sharing pane of System Preferences.

You may avoid the issue by updating to Mac OS X 10.2.3 or later. See technical document 107263, "**Mac OS X: About the Mac OS X 10.2.3 Update**".

Published Date: Feb 17, 2012

Mac OS X 10.2: How to Change the Spell Check Language Dictionary

This document explains how to change the language dictionary used by the Mac OS X spell check feature.
This article has been archived and is no longer updated by Apple.
Note: Not all applications use the Mac OS X spelling dictionaries to which this document refers. Some third-party applications use their own dictionaries, and you should see third-party documentation for questions about them. Applications that use the Mac OS X spelling dictionaries have Spelling submenu choices in the Edit menu.

To change the language dictionary used by the spell check feature:

1. Open an application that uses a built-in dictionary. Mail is an example.
2. Choose Spelling from the Edit menu, and Spelling from the submenu.
3. In the Spelling dialog box, select the desired dictionary language from the pop-up menu.
4. Close the window.

Note: You must repeat these steps for other applications that use the built-in dictionaries.
Published Date: Feb 17, 2012

Mac OS X 10.2 or Later: Printers That Work With Printer Sharing

This document describes which printers work with Printer Sharing in Mac OS X 10.2 or later.
This article has been archived and is no longer updated by Apple.
Note: This document describes only the "Printer Sharing" feature located in the Sharing preference pane, not to the additional "Print Service" included with Mac OS X Server.

Any printer you add in Print Center can be shared with other Mac OS X 10.2 computers, whether or not printer drivers are included with Mac OS X 10.2. This includes both PostScript and non-PostScript printers that connect via:

- USB
- Ethernet
- 802.11b wireless (such as AirPort)
- FireWire

For a list of printers that work with Mac OS X, see the printers section of the Mac OS X website (http://docs.info.apple.com/article.html?artnum=86054).

iChat: "Disk in use" Alert After Sending a File, Difficulty Ejecting Disk

You may not be able to eject (or unmount) a volume--a disk or partition--after sending a file in iChat.

This article has been archived and is no longer updated by Apple.

Symptom

When you try to eject a disk, an alert box with this message appears :

> "The operation could not be completed because the disk (disk name) is in use."

After this occurs, you cannot eject the volume as you normally would.

Solution

This occurs after sending another iChat user a file stored on a volume other than the startup disk. To prevent the issue, copy the file to the Mac OS X startup disk before sending the file with iChat.

This document will be updated when more information is available.

Published Date: Feb 17, 2012

Mac OS X 10.1: Entourage Email Messages Lost After Force Restart of Computer

You could encounter a situation in which Entourage email messages are lost in Mac OS X 10.1 after a force restart. Mac OS X 10.2 includes new features to guard against data loss in some situations where applications may fail or after a force restart.
This article has been archived and is no longer updated by Apple.

Symptom

After either a force restart of your computer or a kernel panic, you may see that:

- Email messages are missing from Entourage.
- Other data, such as contacts, are missing.
- The email database file has been reduced to 4096 bytes.

Solution

This specific set of symptoms does not occur in Mac OS X 10.2 or later. In Mac OS X 10.1 to 10.1.5, the issue can occur if Entourage is open at the time of a forced restart. The file system may then record an invalid size for the Entourage database, effectively abbreviating the file. These are example scenarios:

- The computer experiences a kernel panic while you are using Entourage, and you must force restart the computer.
- Entourage becomes unresponsive, displaying the spinning disc pointer, and you follow up by force restarting the computer.
- You force restart the computer after it will not wake from sleep, and Entourage had been open before sleep.
- The computer experiences a power loss while using Entourage, or is force restarted for another reason.

Notes

1. New features in Mac OS X 10.2 prevent the specific set of symptoms described above, as characterized by the reduction of the mail database to 4096 bytes. Typical data loss, such as loss of unsaved changes to a single document during a force restart, may still occur in any application. Minimize this type of loss by saving your work often.

2. Mac OS X 10.2 or later resolves the potential data loss issue. You should always update to the latest version of Mac OS X for the best Entourage performance. See technical document 106704, "**Mac OS X: How to Update Your Software**".

3. For help identifying a kernel panic, see technical document 106227, "**Mac OS X: What is a Kernel Panic?**"

Mac OS X Managed Client: How the Preference Model Works for Managed Mac OS X Clients

This article has been archived and is no longer updated by Apple.
<>With Mac OS X Server 10.2 or later, you can use the Workgroup Manager application to set preference settings and restrictions for managed Mac OS X 10.2 or later computers. This document provides a brief overview of how the settings work.

In order for Mac OS X Server 10.2 or later to properly manage Mac OS 10.2 client computers, you must set up computer accounts to be managed. This is done in the Accounts area of Workgroup Manager, in the Computers sub-pane. Refer to the Server Admin Guide for complete instructions on setup.

In a situation where settings are managed by Workgroup Manager, the order in which managed settings override other managed settings is:

- Users override Computers, and
- Computers override Workgroups

All managed preferences override a user's personal settings (or the computer's default settings).

If you do not manage a particular preference, the basic user and system preferences are used. For example, if you do not set any managed preferences for Dock placement, then the Dock will use the default location at the bottom of the screen.

In a common setup, most preferences should be set up in Workgroups. Only exceptional cases should be stored in Computers or Users. An example setting would be to set application access to Workgroups, and only set a Printing setting for the Computers.

Preferences can be "Never", "Once", or "Always". Never really means "Don't Manage". In an override calculation a Never is just skipped (ignored) for the calculation.

When you override preferences, the Once or Always setting will be overridden by a higher authority.

For example, suppose Dock Settings is set to display on Left and is Always for a workgroup. But suppose the user is set for Once. The user gets the Once settings (where they can change the settings).

Certain preferences are combined. In 10.2 or later these are:

- Dock Items
- Login Items
- Printers
- Application Items

For combined preferences, the user gets the combination of the managed settings for the Workgroup, Computer, and User. Always settings are available to the user but may not be changed. Once settings are combined with the user's personal settings and may be changed by the user.

Note that both Dock Items and Login Items contain checkboxes that allow Always settings and the user's personal preferences to be displayed at the same time.

Mac OS X: About the Network Icon in the Finder

This document describes what the Network icon in the Finder is for.
This article has been archived and is no longer updated by Apple.
You see the Network icon by clicking the Computer button in the Finder toolbar, or by choosing Computer from the Go menu.

When your computer is set up to bind to a managed network, such as NetInfo, you can browse the network using the Network icon as if it were a hard disk or CD.

Using the Finder, Network resources appear like those on your hard disk, such as /Library and /System. These network resources can be used by any user who has access to them.

For more information on NetInfo, see the whitepaper, "Understanding and Using NetInfo" (**http://manuals.info.apple.com/Apple_Support_Area/Manuals/software/UnderstandingUsingNetInfo.PDF**).
Published Date: Feb 17, 2012

AirPort 2.0.4: Maximum Connection Speed for Incoming Dial-up to AirPort Base Station

If you make a dial-up modem connection to an AirPort Base Station that uses 2.0.4 or later software, you may get a maximum connection speed of 33.6 kilobits per second (Kbps).
This article has been archived and is no longer updated by Apple.
AirPort software version 2.0.4 and later allows an AirPort Base Station to accept incoming dial-up, PPP connections. This allows remote access to the base station and the computers on the AirPort wireless and wired network.

If you connect to the base station from a V.90 modem, the best speed you can expect is a V.34 speed of 33.6 Kbps. This is a limitation of the V.90 standard and does not indicate any issue with your modem or base station. Although the V.90 protocol allows connection speeds of up to 56 Kbps, this maximum speed cannot be achieved between two consumer-grade modems. Specialized equipment, typically owned by Internet service providers, is required at the receiving end to enable maximum speed.

Note: The incoming connection feature can be activated only from Mac OS X computers. Only the AirPort Base Station (Dual Ethernet) can accept incoming calls.
Published Date: Feb 19, 2012

AirPort 2.0.4: How to Administer an AirPort Base Station via a Dial-Up Connection (PPP Dial-In)

With AirPort 2.0.4 or later software and an AirPort Base Station (Dual Ethernet or Extreme), you have the ability to administer the base station over a dial-up connection. This document describes features and setup.
This article has been archived and is no longer updated by Apple.
An AirPort Base Station (Dual Ethernet or Extreme) with AirPort 2.0.4 or later software can accept an incoming dial-up (PPP) connection. This feature is referred to alternatively as "remote access", "PPP Server" and "PPP Dial-in".

The person dialing up can connect to the base station and access:

- The base station itself, via AirPort Admin Utility
- Other computers or devices connected via the LAN port
- Computers connected wirelessly to the base station
- Network or Internet services on the WAN port (Note 1)

Follow these steps to enable this feature:

1. Connect to the base station via AirPort Admin Utility.
2. Click the Network tab.
3. Select the checkbox for "Allow remote access."
4. Click Configure.

After you click Configure, you can set:

- The user name and password of the PPP dial-up user. See Note 2.
- Answer on ring - the number of rings before the base station answers the telephone line. The default is 3.
- Disconnect if idle - the elapsed time of inactivity at which the base station disconnects the PPP user. The default setting is Never.
- Force disconnect after - The elapsed time at which the base station disconnects the PPP user, regardless of activity. This is a useful feature if you want to control the user's session length. The default setting is Never.

Notes

1. Since the base station only has one modem, you cannot be connected to it via dial-up and access any dial-up Internet services at the same time.

2. If you try to update the base station after selecting remote access but without setting a user name, an alert box with this message will appear, "PPP Dial-in requires a user name." Additionally, you cannot update the base station for remote access until you have completed the Password and Verify fields.

3. The AirPort menu on associated clients will contain a new status indication of "PPP Dial-in: Not connected" or "PPP Dial-in: Connected".

4. This feature cannot be used when the base station is configured to connect to the Internet via the modem, AOL, or PPPoE broadband.

5. Only one user name and password can be configured.

6. NAT and DHCP must to be turned on for this feature to work.

7. The IP address of the PPP client cannot be configured manually.

8. The PPP client will have a 255.255.255.255 subnet mask when connected to the base station.

9. AppleTalk and other non-IP protocols are not available over the PPP connection.

10. Another base station cannot be used to dial up a base station with this feature enabled.

11. The maximum connection speed is 33.6 Kbps.

12. Mac OS X Internet Connect will not report max time remaining correctly. This does not occur in Mac OS 9 with Apple Remote Access.

13. When administering the base station via the PPP dial-up connection, you will be disconnected when the base station restarts. This is a

normal part of updating the base station's settings.

Published Date: Oct 11, 2016

Airport 2.0.4: How to Disable SNMP Access to an Airport Base Station (Dual Ethernet)

This document explains how to disable SNMP access to an AirPort Base Station (Dual Ethernet). You can use this feature to protect your network from SNMP denial-of-service attacks.
This article has been archived and is no longer updated by Apple.
Networks managed by Simple Network Management Protocol (SNMP) have a potential vulnerability to malicious attacks, such as denial of service.

SNMP is a network management protocol that is enabled by default in the AirPort Admin Utility. AirPort Admin Utility 2.0.4 or later allows you to disable SNMP on your wide area network (WAN). To disable SNMP, follow these steps:

1. Connect to the base station via AirPort Admin Utility.
2. Click the AirPort tab.
3. Deselect the checkbox for "Enable SNMP access on WAN."
4. Update the base station.

Note: SNMP cannot be disabled on the original AirPort Base Station (Graphite).
Published Date: Feb 19, 2012

AirPort 2.0.4: How to Use a RADIUS Server on a Wireless Network

The AirPort Base Station (Dual Ethernet) can be configured to connect to a RADIUS server to authenticate access to your wireless network.
This article has been archived and is no longer updated by Apple.
RADIUS (Remote Authentication Dial-In User Service) is a client-server protocol for centralized user authentication, profiles, and network statistics. A RADIUS server may also store your hardware Access Control List so that it is not necessary to enter it for each base station on your network. If you have set up a RADIUS server on your network, you may configure the AirPort Base Station (Dual Ethernet) to use it. To do this:

1. Connect to the base station via AirPort Admin Utility.
2. Click the Authentication tab.
3. Select the "Use RADIUS Authentication checkbox."
4. Enter the IP address, port number, and shared secret for the servers.
5. Update the base station.

Notes

1. The base station will look first to its local Access Control List. If the MAC address is there, the client can join the network. If the MAC address is not in the local Access Control List, the base station checks the RADIUS server for the MAC address. If it is there, the user can join the network.

2. The AirPort Base Station (Graphite) does not offer RADIUS authentication. It is a feature included with AirPort 2.0.4 or later.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.
Published Date: Feb 19, 2012

Airport 2.0.4: About Using Cisco RADIUS Servers

AirPort 2.0.4 or later software works with the Cisco NAS (Network Authentication Service) identifier for Cisco RADIUS servers.
This article has been archived and is no longer updated by Apple.
The RADIUS pop-up menu includes Default and Alternate choices because some servers use a different method of authentication. The three choices in the RADIUS pop-up menu have the following effects:

- Not used
  RADIUS will not be active on the base station.
- Default
  The MAC address will be formatted as 010203-0a0b0c and used for the user name. The Shared Secret will be the password. This format is often used by Lucent- and Agere-branded RADIUS servers.
- Alternate
  The MAC address will be formatted as 0102030a0b0c and used for both the user name and password. This format is often used by Cisco RADIUS servers.

Earlier versions of base station firmware only provided the Default format for RADIUS servers.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

AirPort 2.0.4: About Using AirPort With Point to Point Tunneling Protocol (PPTP)

AirPort 2.0.4 or later software, combined with the AirPort Base Station (Dual Ethernet), is compatible with PPTP clients.
This article has been archived and is no longer updated by Apple.
AirPort 2.0.4 or later is compatible with Microsoft Windows clients that use PPTP (Point to Point Tunneling Protocol) style VPN (Virtual Private Network). It is also compatible with IPsec (IP security protocol) without authenticated headers.

Multiple PPTP (Microsoft-style VPN) sessions can work through the AirPort Base Station (Dual Ethernet) simultaneously.
Published Date: Feb 19, 2012

AirPort: Cannot Connect More Than One User to a Port-Mapped Service

Updating to AirPort 2.0.4 or later resolves an issue in which only one user can connect to a port-mapped service.
This article has been archived and is no longer updated by Apple.

Symptom

Only one user can connect to a port-mapped service. A different user cannot connect until the base station has been restarted.

Solution

Update to AirPort software 2.0.4 or later, which allows multiple users to connect to port-mapped services.

With AirPort 2.0.2 software and base station firmware (4.0 and 4.02 only), only one external connection could be made to a mapped port, even though the application serving on that port may have been designed to handle multiple connections. If the single user disconnects, a different user cannot connect until after you restart the AirPort Base Station.

Published Date: Feb 19, 2012

AirPort 2.0.4: About Using Link-Local Addressing

Link-Local addressing is a protocol by which computers or other devices on a network, such as the AirPort Base Station, can self-assign IP addresses that are valid for their local network but not globally routable.
This article has been archived and is no longer updated by Apple.
Link-Local addressing is a protocol by which computers or other devices on a network, such as the AirPort Base Station, can self-assign IP addresses that are valid for their local network but not globally routable. Link-Local addresses are all in the 169.254/16 network. Recent versions of Mac OS and Microsoft Windows configured to get an address via DHCP will resort to choosing a Link-Local IP address if no DHCP server responds to their queries.

When a DHCP server is not present, an AirPort Base Station (Dual-Ethernet) with 4.0.4 or later firmware will self-assign a unique 169.254.x.x address (where "x" may be any number from 1 to 255). Link-Local addressing guarantees that you can always find the base station on a known subnet. This means that scans made by AirPort Admin Utility will be more reliable. With earlier base station firmware versions, a base station that could not get an IP address defaulted to an Apple-reserved address of 192.42.249.13 or 192.42.249.12. In some cases it was difficult to connect to such a base station.

This type of addressing is also a useful feature when connecting to a base station that has been "hard" reset. The default IP address of a hard-reset base station is:

LAN Port: 10.0.1.1
WAN Port: 169.254.x.x
Published Date: Feb 19, 2012

AirPort 2.1: Scrolling AirPort Messages in Menu Bar

In Mac OS X 10.2 or later, the AirPort menu bar item displays animated, scrolling status messages for PPP and network status.
This article has been archived and is no longer updated by Apple.
In Mac OS X 10.2 or later, the AirPort menu bar item can slide to the side and display a scrolling text message that reflects your network status, such as "Waiting for modem reset." The status information is essentially the same that appears in the Internet Connect application or the Internal Modem menu bar item. Information is displayed for PPP, PPPoE, and AirPort network status. After restart, waking from sleep, or connecting to a new network, the menu bar item briefly scrolls a message to tell you which network it has joined.
Published Date: Feb 19, 2012

AirPort 2.1: How to Use AOL Parental Controls on the Base Station

Mac OS X 10.2 introduced AirPort software with the ability to implement AOL Parental Controls via the AirPort Base Station.
This article has been archived and is no longer updated by Apple.
To use the parental controls you have previously set up with your America Online (AOL) account, follow these steps:

1. Connect to the base station with the AirPort Admin Utility.
2. Click the Network tab.
3. Select the checkbox for "Enable AOL parental controls."
4. Click Update. The parental controls are copied to the base station.

Note: You must have previously set up parental controls in AOL software. Otherwise, this will only limit broadband access and require authentication via AOL. This is described further below.

Broadband Access Blocked when Parental Controls Enabled

The AirPort AOL Parental Control feature is meant to block availability to other broadband features. Access to the Internet is controlled by authentication in the AOL client software. When this feature is enabled, all users must use an AOL client to authenticate their connection to AOL before any other broadband access will be available.

Defining the Level of Parental Control

When using AOL to control access, the level of parental control must be defined in the AOL Parental Control setup. To activate the AOL parental control feature, you must set up those controls in AOL. The Apple feature simply enables the controls for that individual user logged on to an AOL account through the base station.

You can use the AOL Parental Controls feature to control or limit access to the following:

- connection time
- access level
- instant message notes
- email control
- AOL chat
- downloads from AOL software library or other FTP sites
- newsgroups and other AOL premium services

To learn more, use the AOL keyword "Parental Controls", or click on the link from the main AOL window.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Mac OS X 10.2: Some Users Cannot Fax With FAXstf X

With Mac OS X 10.2, the first user to set up FAXstf X will add a FAXstf queue in Print Center. This queue will be visible to other users on the computer, but they will not be able to use the queue to send faxes.
This article has been archived and is no longer updated by Apple.

Symptom

When a user other than the one who originally set up FAXstf X attempts to send a fax, Print Center opens but then immediately quits without sending the fax.

Solution

Update to FAXsft X version 10.1.3 or later. The software may be available from the SmithMicro Software File Library (http://www.smithmicro.com/support/files.tpl) .

Mac OS X 10.2: Repair Disk Permissions Finds Issue With /private/var/run/utmp

Disk Utility may erroneously report an issue with /private/var/run/utmp.
This article has been archived and is no longer updated by Apple.

Symptom

Disk Utility reports:

> "Group differs on ./private/var/run/utmp, should be 0, group is 1"

Solution

The message is not accurate and is not a cause for concern.
Published Date: Oct 11, 2016

AppleWorks 5: Spreadsheet Auto Recalculation May Require "Calculate Now"

Spreadsheet documents created with AppleWorks versions 5.0 through 5.0.4 may not auto recalculate formulas when used in any version of AppleWorks 5.0 or later.

This article has been archived and is no longer updated by Apple.

Symptom

An AppleWorks spreadsheet can automatically recalculate formulas when data changes. To do this, you use references (addresses) of other cells in a formula. When you change the data in a referenced cell, AppleWorks automatically recalculates the formula using the new data. Spreadsheet documents created using AppleWorks 5 may not automatically recalculate the formula, requiring users to choose the Calculate Now menu command. If the document is opened in either AppleWorks 5 or 6, the issue persists in both Macintosh and Windows versions.

Solution

This issue does not occur with AppleWorks spreadsheet documents created in AppleWorks 5.0 or later for Windows. Choosing Calculate Now forces a recalculation, and updates the appropriate cell(s) in AppleWorks 5 spreadsheets. To prevent this issue from occurring in the future, AppleWorks 5 spreadsheets can be updated to AppleWorks 6.0 or later. To update the spreadsheet, use the following steps to copy data into a new AppleWorks 6 spreadsheet:

1. Open the affected spreadsheet in AppleWorks 6.0 or later.
2. Choose Select All from the Edit menu.
3. Choose Copy from the Edit menu.
4. Choose New from the File menu, then Spreadsheet from the submenu.
5. Choose Paste from the Edit menu.
6. Save the new spreadsheet as an AppleWorks 6 document.

For more information about AppleWorks, please visit its product page (http://www.apple.com/appleworks) or search the Knowledge Base.

Published Date: Feb 17, 2012

Workgroup Manager: Automounted Share Points Should Not Be Created in the NetInfo/DefaultLocalNode Domain

When creating share points with Workgroup Manager, selecting the domain NetInfo/DefaultLocalNode will create a local-only automount point that will not be used by client computers.

This article has been archived and is no longer updated by Apple.

Symptom

Automounted share points created with Workgroup Manager do not appear on client computers as expected.

Solution

When selecting a domain for "Automount this item to clients in domain", you should always select a network-visible domain such as the NetInfo/root domain. The NetInfo network domains are searched by clients that are configured to access them via Directory Services. If you do not have any network NetInfo domains, only the NetInfo/DefaultLocalNode will be available in the pop-up list. The NetInfo/DefaultLocalNode is only used by the local system. It will not be accessed for automount share points by other client systems.

You may resolve the issue by following these steps:

1. Using WorkGroup Manager, connect to the server on which you created the share point.
2. Click the Sharing icon in the tool box.
3. Select the affected share point.
4. Click the Automount tab.
5. In the domain selection pop-up menu, change the domain from NetInfo/DefaultLocalNode to NetInfo/root (or other higher level domain if you have one). You will be asked to provide a login name and password for an administrator of this domain.
6. Click Save.

The automounted share point will now be moved to the selected NetInfo domain. It will be used by the NetInfo clients configured to use this directory service.

For more information on NetInfo and Directory Services, see the Mac OS X Server 10.2 Admin Guide installed on your computer at:

/Library/Documentation/MacOSXServer/English/Admin Guide.pdf

Mac OS X Server: Using non-Postscript printers with the Print Server

This article has been archived and is no longer updated by Apple.

The Print Service in Mac OS X Server is designed to share Postscript printers, but it can also share non-Postscript printers with some caveats. A printer's physical connection does not indicate whether or not it uses PostScript--check your printer's specifications.

Mac OS X Server 10.3, 10.4 or later

Mac OS X Server 10.3 and 10.4 use PostScript print queues to provide printer sharing (or spooling) of both Postscript and non-Postscript printers. Clients can print to these queues using AppleTalk PAP, LPR/LPD, or SMB/CIFS protocols.

When Mac OS X Server 10.3 or later receives the print job, it either queues the PostScript print job for delivery to a networked or USB PostScript printer, or converts the PostScript print job into PDF (using the ps2pdf converter) for output to a inkjet (raster) printer connected to the server using USB.

Note: With Mac OS X Server 10.4 or later, IPP-shared queues allow direct spooling of PDF to the server, eliminating the need for Postscript conversion.

Since only PostScript print jobs can be received, clients must use a Postscript PPD to print to the server queue. If the queue is serving a non-Postrscript printer, clients must use the Generic PPD. In this case, driver specific features, such as checking the amount of ink available in the printer, are not available.

For more information about the Print Server, see the Mac OS X Server Print Service Administration Guide (manual).

Mac OS X Server 10.2

To share a printer using Print Server, you must use a PostScript printer connected via USB or Ethernet.

However, you can share non-PostScript printers using the Printer Sharing feature in Sharing preferences. It will appear as a queue in the Server Settings Print Monitor, but you will notice that the Edit button is dimmed. This means that you can monitor what the printer is doing, but you cannot limit access to it, or give it a new queue name, and so forth. If it is a PostScript printer, the Edit button will be available. You will be able to share the printer using Print Service and apply other Print Service options. Printers shared using Mac OS X Server Print Service do not automatically appear in the Printer List in Print Center (Mac OS X 10.2 or later clients) and must be specifically added by the user.

Note: Do not use Printer Sharing (in the Sharing preference pane) if you want to enforce print quotas. Printer Sharing enables clients to use all shared printers and print queues without regard to quotas you may have specified.

For information on setting up Printer Sharing, see Mac Help.

Mac OS X: Maximum Number of File Sharing Connections

Mac OS X, like previous versions of Mac OS, has a Personal File Sharing limit of 10 simultaneously connected users. This service is referred to simply as File Sharing in some versions of Mac OS X.

This article has been archived and is no longer updated by Apple.

In Mac OS X version 10.0 or later, Personal File Sharing is designed to serve a maximum of 10 users. If you need to connect more users at once, you should upgrade to Unlimited-Client version of Mac OS X Server (http://www.apple.com/server/).

Published Date: Feb 17, 2012

Mac OS X Managed Client: Blank Passwords Do Not Work

Managed client users must have a password set. Blank passwords do not work with managed clients.
This article has been archived and is no longer updated by Apple.

Symptom

When a user with a blank password attempts to log in, his home directory does not appear. (It does not become available automatically.)

Solution

Be sure to set a password for all users who are members of managed workgroups.

Published Date: Oct 11, 2016

Mac OS X Server: How to Get More Than 500 Returns From LDAP Server

You can configure the Open Directory LDAP Server to return more than 500 records in a single search result.
This article has been archived and is no longer updated by Apple.
By default, the server returns a maximum of 500 records per search. To increase this limit, you must edit the file /etc/openldap/slapd.conf while logged in as the root user. These steps describe one way to do this:

1. Log in to the server as root. If you need help with this step, see technical document 106290, "**Mac OS X: About the root User and How to Enable It**"
2. Open TextEdit.
3. Click the Finder icon in the Dock.
4. Choose Go to Folder from the Go menu. A sheet appears.
5. Type: /etc/openldap/
6. Click Go.
7. Locate the file named: slapd.conf
8. Drag this file onto the TextEdit icon in the Dock.
9. Add this line to the end of the file:

   sizelimit <max number>

   For example, to allow a maximum of 15000 records, enter:

   sizelimit 15000

10. Save the file.
11. Quit TextEdit.
12. Log out.

This should allow you to increase the number of records returned. If it does not, follow these steps:

1. Drag the slapd.conf file to the Trash.
2. Make a copy of: slapd.conf.default
3. Rename the copy to: slapd.conf
4. Repeat the steps above, being sure to make no other changes to the file.

Type the command "man slapd.conf" in Terminal for more information on the slapd.conf file.

Mac OS X: Modem "Sticks" or "Hangs" When Using Certain Norton Software

After installing Norton Firewall 2.0 or Norton Internet Security 2.0 (which includes Norton Firewall 2.0), your modem may not disconnect properly.

This article has been archived and is no longer updated by Apple.

Symptom

After clicking the Disconnect button for your internal modem, the modem "sticks" or "hangs" at a status of "disconnecting."

Solution

Update to Norton Firewall v2.0.1 or later. The Symantec support site documents this issue at:

http://service1.symantec.com/SUPPORT/num.nsf/docid/2002062811092211

Mac OS X Server: How to Use createhomedir Command to Create Home Directories

This document explains how to use the createhomedir command-line tool to create home directories.
This article has been archived and is no longer updated by Apple.
You can use the createhomedir command-line tool to create home directories for one or more users on the server on which you use the tool. Here are the parameters that createhomedir accepts. Parameters are delimited using angle brackets (<>) if they are required, and square brackets ([]) if they are optional:

```
createhomedir <-a or -l or -n directoryDomainName> [-u userName]
```

The flags have these effects:

```
-a
```

Creates home directories for users defined in all directory domains of the server's search path.

```
-l
```

Creates home directories for users defined in the local directory domain.

```
-n directoryDomainName
```

Creates home directories for users defined in a specific directory domain in the server's search path.

```
-u userName
```

Creates a home directory for a specific user defined in the domain(s) identified in the -a, -l, or -n parameter. The userName value must be a short name assigned to the user. If you omit the -a, -l, and -n parameters when you use the -u parameter, -a is assumed.

To use createhomedir to create home directories:

1. Log in to the server on which you want the home directories to reside.
2. Open the Terminal application.
3. At the prompt, type :sudo -s
4. Press Return.
5. Enter your Admin user password when prompted, and press Return.
6. You may then use the createhomedir command with the syntax described above. The createhomedir tool is located at: /usr/sbin

The following examples creates a home directory for a user with the short name "ichiro" who has an account in the shared directory domain "/NetInfo/root":

```
createhomedir -n /NetInfo/root -u ichiro
```

This command creates Home directories for all users defined in all directory domains of the server's search path if they do not already exist:

```
createhomedir -a
```

Note: Apple does not offer free telephone support for the use of this command line tool.

Mac OS X Server 10.2: How to Configure WebMail to Enable Searching

This document describes how to set up WebMail to enable searching.
This article has been archived and is no longer updated by Apple.
This applies to SquirrelMail 1.2.7 as installed with Mac OS X Server 10.2 and 10.2.1, and to SquirrelMail 1.2.8 as installed in Mac OS X Server 10.2.2.

If you have enabled WebMail, are using it to access mail from Apple Mail Server, and have found that the WebMail search function fails to find email messages that it should, there is a simple configuration change you can make to fix the issue.

If you have not made any changes to the SquirrelMail configuration file since installing Mac OS X Server 10.2 (either via running the /etc/squirrelmail/config/conf.pl script or by editing the config file /etc/squirrelmail/config/config.php), you can simply replace the old config with the new one by typing these two commands from the Terminal application:

```
#sudo mv /etc/squirrelmail/config/config.php /etc/squirrelmail/config/config.php.old
```

```
#sudo cp /etc/squirrelmail/config/config_default_apple.php /etc/squirrelmail/config/config.php
```

If you have made changes to the squirrelmail config file since installing Mac OS X Server 10.2, you can edit the /etc/squirrelmail/config/config.php config file and make a simple change. Using your preferred text editor as root, find the line in /etc/squirrelmail/config/config.php that reads:

```
$imap_server_type = "other";
```

Change it to:

```
$imap_server_type = "macosx";
```

Save the file.

You can also use the command-line tool to update the configuration:

```
sudo /etc/squirrelmail/config/conf.pl
```

You may also need to use a text editor to fix up /etc/squirrelmail/config/config.php after saving the configuration change. Refer to the help item entitled "New: Configuring WebMail" for important information about running the interactive conf.pl script to configure WebMail. (When reading that help item, note that the paths that read "/etc/squirrelmail/conf/..." are incorrect; they should read "/etc/squirrelmail/config/...)
Published Date: Oct 11, 2016

Mac OS X 10.2: Unable to Drag Icons or Use Drag-and-Drop Feature

This document discusses address an issue in which you cannot drag items in the Finder, or in another application that uses drag and drop.
This article has been archived and is no longer updated by Apple.

Symptom

You cannot use the drag-and-drop feature of the Finder or another application; you cannot drag items within Finder windows or the desktop.

Solution

Restart the computer.

Note: Update to Mac OS X 10.2.2 or later for improved reliability.

Published Date: Oct 11, 2016

Mac OS X Server 10.2: How To Journal a Volume or Repair a Journaled Volume

Mac OS X Server 10.2.2 introduces a file system feature known as journaling. This feature helps protect the file system against unforeseen failures in server components or power outages, reducing the need for repairs. You may journal a volume or disable journaling using either Disk Utility or command-line tools.
This article has been archived and is no longer updated by Apple.
Note: If you need a general description of what journaling is, see technical document 107249, "**Mac OS X: About File System Journaling**".

Using Disk Utility

Using Disk Utility, you may journal a volume with or without erasing it.

To journal a volume without erasing it:

1. Log in as an Admin user to the server whose volume you want to set up for journaling.
2. Make sure that no one is using the server.
3. Open Disk Utility (/Applications/Utilities/).
4. Select the disk you want to work with in the column on the left.
5. Click the First Aid tab.
6. Click Verify Disk to make sure it is free from errors before conducting step 6.
7. Click the Information tab.
8. Click Make Journaled.

To journal a volume while erasing it:

Important: Make sure that you back up all important data on the volume before erasing the it. All data not backed up will be lost after this procedure.

1. Log in as an Admin user to the server whose volume you want to set up for journaling.
2. Make sure that no one is using the server.
3. Open Disk Utility (/Applications/Utilities/).
4. Select the disk you want to work with in the column on the left.
5. Click the Erase tab.
6. Choose "Mac OS Extended (Journaled)" from the pop-up menu.
7. Type a name for the disk in the Name field.
8. Click Erase.

To disable journaling:

You can use the Disk Utility application to disable journaling.

1. Log in as an Admin user to the server whose volume you want to set up for journaling.
2. Make sure that no one is using the server.
3. Open Disk Utility (/Applications/Utilities/).
4. Select the disk you want to work with in the column on the left.
5. Click the Information tab.
6. Click Remove Journaling.

Repairing the journaled volume:

You may use Disk Utility to verify or repair a journaled volume as with any other compatible volume.

Using command-line tools

At the command line, you journal a volume with or without erasing it, as noted in Step 5. This choice decides whether you use the diskutil or new_hfs command.

1. Log in as an Admin user to the server whose volume you want to set up for journaling.

2. Make sure that no one is using the server.

3. Open Terminal (/Applications/Utilities/).

4. Type: `mount`

5. Press Return. A list of volumes that are available to the file system appears. Look for the volume that is at the root level "/". This is the server's startup volume, for example: "`/dev/disk0s11`".

6. Run fsck_hfs with the -f and -n flags to make sure the disk is free from errors. For example, to verify /dev/disk0s11, you would execute:

```
sudo fsck_hfs -f -n /dev/disk0s11
```

7. If you want to convert a disk to a journaled volume without erasing it, continue to Step 8. If you want to erase the volume and then format it with journaling, skip to Step 9.

8. Run diskutil using the enableJournal option, and identify the volume you want to convert. To enable journaling for the root volume, for example, you would execute:

```
sudo /usr/sbin/diskutil enableJournal /
```

To enable journaling for a volume called MyDisk, you would execute:

```
sudo /usr/sbin/diskutil enableJournal /Volumes/MyDisk
```

Stop here. Do **not** continue to Step 9.

9. Make sure that you back up all important data on the volume before erasing the disk. All data not backed up will be lost in this step. Use the -J flag with newfs_hfs. For example, to make a journaled volume named "Foo" on device /dev/disk0s11, you would execute:

```
newfs_hfs -J -v Foo /dev/disk0s11
```

Disabling journaling via diskutil

You can disable journaling from the Terminal application by using diskutil. Follow these steps:

1. Log in as an Admin user to the server whose disk you want to set up for journaling.
2. Make sure that no one is using the server.
3. Open Terminal (/Applications/Utilities/).
4. Execute the diskutil command, using the disableJournal option and identifying the volume for which you want journaling disabled. To disable journaling for the root volume, for example, you would execute:

```
sudo /usr/sbin/diskutil disableJournal /
```

To disable journaling for a volume called MyDisk, you would execute:

```
sudo /usr/sbin/diskutil disableJournal /Volumes/MyDisk
```

Repairing a journaled volume

You can check and repair a journaled volume using fsck_hfs from the command line. To repair a journaled disk:

1. Log in as an Admin user to the server whose disk you want to set up for journaling.
2. Make sure that no one is using the server.
3. Open Terminal (/Applications/Utilities/).
4. Execute the fsck_hfs command using the -f flag. For example, to force checking a journaled volume on device /dev/disk0s11, execute:

```
fsck_hfs -f /dev/disk0s11
```

Mac OS X 10.2: Computer Starts up to Login Window After Upgrade from 10.1

If you choose the Archive and Install option when upgrading from Mac OS X 10.1 to Mac OS X 10.2, the preference to automatically log in at startup is not retained.
This article has been archived and is no longer updated by Apple.

Symptom

After upgrading from Mac OS X 10.1 to Mac OS X 10.2, the computer starts up to the Login Window, even though the option to automatically log in as a specific user was selected in Mac OS X 10.1.

Solution

Mac OS X 10.2.2 and later:

1. Open System Preferences.
2. Choose Accounts from the View menu.
3. If necessary, click the lock button to make changes.
4. Select "Login automatically as" to enable that option.

Mac OS X 10.2 to 10.2.1:

1. Open System Preferences.
2. Choose Accounts from the View menu.
3. If necessary, click the lock button to make changes.
4. Deselect the "Login automatically as" option. (It will already be selected.)
5. Quit System Preferences.
6. Reopen System Preferences, and go back to the Accounts pane.
7. Select the option to "Login automatically as".

Published Date: Feb 17, 2012

Mac OS X Server 10.2.2: Disk Quotas and Journaling Not Compatible With Each Other

You should not use the disk quotas feature in conjunction with the journaling feature in Mac OS X Server 10.2.2. Update to version 10.2.3 or later to use them together.
This article has been archived and is no longer updated by Apple.
Note: Journaling is a feature of Mac OS X Server 10.2.2 or later. For a general description journaling, see technical document 107249, "**Mac OS X Server 10.2: About File System Journaling**".

To use disk quotas in conjunction with journaling, update to Mac OS X Server 10.2.3 or later. See technical document 107265, "**Mac OS X Server: About the Mac OS X Server 10.2.3 Update**".

If you cannot update immediately, this information applies to Mac OS X Server 10.2.2:

If journaling is turned on on a shared volume, use the Workgroup Manager sharing module to turn quotas off for that volume. Follow these steps:

1. Open Workgroup Manager, and connect to the server.
2. Click the Sharing Module icon.
3. Select the volume from the All view.
4. Click the General tab.
5. Be sure the "enable disk quotas on this volume" checkbox is **not** selected.

Published Date: Oct 11, 2016

Mac OS X Server: Do Not Use Spaces in Home Directory Share Point Name

Mac OS X Server clients (including Macintosh Manager clients) cannot find their users' home directories when the share point name contains a space.
This article has been archived and is no longer updated by Apple.

Symptom

When the share point containing the users' home directories has a space in the name, clients are not able to locate their home directory while logging in. This symptom will also be observed in any automounting share point, but it is most commonly encountered with home directories.

Solution

1. Open Workgroup Manager.
2. Stop sharing the share point.
3. Remove the spaces from the folder name in the Finder
4. Once all the spaces are removed, use Workgroup Manager to start sharing the folder again.

For each user that stored his home directory in this share point, you will need to reconfigure the user's home directory settings by selecting the "No Home" option. Save the changes, then select the proper share point using either "Network" or "Advanced". If you select "Network", be sure to select the proper share point and then save the changes. If you select "Advanced", be sure to complete the requested information and then save the changes.

Additional information

When spaces are used in a share point's name, the space is indicated as "%2520" in the "home_loc" property in the NetInfo database. The "%2520" string is the unicode representation of a space. Client computers expect to receive "%20" to indicate a space in the path, which is the ASCII representation of a space.

You should not manually edit the user's home_loc value. Removing the space, as recommended above, is the preferred solution.
Published Date: Oct 11, 2016

Mac OS X Server 10.2: Services and Applications That Do Not Work With Password Server

This document lists which Mac OS X Server services and related Apple products do not work with the Open Directory Password Server service.
This article has been archived and is no longer updated by Apple.
The following services and applications do not work with the password server in Mac OS X Server 10.2:

- Apple Remote Desktop 1.0 to 1.1 (Note 1)
- Macintosh Manager 2.0 to 2.2.1 (Note 2)
- NetInfo Manager (Note 3)
- Versions of AppleShare Client earlier than version 3.8.3 (Note 4)

Notes

1. Apple Remote Desktop versions 1.2 and later are compatible with Password Server.

2. Macintosh Manager versions 2.2.2 and later are compatible with Password Server.

3. To authenticate in NetInfo Manager, log in with an administrator account that does not use the Password Server service, such as root.

4. You should use AppleShare Client 3.8.8 and later. To use AppleShare Client 3.8.3, you must install the DHX UAM (Diffie-Hellman Exchange User Authentication Modules) package. AppleShare Client 3.8.3 can be downloaded from Apple Software Downloads (http://www.apple.com/swupdates/). The DHX UAM package is included with the AppleShare Client 3.8.3 download. AppleShare Client 3.8.5 has DHX UAM built in.

5. Various versions of AppleShare client may be downloaded from Apple Software Downloads (http://www.apple.com/swupdates/). Enter "AppleShare" in the search field on this page. Information on compatibility, for help in determining which you may need to download, may be found in technical document 16145, "**AppleShare: Platforms and OS Releases Supported**".

Published Date: Oct 11, 2016

Mac OS X Server 10.2.8 or Earlier: Cannot Create File or Folder Names Longer Than 31 Characters on Some Volumes

This document describes how to work around a situation in which you cannot remotely create a file or folder with a name longer than 31 characters. This occurs when connected via Apple File Protocol (AFP), of which various examples are named File Sharing, Personal File Sharing, and Apple File Service.

This article has been archived and is no longer updated by Apple.

Symptom

When you try to remotely create a file or folder on an Apple server with a name longer than 31 characters, an alert with this message appears:

> "The name <name of file> has too many characters and cannot be used".

Solution

You may use one of these workarounds:

- Create the file or folder on the client computer, then copy it to the server.
- If convenient, use a shorter file or folder name.
- Carbon and Cocoa applications may be able to create file names longer than 31 characters. Carbon and Cocoa are two types of Mac OS X-native applications.

Published Date: Oct 11, 2016

Mac OS X 10.2: How to Use High-Bit Characters in Terminal

The default configuration of Terminal does not allow you to drag items named with high-bit characters to the command line, or type high-bit characters there. High-bit characters include accented and special characters used in many languages. You may reconfigure Terminal to allow high-bit characters.

This article has been archived and is no longer updated by Apple.

Symptom

You cannot type high-bit characters at the command line or drag items named with them into the Terminal window.

Solution

1. Open Terminal.
2. Choose Windows Settings from the Terminal menu. The Terminal Inspector window appears.
3. Choose Emulation from the pop-up menu.
4. Make sure the checkbox for "Use option key as meta key" is not selected.
5. Select the checkbox for "Escape 8-bit chars with Ctrl-V".
6. Choose Display from the pop-up menu.
7. If necessary, choose Unicode (UTF-8) from the Character Set Encoding pop-up menu.

Note: If you are using tcsh or bash, make sure that "Escape 8 bit characters with Ctrl-V" is selected in the Emulation pane of the Terminal Inspector. If you are using zsh, make sure that "Escape 8 bit characters with Ctrl-V" is not selected. You can then drag/type names of folders with high-bit characters correctly. (tcsh/bash will show the escaped form of the character; zsh will show the actual character.)

Published Date: Oct 11, 2016

Mac OS X Server 10.2: Third-Party Disk Utilities May Turn Off Journaling

Third-party disk utilities that have not been updated to recognize journaling may turn off that feature in the course of repairing a volume.
This article has been archived and is no longer updated by Apple.

Symptom

A volume is no longer journaled after using a third-party disk utility. The Apple Disk Utility no longer indicates the volume is journaled.

Solution

You should check with your software vendor to get a version that has been updated to work with journaled volumes. You may use Disk Utility to turn journaling back on. See technical document 107248, "**Mac OS X Server 10.2: How to Journal a Volume or Repair a Journaled Volume**".

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Ink: Settings That Affect Handwriting Recognition

This document discusses a variety of settings and usage habits that affect how Ink recognizes your handwriting. This includes premature text recognition, difficulty writing certain letters, handwriting style, and use of pen as mouse (yellow paper appears too quickly).

This article has been archived and is no longer updated by Apple.

Symptom

These are behaviors you might encounter as you become familiar with your tablet and handwriting recognition:

- Your writing disappears when you try to dot an "i", cross a "t", or complete two-stroke letters such as a "k". The writing is thus recognized prematurely, and it appears in the target application as something other than what you intended.
- Some letters may seem more difficult to write than others. You might notice this with multi-stroke characters, like "k" and "E".
- Some handwriting styles are more difficult to use than others, and are not recognized as readily.
- You sometimes have difficulty using the pen as a mouse. The Ink writing space (yellow paper) may appear too quickly for you.

Solution

Settings that affect when text is recognized

Ink may prematurely try to recognize your writing if you lift your pen too high above the tablet when completing multi-stroke letters, or when you write anything else that causes you to lift your pen more than usual. This is due to the preference "Recognize my handwriting when the pen moves away from the tablet," which is on by default. This preference allows you to simultaneously enjoy competing benefits: a relatively long recognition delay, and an easy option for forcing immediate recognition (lifting the tip of your pen).

Additionally, you may prematurely invoke recognition if you have set the "Recognize my handwriting after" slider to an extremely short value.

To address the first, you need to practice keeping your pen lower, or deselect the preference. To address the second, try writing with the slider set to different delay values. Both of these preferences are accessed by clicking the Options button in the Ink preference pane.

Settings that affect ease of writing certain characters

When writing, you may be applying different, lighter amounts of pressure as you form certain characters. This can affect recognition. There are two things you can do to compensate for this. First, adjust the pen tip pressure setting to be "softer" in your tablet setup software, such as the Wacom Tablet application. This makes it easier for Ink to recognize lighter strokes. Second, try pressing down a little harder when you write (particularly if you do not want to change the pressure setting).

Note: If you see unintended gaps in your on-screen Ink, the gaps accurately reflect what Ink does and does not recognize. You should adjust your pen tip pressure (or simply press a little harder) until the gaps no longer appear. Gradients portrayed in on-screen Ink are for aesthetic purposes only, so you should only be concerned with actual gaps.

Handwriting styles that work best with Ink

Ink is optimized for printed characters and relatively straight lines, not for cursive writing. You may, however, experiment with tracing back over the straight lines of printed, non-cursive characters so that you complete them in one stroke. If you want to practice emulating a handwriting style, use the InkPad feature. The default font in InkPad is Apple Casual, and it is designed to best reflect the style that Ink recognizes.

Settings that affect when Ink is invoked, when yellow paper appears

There are three ways you can address this.

First, notice that by holding the tip of the pen just above the surface of the tablet, you may be able to mouse with the pen indefinitely without invoking Ink. You may need to adjust the pen tip pressure setting in your tablet's setup software, such as the Wacom Tablet application.

Second, experiment to find the settings you like best by following these steps:

1. Click the Options button in the Ink preference pane.
2. Drag the "Start inking after the pen moves" slider all the way to Long Delay.
3. Drag the "Use pen as mouse" slider all the way to Short delay.
4. Click OK.

You may not want to keep these extreme settings, but this will allow you to get a better feel for the timing. As you become accustomed, drag the sliders slowly back towards the middle, until you find the setting you like best.

Third, you may set the "Allow me to write" pop-up menu to "Only in Inkpad", then send your text from Inkpad to the target application. Your tablet driver software may allow you to toggle the "Allow me to write" setting via the pen button.

Mac OS X: About the Mac OS X 10.2.3 Update

This software updates Mac OS X 10.2.2 to version 10.2.3.
This article has been archived and is no longer updated by Apple.
This information is available in:

Français | Deutsch | Español | Italiano | Nederlands | Svensk

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin user and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install. Installation

Installation

There are two ways to update to Mac OS X 10.2.3.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Software Downloads (http://www.apple.com/swupdates/).

Two versions of the installer are available. One is for updating version 10.2.2 to 10.2.3, the other 10.2 or 10.2.1 to 10.2.3 (a "Combo" update). This document describes the former. If you need to use the Combo update, see technical document 107264, "**Mac OS X: About the Mac OS X 10.2.3 Update (Combo)**".

Enhancements Delivered with this update

This update delivers many enhancements, as outlined below.

Digital Hub and Peripheral Device Enhancements

- Works better with Force Feedback-based USB devices.
- Disc burning speed selection is now retained between Finder CD burns.
- Certain files and folders specific to Mac OS file systems, such as a Temporary Items folder or Desktop Folder, are no longer copied to the disc when burning a CD.
- Addresses a situation in which Disk Copy may not proceed beyond the "Configuring Burn" stage when used with some external FireWire-based CD burners.
- Addresses a potential issue in which some computers do not connect in FireWire Target Disk Mode.
- Improves compatibility for iPhoto and Image Capture with Canon IXY DV, Optura200MC, Elura 40MC, zr50, and GL2.
- Adds disc burning drivers for additional third-party burners, including: LaCie d2 CD-RW 48x12x48x FireWire, LaCie d2 CD-RW FireWire 52x24x52, and BUSLINK RW5252FM 52x24x52x

Networking, iChat and Modem Enhancements

- Addresses an issue in which the computer does not sleep if personal file sharing is turned on.

- Connect to Server may now connect to an FTP server when using the Japanese localized version of Mac OS X.
- Improves compatibility for USB-based CDC modems.
- Connections with iDisk volumes over a busy network or low-bandwidth connection are improved; for example, when trying to use an iDisk while also playing a streamed Internet radio broadcast via iTunes over a dial-up modem connection (PPP).
- Improves results when selecting iChat message text.
- Improves spacing when using Option-Return in an iChat message.
- Improves results when transferring file names via iChat that begin with a ">" character.

Application Enhancements

- Improves compatibility for the HP Communications application.
- Provides a zero all data feature in Disk Utility, for compatible hard drives.
- Improves iPhoto slide show function on some computers that use ATI Rage 128 graphics accelerator chips.
- Allows for improved results with applications that switch emulated address spaces, such as Connectix Virtual PC.
- Improves compatibility for OpenGL-based software on some computers that use ATI Rage 128 graphic accelerator chips; improves reliability for OpenGL-based software while Screen Saver effects are enabled on some computers that use ATI Rage 128 graphic accelerator chips.
- Addresses a situation in which some animated GIFs could cause Preview to unexpectedly quit.
- Allows for improved display of fonts via the Microsoft Word Font Toolbar.
- Improves compatibility with Netopia Timbuktu for TCP/IP connections.
- Improves compatibility for Image Capture when downloading large AVI files from some digital cameras.
- US English spellings are no longer interpreted as correctly spelled when using the built-in British English Dictionary.
- Improves compatibility for Mail when accessing accounts, such as AT&T Broadband, which require SSL v2 or v3 over SMTP.
- Addresses some situations in which the Mail application does not quit as expected.
- Addresses an issue in which Mail may become unresponsive when attaching certain kinds of JPEG files to a message.

Audio Enhancements

- Addresses a potential issue in which sound from some USB audio devices may "stutter" after waking from sleep.
- Addresses an issue in which iSub, when used with some third-party USB speakers, could produce static.
- Improves default reverb setting for applications which use QuickTime Musical Instruments.
- Addresses an issue in which audio recorded from a USB device with a sample rate of 48 kHz or 96 kHz may include distortion.
- Improves results when recording from a USB microphone with a sample rate of 11.025 kHz or 22.050 kHz.
- Addresses an issue in which a MIDI device may unexpectedly fail to be recognized, when several devices are connected.
- Reduces MIDI serial compatibility issues by limiting serial support; Apple supplies third-party developers with documentation necessary to provide serial support.

Printing and Print Center Enhancements

- Improves ability of Print Center to automatically find and add USB printers.
- Enhances default printer selection process after network printers have automatically been added.
- Printers configured with a Rendezvous name are now selectable from a Print dialog window.
- Improves notifications when a job cannot be printed due to a stopped print queue.

Other Enhancements

- Improves keyboard navigation behavior in Column view of Navigation Services dialogs, such as open and save dialogs.
- Addresses an issue in which the computer could become unresponsive when configuring the Screen Effects preference pane.
- Addresses a situation in which the Dock may unexpectedly quit when attempting to display a hierarchical submenu while certain background tasks are in progress.
- Reduces instances on some computers in which keypresses are not detected by the "Are you sure you want to shut down your computer now?" dialog box when some applications are open.
- Addresses a potential kernel panic situation when disconnecting a USB hub from a Power Macintosh G3 (Blue and White) computer.
- Adds a Canadian English language spell checking dictionary.
- Addresses an issue in which Keychain items could become unusable or not allow password changes after a series of different applications request modifications to the item.
- Addresses an issue in which some Power Macintosh G3 computers may be unable to start up in verbose mode with Mac OS X 10.2.1.
- Addresses a potential issue in which some applications may not quit as expected after a USB device is disconnected.
- Addresses a potential issue in which playing certain system alert sounds could cause the Login window to appear.
- Includes OpenGL 1.4 which contains improvements for all systems.

Mac OS X: About the Mac OS X 10.2.3 Update (Combo)

This software updates Mac OS X 10.2 or 10.2.1 to 10.2.3. It is a "combo" update that combines enhancements delivered with versions 10.2.1, 10.2.2, and 10.2.3. If you already have Mac OS X 10.2.2, you may download a smaller update that is not a combo.
This article has been archived and is no longer updated by Apple.
This information is available in:

Français | Deutsch | Español | Italiano | Nederlands | Svensk

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Users from the View menu. Select an Admin user and click Edit User. Click the Password tab. Change the password and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

Installation

There are two ways to update to Mac OS X 10.2.3.

Automatic Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Software Downloads (http://www.apple.com/swupdates/).

Two versions of the installer are available. One is for updating version 10.2.2 to 10.2.3, the other 10.2 or 10.2.1 to 10.2.3 (a "Combo" update). This document describes the latter. If you already have updated to 10.2.2, see technical document 107263, "**Mac OS X: About the Mac OS X 10.2.3 Update**".

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with both Mac OS X 10.2.1, 10.2.2, and 10.2.3. These enhancements are listed individually in these technical documents:

107036: "**Mac OS X: About the Mac OS X 10.2.1 Update**"

Installation

There are two ways to update to Mac OS X Server 10.2.3.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Software Downloads (http://www.apple.com/swupdates/).

Two versions of the installer are available. One is for updating version 10.2.2 to 10.2.3, the other 10.2 or 10.2.1 to 10.2.3 (a "Combo" update). This document describes the former. If you need to use the Combo update, see technical document 107266, "**Mac OS X Server: About the Mac OS X Server 10.2.3 Update (Combo)**".

Enhancements delivered with this update

This update delivers many enhancements, as outlined below.

Admin Guide documentation

- Enhanced documentation includes information about how to operate and configure NetBoot/Network Install, Directory Services Integration and Usage, QuickTime Streaming Server, Password Server, Open Directory Assistant, NFS resharing.

Apple File Service

- Added option for the inherited permissions model when copying files to the server. This option is available in Workgroup Manager.

Workgroup Manager

- Improved information updates when Computer Lists are being manipulated locally and remotely.
- Improves the configuration interface for Group Folder, which provides formatted examples of URLs and Paths.
- Group Folder names may contain spaces.
- Improved share point configuration performance.
- Allows Group Directory creation using the "CreateGroupfolder" Command-Line Tool for on-demand or automatic creation of Group Directories. In the updated Server Admin Guide, see page 202, "Defining an Advanced Group Volume."

Macintosh Manager

- Macintosh Manager 2.2.2 CD includes Deutsch, Japanese, and Français disk sets.
- Macintosh Manager share point is now visible in the list of share points.

Server Monitor

- Status Summary provides more reliable information about monitored servers and prevents conditions which could result in the message "No response from server."

Installation

- Time estimates during installation of Mac OS X Server are more accurate.
- Upgrading from Mac OS X Server 10.1 to Mac OS X Server 10.2.3 preserves proxy settings for each network interface.
- When upgrading a Mac OS X client computer with Mac OS X Server 10.2.3 using the "MacOSXServerInstall.mpkg" file, a restart is required. Restart your computer after any installation of Mac OS X Server.

Server Assistant

- Volume names with spaces and apostrophes are available for both local and remote installation of software using Server Assistant.
- Improved interface configuration when configuring many network interfaces.
- The underscore (_) character is an acceptable character in the hostname configuration.
- Upgrading Mac OS X 10.2 client systems with original usernames containing more than eight characters is supported. See technical document 107304, "**Mac OS X Server 10.2: Cannot Complete Setup Assistant After Installing Server Package**".

NetBoot and Network Install

- NetBoot Images can be compressed using Disk Copy.
- NetBoot Images created using the Network Image Utility can be modified using Disk Copy even if the uncompressed size of the image exceeds 2 GB. The final size of the Disk Image file (after compression) must be less than 2 GB for clients to properly start up.
- Network Image Utility can create images from DVD installation disks.
- Improved function and, and improved documentation in Admin Guide and Knowledge Base related to these items:
  - Updating an existing Mac OS X NetBoot disk image
  - Customizing a Mac OS X NetBoot Disk Image
  - Creating a Mac OS X NetBoot image from an existing system
  - Creating a Network Install disk image
  - Adding packages to an OS install image
  - Automating installation of an OS image
  - Information on "About the minstallconfig.xml" file
  - Selecting a Network Install image (from a Mac OS X client)

Note: To create a custom package install image (an image without system software), you must use a Mac OS X version 10.2.3 or later install disk. See the Server Admin Guide for more information on this topic.

Utilities

- Provides zero all data feature in Disk Utility, for compatible hard drives.
- Improved function of Package Maker utility, as related to maintaining file attributes within created packages.

General System Enhancements

Mac OS X Server 10.2.3 also includes enhancements of the standard, non-server operating system, as listed in technical document 107263, "**Mac OS X: About the Mac OS X 10.2.3 Update**".

Print Server

- Improved AppleTalk Print Queue reliability.
- Improved interface responsiveness related to print queue visibility in the client computer Chooser when queue is no longer available.

Mail Server

- Improved mail delivery performance of large enclosures to clients using Mail.app.

Web Server

- Updated to Apache version 2.0.43.
- Updated to Axis version 1.0.
- Updated to SquirrelMail version 1.2.9.

Other Enhancements

- MySQL version has been updated to 3.23.53.
- Open Directory Assistant allows you to configure IP address of en1 or other secondary active network interface card.

Ink: How to Write Return and Enter

You may want to use Return or Enter when writing in iChat, for example. They are not in the Gestures list.

This article has been archived and is no longer updated by Apple.

The "Vertical Space" gesture inserts a Return character. You may use it anywhere that Return or Enter might normally be required. In iChat, for example, this gesture will send your message.

It is possibly, though unlikely, that your application may distinguish between the insertion of a Return character and an actual keystroke. In that case, the Vertical Space gesture may not work. You could assign Enter or Return as a keystroke on one of your pen's buttons to achieve this effect. This is done in the tablet setup software, such as the Wacom Tablet application.

Published Date: Feb 20, 2012

Ink: About Writing on the Desktop or in the Finder

Using Ink to write on the desktop or in the Finder provides the same convenience of keyboard shortcuts. If you are not familiar with this type of navigation, the writing may seem not to go anywhere. This document explains how it works.

This article has been archived and is no longer updated by Apple.

It may seem like your writing on the desktop goes nowhere, but it is actually being used for navigation, just as keyboard shortcuts are. This is how it works:

Assume you have three files on your desktop named "Apple", "MyDocument", and "Journal". If you write "ap" on the desktop, then "Apple" would be selected. This works alphabetically. If you had many files on your desktop, writing a few letters or numbers would select the best alphabetic match. This same technique may be used in Finder windows, and it may be done on your keyboard.

Note: In Mac OS X versions 10.2 to 10.2.8, you cannot write in the Finder toolbar Search field.

Ink: Command-O Does Not Work as Expected

Command-O does not work as expected when using the Command key button in the Ink palette. Other combinations, such as Command-D or Command-I work as expected.

This article has been archived and is no longer updated by Apple.

Symptom

When you write the keyboard equivalent of "Command-O" in Ink, the intended menu command is not executed. In the Finder, for example, the selected item does not open. If you are using an application that has an action assigned to Command-0 (zero), then you might get that action instead.

Solution

Ink allows you to issue the equivalent of keyboard shortcuts by tapping the modifier key buttons in the Ink palette, followed by writing the letter that would normally be used in combination with the modifier key. When you try to enter Command-O, Ink recognizes the input as a zero and not the letter O. Other combinations, such as Command-D or Command-I work as expected.

This document will be updated when more information is available.

Ink: Handwriting Is Garbled and Slanted Down and to the Right

Your handwriting may be garbled and slanted if your tablet is set to mouse mode.

This article has been archived and is no longer updated by Apple.

Symptom

Handwriting is garbled, and it slants downward and to the right.

Solution

This happens when the tablet is in mouse mode. Put the tablet in pen mode.

Your tablet setup software, such as the Wacom Tablet application, should have a setting for pen mode or mouse mode. There may be certain situations in which your tablet software automatically switches modes. See the documentation included with your tablet software.

Mac OS X 10.2: Audio Distortion When Recording at 11 KHz or 22 KHz Over USB

You may hear distortion (pops, clicks) when recording 11 KHz or 22 KHz audio through a USB device.
This article has been archived and is no longer updated by Apple.

Symptom

You hear pops and clicks when you play audio recorded through a USB device at 11 KHz or 22 KHz.

Products Affected

- Mac OS X 10.2 to 10.2.2

Solution

If possible, record the audio at a different sample rate, such as 44.1 KHz or 48 KHz.

Alternatively, you may record audio through the computer's sound input port, if it has one.

This document will be updated as more information becomes available.

Mac OS 9: Quark Express 4 and ATI Radeon 7500 Video Cards

This document describes a compatibility issue between Quark Xpress 4 and the ATI Radeon 7500 video card, which is available with some Macintosh models.
This article has been archived and is no longer updated by Apple.

Symptom

The computer stops responding when you drag a picture using the content tool.

Products Affected

- Mac OS 9.2.2
- Quark Xpress 4
- ATI Radeon 7500 graphics accelerator card

Solution

Upgrade to Mac OS X, **or** upgrade to Quark Xpress 5.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.2: Cannot Change Dock, Burn Discs, or Use Certain System Preferences and Applications

This document describes two circumstances in which use of your computer may be restricted. This may affect application usage, disc burning (CD and DVD), System Preferences usage, Dock usage, and the ability to change your password.
This article has been archived and is no longer updated by Apple.

Symptom

You cannot do one or more of the following activities as expected:

- Open applications
- Burn discs (CD and DVD)
- Remove items from the Dock
- Use certain System Preferences features
- Change your password

Solution

Features designed to restrict use of a Macintosh computer

There are two circumstances in which it is normal for use of your computer to be restricted. The first circumstance is if an Admin user of your computer has placed restrictions on your non-Admin user account. This is done via the Capabilities feature of the Accounts preference pane. Capabilities can manage your ability to use applications, burn discs, remove items from the Dock, use certain System Preferences features, and change your password. Capabilities is further described in technical document 107180, "**Mac OS X 10.2: How to Manage User Access to Applications, System Preferences, and Disc Burning via 'Capabilities'**".

The second circumstance is when your computer has visited, or been used on, a network on which computers are managed by Workgroup Manager, a component of Mac OS X Server. Workgroup Manager can remotely control the same settings on your computer as Capabilities (and more) when you join a managed network as a Guest Computer.

How to determine which affects your computer

First you need to know if you are an Admin user. Open the System Preferences application, and look for the Accounts icon. If the Accounts icon is dimmed (unavailable), you are not an Admin user. If it is not dimmed, click it. Look in the Type column to see if your account type is "Admin".

If you are not an Admin user, stop here and ask an Admin user of the computer if your account has been restricted via the Capabilities feature. If it has been, you may stop here and resolve the issue with the help of your Admin user.

Admin users cannot be managed via Capabilities. If any user who is not managed via Capabilities experiences the symptoms above, the computer may have been used on a network on which Workgroup Manager is active. You would most likely encounter Workgroup Manager in a school, though it could be present anywhere Mac OS X Server is used.

When can Workgroup Manager control your computer?

Workgroup Manager cannot take control of your computer without, figuratively speaking, its permission. Remote management products made by Apple only allow a network administrator to control a computer after specific actions have been taken at that computer to allow such control. In the case of Workgroup Manager, "permission" is given when the computer makes an attempt during startup to connect to a NetInfo and/or LDAP server, which may subsequently manage the computer. In Mac OS X, the default setting is for your computer to attempt to connect to the NetInfo and LDAP servers (if any are present) that are specified via DHCP. This means your computer will allow itself to be managed via this method until you specifically deselect this default setting.

Note: Rest assured that the degree of control Workgroup Manager has over your computer does not allow the network administrator to remotely access or delete files on your computer. Thus falling under inadvertent control of Workgroup Manager does not constitute any risk for your data. This default setting is designed to ease network management for education environments and other large deployments of managed computers. This setting is not likely to inadvertently affect your computer, but its affects are easily undone in the event that it does.

Reversing or preventing inadvertent managed settings

You must be an Admin user of the affected computer to remove the managed settings. Under any circumstance, only an Admin user is authorized to remove managed settings.

To undo the restrictions placed on your computer by Workgroup Manager, see technical document 107172, "**Workgroup Manager: How to**

Clear Cached Settings".

To prevent Workgroup Manager from managing your computer in the future, deselect the default NetInfo and/or LDAP connection that allows Workgroup Manager to manage use of your computer. See technical document 107279, "**Mac OS X 10.2: How to Disable NetInfo and LDAP Connections at Startup**".

Published Date: Oct 11, 2016

Mac OS X: How to Disable NetInfo and LDAP Connections at Startup

This document explains how to disable the NetInfo and LDAP connection attempts that may occur during startup. Under certain circumstances, a startup delay may occur, or your computer may unexpectedly become managed.
This article has been archived and is no longer updated by Apple.

Symptom

If you have your computer configured to connect to a NetInfo and/or LDAP server at startup, you may see these symptoms:

- If your computer is on a network that does not have a NetInfo server, you may experience a startup delay in which a message about NetInfo appears above the progress bar.
- Your computer may unexpectedly join a network as a Workgroup Manager client. For further description of this possibility, see technical document 107278, "**Mac OS X 10.2: Cannot Change Dock, Burn Discs, or Use Certain System Preferences and Applications**".

Note: Only Mac OS X 10.2 or later can be a Workgroup Manager client.

Solution

Any Mac OS X computer may be set up to connect to a NetInfo or LDAP server during startup, but this is a default setting in later Mac OS X versions. If you need to disable these connection attempts, follow these steps:

Note: These steps describe Directory Access as it appears in Mac OS X 10.2 or later. They may vary slightly in earlier versions.

1. Open Directory Access (/Applications/Utilities/).
2. Click the lock button, and type your password.
3. Click OK.
4. If necessary, click the Services tab.
5. In the Enable column, deselect the checkboxes for NetInfo, LDAPv2, and LDAPv3.
6. Click the Apply button.
7. Quit Directory Access.

Mac OS X Server: About Server Admin Tools Update 10.2.3

This document provides information about the administration software applications and programs to remotely administer your Mac OS X Server. This article has been archived and is no longer updated by Apple.

About Administration Tools for Mac OS X Server

Information on Server Administration Software

The Server Administration Software installation package will allow you to install the following applications on a computer other than the server, for purpose of administering the server remotely. These tools require Mac OS X v10.2 or later.

- Workgroup Manager - for managing users, groups, computers, workgroups, and sharing privileges.
- Server Settings - for configuring network, file, Web, print, and mail services.
- Server Status - for monitoring the activity and state of each service running.
- Server Monitor - for monitoring the hardware status of Xserve servers
- Server Assistant and Open Directory Assistant - for setting up your Mac OS X Server and configuring the directory settings remotely
- Macintosh Manager Admin - for managing Macintosh Manager 2 workgroups, preferences and environments
- QuickTime Broadcaster - to use in conjunction with QuickTime Streaming Server
- QuickTime Player - to broadcast live and stored streams

The Installer also updates Mac Help files for Server Admin Tools. Additionally, updated versions of the "Getting Started with Mac OS X Server" and "Mac OS X Server Admin Guide" may be downloaded from Apple Software Downloads (http://www.apple.com/swupdates/).

Mac OS X Server 10.2: Man Page for automount Command

This document contains the man (manual) pages for the automount command, which are missing from Mac OS X 10.2 and Mac OS X Server 10.2.
This article has been archived and is no longer updated by Apple.
The text of the manual pages for automount is:

AUTOMOUNT(8) System Manager's Manual AUTOMOUNT(8)

NAME automount - automatic NFS mount / unmount daemon

SYNOPSIS automount [-d] [-tm secs] [-tl secs] [-m directory map] ...

DESCRIPTION

automount is a daemon that automatically mounts NFS filesystems when they are first accessed, and later unmounts them when they are idle.

automount creates a virtual filesystem mounted at one or more places on the client's file and directory hierarchy. Actual NFS mount points within this virtual filesystem appear as symbolic links. Reading a symbolic link triggers automount to mount the associated remote filesystem.

To make the trigger symbolic links used by automount distinguishable from normal symbolic links, the sticky bit is set in the mode flags for the link. Programs which would normally traverse symbolic links can test for this bit and avoid triggering the mount. Workspace Manager and ls have both been modified in this way.

Each virtual filesystem created by automount is governed by a corresponding map. One or more maps may be specified on the command line with a triple of the form:

-m directory map

Each map is rooted at the directory specified.

FILE MAPS

A map may be file or a special map. A file map is a regular file containing a list of entries of the form:

location mount_options server:path

mount_options must be a comma-separated list of options drawn from the options known to the mount and mount_nfs programs. automount will automatically mount the directory specified by server:path on the specified mount point within the map's virtual filesystem.

SPECIAL MAPS

In addition to reading files specifying mount maps, automount supports the -fstab map. This causes automount to read the fstab(5) database. All mounts with the net option will be mounted within the -fstab map's filesystem using a path of the form:

server/path

For example, if the fstab(5) database contained an entry for

polaris:/Library/Fonts

and automount was started as follows:

automount -m /Useful -fstab

Then the mount would appear in /Useful/polaris/Library/Fonts.

OPTIONS

-m directory map Associate the specified map with the given directory. The directory will be created if it doesn't exist. map may be the name of a file, or it may be the name of a special map. See the FILE MAPS and SPECIAL MAPS sections above.

-d Run automount in debug mode. The program remains attached to the command line and sends debugging information to standard output.

-tm secs Set the timeout for NFS mounts to secs seconds. The default value is 20 seconds.

-tl secs Set the time-to-live for NFS mounts to secs seconds. The default value is 3600 seconds. automount periodically checks all its mounted filesystems. If it finds any filesystems that have been idle for this time-to-live value, it will attempt to unmount them. An unmount will only be successful if there are no processes with open files in that filesystem.

SEE ALSO

mount(8), mount_nfs(8)

BSD March 9, 1998 BSD

Note: If you have upgraded your system from a previous version of Mac OS X to Mac OS X 10.2, the man pages for automount may be present.

Mac OS X 10.2: "Classic needs to update resources..." After Using Base or All Set in Extensions Manager

After selecting the Mac OS 9.2.2 Base or All set in the Extensions Manager control panel, an alert box appears when Classic starts.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears when Classic starts:

> "Classic needs to update resources in your selected Classic system folder, <path to folder>. These changes are needed to run Classic and do not affect your ability to use your computer with Mac OS 9."

Note: This issue does not occur the first time Classic is started, because Classic checks for these files before the Extensions Manager appears. But it will occur the next time Classic starts, unless the Extensions Manager set is changed (see Solution below). This message can occur in other situations. For example, it is normal to see this message the first time Classic starts from a System Folder that has not been updated by the currently installed version of Classic.

Solution

Click the Update button that appears in the "Classic needs to update..." dialog sheet.

This issue occurs because certain extensions that Classic needs may not be included in the Mac OS X 9.2.2 All or Base set. Some computers that include Mac OS 9.2.2 and Mac OS X 10.2 are not affected by this issue.

Mac OS X 10.2: German-Localized Mail Application May Not Keep Sent Mail Messages

The German-localized version of Mail 1.2 may not keep sent mails in the Sent folder.
This article has been archived and is no longer updated by Apple.

Symptom

Sometimes Mail does not save outgoing messages in the Sent folder, even if the preference for deleting sent mail in the Special Mailboxes tab is set to never.

Solution

Update to Mac OS X 10.2.4 or later.

Published Date: Feb 17, 2012

Macintosh: Computer Can Start Up From Mac OS X But Not From Mac OS 9

You may encounter a situation in which your computer can start up from Mac OS X, but not from Mac OS 9. Mac OS 9 disk drivers must be present to start up from Mac OS 9.

This article has been archived and is no longer updated by Apple.

Symptom

- The computer will no longer start up from Mac OS 9.
- If you select the Mac OS 9 System Folder in the Startup Disk preference pane of Mac OS X, a flashing question mark appears on the screen when you restart the computer.

Solution

It is likely that the disk was reformatted using Disk Utility for Mac OS X, and that the option to install the Mac OS 9 drivers was not selected. If you do this and then reinstall Mac OS 9 from the Restore CD set included with your computer, it will no longer start up from Mac OS 9, for example. Any time the Mac OS 9 drivers are not installed on the hard disk, you will not be able to start up from Mac OS 9. The resulting behavior is:

- The computer continues to start up from Mac OS X as expected.
- The Mac OS 9 System Folder can still be selected in the Classic preference pane in Mac OS X, and Classic starts successfully.
- The Startup Disk preference pane in Mac OS X lists the Mac OS 9 System Folder as a valid startup choice, but selecting this System Folder as the Startup Disk and restarting the computer results in the display of a flashing question mark at startup.

For more information, see technical document 75275: "**Mac OS X: About the 'Install Mac OS 9 Drivers' Option in Disk Utility**".

Mac OS X 10.2: Mail - How to Remove a .Mac Account

This document explains how to remove a .Mac account from Mail.
This article has been archived and is no longer updated by Apple.
Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Internet from the View menu.
3. Click the Email tab.
4. Deselect the checkbox for "Use .Mac Email account".
5. If any of your .Mac account information is listed in the other fields, either delete it or replace it with the information from the Email account you want to use.
6. Open Mail.
7. Choose Preferences from the Mail menu.
8. Click Accounts.
9. Select the .Mac account.
10. Click Remove.

Published Date: Oct 11, 2016

Mac OS X: Mail - How to Hide Address Book Group Member Names When Sending an Email

This document explains how to hide group member names and addresses when sending a message to a group created in Address Book.
This article has been archived and is no longer updated by Apple.
Follow these steps to hide group member names and email addresses:

1. Choose Preferences from the Mail menu.
2. Click Composing.
3. Deselect the checkbox for "When sending to a group, show all member addresses".

When you send an email to the group, only the groups name will be seen.
Published Date: Feb 17, 2012

Macintosh: Disk Image File Does Not Open With Disk Copy

This document explains what to do when a disk image file will not open, or "mount".
This article has been archived and is no longer updated by Apple.

Symptom

A disk image file will not open. This may occur immediately after you download it.

Note: Disk image files usually have a filename extension of ".img".

Solution

Mac OS X 10.2.8 or earlier

1. Open Disk Copy (/Applications/Utilities/).
2. Drag the disk image file icon into the Disk Copy window.

With Mac OS X 10.2 through 10.2.8, this can happen when an earlier version of Mac OS X is installed over a newer one with an Archive and Install installation. Use Software Update preferences to update your Mac OS X installation after you perform an Archive and Install installation.

If the disk image file still does not open, users of Mac OS X 10.2 (Note 1) may follow these additional steps:

1. Open Disk Utility (/Applications/Utilities/).
2. Select the Mac OS X startup disk in the left-hand column.
3. Click the First Aid tab.
4. Click Repair Disk Permissions.

After repairing permissions, try opening the disk image file again.

Notes:

1. If you have Mac OS X 10.1.5, you may use the Repair Privileges Utility, which is available from Apple Software Downloads (http://www.apple.com/swupdates/). If you have Mac OS X 10.1 through 10.1.4, you must update to version 10.1.5 to use the utility.

2. If you use Aladdin StuffIt Expander, note that Aladdin recommends using Disk Copy to open disk image files in Mac OS X (http://www.aladdinsys.com/support/techsupport/mac/) .

3. If an alert appears after you download a disk image file, you may need to configure your web browser to open disk image files with Disk Copy. See technical document 106171, "**Mac OS X: Double-Clicking a File Opens the Wrong Application**".

Mac OS 8 and 9

1. Open Disk Copy.
2. Drag the disk image file into the window that appears, as instructed.

If you use Aladdin StuffIt Expander, verify that a current, compatible version is installed (http://www.aladdinsys.com/support/techsupport/mac/).

To keep a web browser "helper application" from opening a downloaded disk image file, Control-click the link to the file in your browser's window, then select "Download File to Disk" or "Save Link Target As..." (the exact choice depends on which browser you use). You may wish to review the helper applications (if any) that are used for disk image files in your web browser's preferences.

If a repeating, non-dismissable "-127" alert message appears immediately after downloading a disk image file, you may regain control of your computer by following these steps:

1. Press the power button on the keyboard after dismissing one of the alert messages. A dialog box appears asking if you wish to Shut Down, Restart, or Sleep. You may need to dismiss a few more alert boxes before seeing this dialog box.
2. Click Restart or Shut Down.
3. You may need to dismiss a few more alert boxes before the computer restarts or shuts down.

Note: If these steps to not work, force quit the Finder by press Command-Option-Escape. If you are able to force quit, immediately restart your

computer.

Mac OS X Server: Some Features Require Use of the Password Server

Some features of Mac OS X Server 10.2 or later require use of the Password Server.
This article has been archived and is no longer updated by Apple.
The following features require use of the Password Server:

Password Options:

- Imposing minimum length
- Forcing change of password
- Preventing users from logging in after certain date
- Preventing users from logging in after a period of inactivity

Authentication Options:

- SMTP Authentication (Using CRAM-MD5)
- POP Authentication (Using APOP)
- Secure (non-clear text) SMB Authentication (Using NT/Lan Manager)

Mac OS X 10.2: Installation From Install Disc 2 Does Not Complete

Some installations from the Mac OS X 10.2 Install Disc 2 (CD) may not complete if the computer is left idle.
This article has been archived and is no longer updated by Apple.

Symptom

Larger installations using the Mac OS X 10.2 Install disc 2 do not complete if the computer is left idle.

Solution

Temporarily turn off the sleep feature, or move the cursor every few minutes to prevent the computer from going to sleep.

If you are installing on a portable computer, you should make sure that the power adapter is connected to a working electrical outlet.

Note: Most recent Macintosh computers should not be affected by this issue. The probability of this issue depends in part upon on how much software is installed from the CD, as well as the speed of the computer and the optical drive.
Published Date: Oct 11, 2016

Mac OS X Server 10.2 or later: How to Start PHP

This document explains how to start PHP in Mac OS X Server versions 10.2 and later.
This article has been archived and is no longer updated by Apple.

Important, before you begin

1. You will edit the "httpd.conf" file to start PHP service for Apache. Follow these steps carefully, and be sure not to change the file in any other way than specifically described.

2. If Apache does not work as expected or fails to start after you have modified the file, you can delete it and replace it with a duplicate of the "httpd.conf.default" file. After making a duplicate of the default, change its name to "httpd.conf" (to match the one you are replacing). Never modify the original "httpd.conf.default" file.

3. A number sign (#) in the front of a line indicates that the line will not be read by Apache when starting. Removing number signs, as described, causes Apache to read the configuration from that line.

4. Beyond the Knowledge Base, Apple does not offer technical support for configuring or using PHP. See http://www.php.net for more PHP information.

How to start PHP

For 10.2 to 10.2.8

Follow these steps at the server:

1. Choose Log Out from the Apple menu.
2. Log in as the root user. If you need help with this step, see About the root User and How to Enable It.
3. Open TextEdit.
4. Choose Open from the File menu.
5. In the Go To field, type: /etc/httpd/
6. Locate and open the file named "httpd.conf".
7. In this file, find the line that reads:

```
#LoadModule php4module /usr/libexec/httpd/libphp4.so
```

8. Remove the number sign (#) from the start of this line. Do not modify the line in any other way.
9. Scroll down until you find the line that reads:

```
#AddModule mod_php.c
```

10. Remove the number sign (#) from the start of this line. Do not modify the line in any other way.
11. Choose Save from the File menu.
12. Quit TextEdit.
13. Choose Log Out from the Apple menu.
14. Log in as an Admin user.
15. Open Server Admin and log in.
16. Stop and restart the Web Server.

For 10.3 or later

1. Open Server Admin.
2. Select the Web service from the desired server in the Computers & Services list.
3. Click on Settings.
4. Click Modules.
5. Enable or disable the php4_module as desired.
6. Save the changes.
7. Restart the Web Service.

You can verify that PHP is working correctly by connecting to the server and loading the "info.php" page (http://<insertdomain>/info.php). If you have changed the document root or moved this file you, may not be able to do this.

Published Date: Feb 17, 2012

Mac OS X 10.2 Updates: Printer Sharing Off After Update

Mac OS X 10.2.2 and Mac OS X 10.2.3 updates include a file (cupsd.conf) that turns off printer sharing. You simply need to turn on printer sharing again in System Preferences.
This article has been archived and is no longer updated by Apple.

Symptom

A shared printer is not available after updating to Mac OS X 10.2.2, or to Mac OS X 10.2.3 using the Mac OS X 10.2.3 Combo updater, or to Mac OS X 10.2.4 using the Mac OS X 10.2.4 Combo updater.

Note: If you are a software developer or advanced user who has customized the cupsd.conf file in any other way, those changes are also lost when this file is replaced during the update.

Solution

Turn on printer sharing. Follow these steps:

1. Choose System Preferences from the Apple menu.
2. Choose Sharing from the View menu.
3. Click the checkbox next to Printer Sharing to turn it on.

Published Date: Feb 17, 2012

Mac OS X 10.2.2: Application Unexpectedly Quits When Printing

When you try to print to a PostScript printer, the application you are printing from may unexpectedly quit ("crash") if the PPD for that print queue incorrectly identifies the default paper tray.
This article has been archived and is no longer updated by Apple.

Symptom

Note: If you are reading this prior to having experienced the symptom, save changes to your document before proceeding. Unsaved changes to a document may be lost when an application unexpectedly quits.

You encounter this sequence of events:

1. You create a new document, or open an existing document.
2. Choose the Print command in the application you are using.
3. The application unexpectedly quits when the Print panel would normally appear.

Note: Additional PostScript printers from these and other vendors may also be affected.

Solution

You may avoid this issue by updating to Mac OS X 10.2.3 or later. See technical document 107263, "**Mac OS X: About the Mac OS X 10.2.3 Update**".

For Mac OS X 10.2.2, you may be able to print to the PostScript printer by creating a new queue for the printer with the Generic PPD.

Note: When using this workaround, be sure to save your document before printing. In the event that you are unable to print, any unsaved changes to the document could be lost. Follow these steps:

1. Open Print Center (/Applications/Utilities/).
2. Select the affected print queue.
3. Click Delete.
4. Click Add.
5. Select the printer from the Name list (if necessary, choose the correct connection method and/or AppleTalk zone in the pop-up menus above the Name list).
6. Choose Generic from the Printer Model pop-up menu.
7. Click Add.
8. Open an existing document, or create a new document.
9. Print the document to the newly created print queue.

If the issue persists, additional troubleshooting may be required. See technical document 106714, "**Mac OS X: How to Troubleshoot Printing Issues**".

Additional information

After a PPD file is uncompressed, examining it with a text editor will typically reveal that the "DefaultInputSlot" attribute is incorrectly specified as "Unknown", where "Unknown" is not defined elsewhere in the PPD. Some other PPD errors known to cause this issue include the DefaultInputSlot attribute being incorrectly specified as "xyz " (contains trailing spaces) whereas everywhere else in the PPD the attribute is specified as "xyz", or the DefaultInputSlot parameter does not exist even though the PPD references input slots.

If crash reporting is enabled in Console preferences, the crash log will contain an entry similar to this one:

```

Mac OS X 10.2: Printing to Shared HP Printer Causes Application to Unexpectedly Quit

The application from which you are printing may unexpectedly quit ("crash") or stop responding when printing to a Hewlett Packard printer via printer sharing. This occurs at the printing computer when the sharing computer has a different HP driver version installed.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to print, the printing application unexpectedly quits or stops responding. This can happen when the printer is directly connected directly or if the HP printer is selected in the Print dialog box.

If crash reporting is enabled in Console preferences, the crash log may contain an entry similar to this one:

```
Exception: EXC_BAD_ACCESS (0x0001)
Codes: KERN_INVALID_ADDRESS (0x0001) at 0x656e747f

#13 0x91d137c8 in PJCPrintDialogMain
#14 0x91d155d0 in PMSessionPrintDialogMain
```

Solution

At each computer, follow these steps:

1. Log in as an Admin user.
2. Click the Finder icon in the Dock.
3. Choose Go to Folder from the Go menu.
4. Type: /Library/Printers/
5. Click Go.
6. Drag the "hp" folder to the Trash.
7. Download the latest printer drivers from the HP website, then install them as instructed.

Important: There is a separate issue with Mac OS X 10.2.2 and the latest versions of HP drivers, depending on which printer you have. The issue may be avoided by updating to Mac OS X 10.2.3. Before installing new HP drivers, review these technical documents:

32147: "**Mac OS X 10.2.2: Sluggish System Performance After Installing HP Printer Drivers**"
107263: "**Mac OS X: About the Mac OS X 10.2.3 Update**"

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Disk Utility reports some messages that you can ignore when checking permissions

This article has been archived and is no longer updated by Apple.

You can safely ignore certain messages that Disk Utility reports when checking permissions. For example, you may safely ignore a message that contains "permissions are 33261". This article applies to Mac OS X 10.2.2 or later.

You can safely ignore any message that begins with "We are using special permissions for..." or "We are using a special uid for...". These are status messages and not a cause for concern. The message(s) will appear each time you check permissions.

Other messages that you can safelyignore when checking permissions

After running periodic monthly messages such as this may appear and can also be safely ignored: "Permissions differ on ./private/var/log/install.log, should be -rw-r--r-- , they are -rw-r----- Owner and group corrected on ./private/var/log/install.log Permissions corrected on ./private/var/log/install.log"

Mac OS X 10.2: "Software Update is not able to connect to the Internet" Alert

The Software Update feature of Mac OS X 10.2 cannot work if your computer uses a proxy server that requires authentication (a name and password).
This article has been archived and is no longer updated by Apple.

Symptom

When checking for updates in the Software Update pane of System Preferences (either manual or scheduled), an alert with this message appears:

> "Software Update is not able to connect to the Internet. Please check your configuration and try again."

Solution

Manually download and install any required updates from Apple Software Downloads (http://www.apple.com/swupdates/).
Published Date: Oct 11, 2016

Mac OS X: Aliases to Recent Servers in the Classic Apple Menu Do Not Work

When you connect to a server via AppleTalk in the Classic Chooser, any alias made to the server will fail, including the aliases in the Recent Servers folder of the Classic Apple menu.
This article has been archived and is no longer updated by Apple.

Symptom

When you choose a server from the Recent Servers folder in the Classic Apple menu, the computer does not connect to the server.

Solution

To connect immediately, use either the Chooser or the Connect to Server command in the Go menu of the Mac OS X Finder.

To create a working alias

First delete the non-working alias from the Classic Recent Servers folder by dragging it to the Trash. (Aliases are saved in the Apple Menu Items folder inside the System Folder.) Next, follow the steps below according to the server.

If the server offers Apple file service over Internet Protocol (IP), use these steps:

1. Choose Chooser from the Classic Apple menu.
2. Click the AppleShare icon in the Chooser.
3. Click the Server IP Address button.
4. Enter the server's IP address or DNS name.
5. Click Connect. This should produce a working alias in the Recent Servers list of the Classic Apple Menu.

Note: The remaining steps are for Mac OS X 10.1 to 10.3.9 only, because Mac OS X 10.4 does not support AFP over AppleTalk.

If the server only offers AppleTalk connections, follow these steps:

1. Click the Finder icon in the Dock.
2. Choose Connect to Server from the Go menu.
3. Enter the server's IP address or DNS name.
4. Click Connect.
5. Select the server volume in the Finder.
6. Choose Make Alias from the File menu.

Mac OS X: Man (Manual) Pages for "exports" Command

The man (manual) pages for the exports command are part of the BSD SDK package in Mac OS X and X Server 10.2. This package is not part of the default installation.
This article has been archived and is no longer updated by Apple.

Symptom

Typing the man exports command in a Terminal session produces the output "No manual entry for automount".

Solution

To install the man pages for the exports command, select the BSD SDK package in the Mac OS X or X Server Installer.

For convenience, the contents of the man pages are also printed below:

EXPORTS(5) System File Formats Manual
EXPORTS(5)

NAME

exports - define remote mount points for NFS mount requests

SYNOPSIS

exports

DESCRIPTION

The exports file specifies remote mount points for the NFS mount protocol per the NFS server specification; see Network File System Protocol Specification RFC 1094, Appendix A and NFS: Network File System Version 3 Specification, Appendix I.

Each line in the file (other than comment lines that begin with a #) specifies the mount point(s) and export flags within one local server filesystem for one or more hosts. A host may be specified only once for each local filesystem on the server and there may be only one default entry for each server filesystem that applies to all other hosts. The latter exports the filesystem to the ``world'' and should be used only when the filesystem contains public information.

In a mount entry, the first field(s) specify the directory path(s) within a server filesystem that can be mounted on by the corresponding client(s). There are two forms of this specification. The first is to list all mount points as absolute directory paths separated by whites- pace. The second is to specify the pathname of the root of the filesys- tem followed by the -alldirs flag; this form allows the host(s) to mount at any point within the filesystem, including regular files if the -r option is used on mountd. The pathnames must not have any symbolic links in them and should not have any "." or ".." components. Mount points for a filesystem may appear on multiple lines each with different sets of hosts and export options.

The second component of a line specifies how the filesystem is to be exported to the host set. The option flags specify whether the filesys- tem is exported read-only or read-write and how the client uid is mapped to user credentials on the server.

Export options are specified as follows:

-maproot=user The credential of the specified user is used for remote access by root. The credential includes all the groups to which the user is a member on the local machine (see id(1)). The user may be specified by name or number.

-maproot=user:group1:group2:... The colon separated list is used to specify the precise credential to be used for remote access by root. The elements of the list may be either names or numbers. Note that user: should be used to distinguish a credential containing no groups from a complete credential for that user.

-mapall=user or -mapall=user:group1:group2:... specifies a mapping for all client uids (including root) using the same semantics as -maproot.

The option -r is a synonym for -maproot in an effort to be backward compatible with older export file formats.

In the absence of -maproot and -mapall options, remote accesses by root will result in using a credential of -2:-2. All other users will be mapped to their remote credential. If a -maproot option is given, remote access by root will be mapped to that credential instead of -2:-2. If a -mapall option is given, all users (including root) will be mapped to that credential in place of their own.

The -kerb option specifies that the Kerberos authentication server should be used to authenticate and map client credentials. This option requires that the kernel be built with the NFSKERB option.

The -ro option specifies that the filesystem should be exported read-only (default read/write). The option -o is a synonym for -ro in an effort to be backward compatible with older export file formats.

The third component of a line specifies the host set to which the line applies. The set may be specified in three ways. The first way is to list the host name(s) separated by white space. (Standard internet ``dot'' addresses may be used in place of names.) The second way is to specify a ``netgroup'' as defined in the netgroup file (see netgroup(5)). The third way is to specify an internet subnetwork using a network and network mask that is defined as the set of all hosts with addresses within the subnetwork. This latter approach requires less overhead within the kernel and is recommended for cases where the export line refers to a large number of clients within an administrative subnet.

The first two cases are specified by simply listing the name(s) separated by whitespace. All names are checked to see if they are ``netgroup'' names first and are assumed to be hostnames otherwise. Using the full domain specification for a hostname can normally circumvent the problem of a host that has the same name as a netgroup. The third case is specified by the flag -network=netname and optionally -mask=netmask. If the mask is not specified, it will default to the mask for that network class (A, B or C; see inet(5)).

For example:

```
/usr /usr/local -maproot=0:10 friends
/usr -maproot=daemon grumpy.cis.uoguelph.ca 131.104.48.16
/usr -ro -mapall=nobody
/u -maproot=bin: -network 131.104.48 -mask 255.255.255.0
/u2 -maproot=root friends
/u2 -alldirs -kerb -network cis-net -mask cis-mask
```

Given that /usr, /u and /u2 are local filesystem mount points, the above example specifies the following: /usr is exported to hosts friends where friends is specified in the netgroup file with users mapped to their remote credentials and root mapped to uid 0 and group 10. It is exported read-write and the hosts in ``friends'' can mount either /usr or /usr/local. It is exported to 131.104.48.16 and grumpy.cis.uoguelph.ca with users mapped to their remote credentials and root mapped to the user and groups associated with ``daemon''; it is exported to the rest of the world as read-only with all users mapped to the user and groups associated with ``nobody''.

/u is exported to all hosts on the subnetwork 131.104.48 with root mapped to the uid for ``bin'' and with no group access.

/u2 is exported to the hosts in ``friends'' with root mapped to uid and groups associated with ``root''; it is exported to all hosts on network ``cis-net'' allowing mounts at any directory within /u2 and mapping all uids to credentials for the principal that is authenticated by a Kerberos ticket.

FILES

/etc/exports The default remote mount-point file.

SEE ALSO

netgroup(5), mountd(8), nfsd(8), showmount(8)

BUGS

The export options are tied to the local mount points in the kernel and must be non-contradictory for any exported subdirectory of the local server mount point. It is recommended that all exported directories within the same server filesystem be specified on adjacent lines going down the tree. You cannot specify a hostname that is also the name of a netgroup. Specifying the full domain specification for a hostname can normally circumvent the problem.

Mac OS X: How to Delete a Classic Application‘s Temporary Files When Emptying the Trash Does Not

Some Classic applications may not place their temporary files in the Trash as expected. Emptying the Trash, therefore, does not delete them. This document explains how you may delete them.
This article has been archived and is no longer updated by Apple.
Note: This document applies to Mac OS X versions 10.2.8 and earlier.

Some Classic applications may save files to an incorrect Trash location. Choose steps according to how you have software installed on your computer.

Single volume installation

If Mac OS X and the Classic (Mac OS 9) System Folder are on the **same** hard disk volume (this is default configuration), follow these steps:

1. Click the Finder icon in the Dock.
2. Choose Go To Folder from the Go menu.
3. Type: `/Trash`
4. Press Return.
5. Select all files in the window. (If this folder is empty, there are no files to delete.)
6. Drag the files to the Trash.
7. Choose Empty Trash from the Finder menu.

Multiple volume installation

If Mac OS X and the Classic (Mac OS 9) System Folder are on **different** hard disk volumes (two partitions, for example), follow these steps:

1. Click the Finder icon in the Dock.
2. Choose Go To Folder from the Go menu.
3. Type: /Volumes/<Mac_OS_9_volume_name>/Trash

   Note: You would replace "<Mac_OS_9_volume_name>" with the actual name of the volume on which your Mac OS 9 System Folder is installed. If it was installed on a disk partition named "Blue", then you would type:

   /Volumes/Blue/Trash

   Mac OS X may automatically complete the volume's name as you type.

4. Press Return.
5. Select all files in the window. (If this folder is empty, there are no files to delete.)
6. Drag the files to the Trash.
7. Choose Empty Trash from the Finder menu.

Published Date: Feb 17, 2012

Mac OS X Server 10.2: Cannot Complete Setup Assistant After Installing Server Package

If you install the "MacOSXServerInstall" package from the Mac OS X Server 10.2 Installation CD on a computer that already has the standard, non-server version of Mac OS X 10.2 installed, then the Mac OS X Server Setup Assistant may not complete. This occurs if the Admin user name created in Mac OS X 10.2 is longer than eight characters.
This article has been archived and is no longer updated by Apple.

Symptom

Mac OS X Server Setup Assistant does not complete after installing the Mac OS X Server 10.2 package (MacOSXServerInstall.mpkg).

Solution

This issue is resolved in Mac OS X Server 10.2.3 or later. See technical document 107265, "**Mac OS X Server: About the Mac OS X Server 10.2.3 Update**".

The following workaround may be used when installing an earlier version.

You may resolve this issue by changing user ID (UID) numbers. Follow these steps:

1. Start up the computer in single-user mode. If you need help, see technical document 106388, "**Mac OS X: How to Start Up in Single-User or Verbose Mode**".

2. Gain write access by typing this command:

```
mount -w /
```

3. Press Return. An admin user exists with a UID of either 501 or 502.

4. Use the following commands to find the Admin user, pressing Return after each command:

```
nicl -raw /var/db/netinfo/local.nidb -read /name=users/uid=501
nicl -raw /var/db/netinfo/local.nidb -read /name=users/uid=502
```

One of these will return a user record for the Admin user. You must now cycle through the UIDs in the 50x range to find an available UID.

5. Entering the following command:

```
nicl -raw /var/db/netinfo/local.nidb -read /name=users/uid=503
```

If the text "read: Invalid Path" is returned, skip to Step 7.

6. Increment the number at the end of the command by one until the text "read: Invalid Path" is returned (504, 505, 506, and so forth).

7. Change the UID of the Admin user to the available UID by entering the following command:

```
nicl -raw /var/db/netinfo/local.nidb -create /users/yyy uid xxx
```

Note: When typing, you would replace "yyy" the actual value of "name:" in the user record for the Admin user, and "xxx" with the available UID that you found previously.

8. Type: `exit` then press Return

The computer starts up and the Setup Assistant appears.

9. Create a new Admin user in the Setup Assistant.

Note: After completing the Setup Assistant and restarting the computer, you can use the Workgroup Manager application to change the UID of your newly-created Admin user to something else, then change the UID of your original admin user back to 501 or 502, if desired.

Mac OS X Server 10.2: How to Configure the Group Volume to Mount When Logging In

This document explains how to configure the Group Volume feature so that the volume automatically "mounts" when logging in at a managed Mac OS X client computer.
This article has been archived and is no longer updated by Apple.
Follow these steps:

1. In Workgroup Manager, select a group.
2. Select Preferences, Login.
3. Click the Login Items tab.
4. Select the "Add group share point" checkbox.
5. Click Apply Now.

Optionally, if you want the group volume to appear in the Dock:

1. For the groups preferences, select Dock.
2. Click the Dock Items tab.
3. Select the "Add group folder" option.
4. Click Apply Now.

Note: The group folder is not created immediately. It is created by a cron job overnight. If you want to force immediate creation of the group folder, you may use the CreateGroupFolder command in Terminal. For more information on this command, see page 202 of the Server Admin Guide for Mac OS X 10.2.3 or later.

For more information, see technical document 107308, "**Mac OS X Server 10.2: Clients Cannot Select a Workgroup While Logging In**".
Published Date: Feb 17, 2012

Mac OS X Managed Client: Cannot Select a Workgroup While Logging In

When logging in with a managed Mac OS X client, some or all workgroups do not appear and cannot be selected.
This article has been archived and is no longer updated by Apple.

Symptom

Workgroups do not appear and cannot be selected when you log in with a managed client.

Solution

If no managed preferences are configured for a group, the group is not considered a workgroup. Workgroups appear when logging in from a managed Mac OS X client. To learn the difference between a group and a workgroup in Mac OS X 10.2 Server, see technical document 107309, "**Mac OS X Server 10.2: How to Differentiate Between a Group and a Workgroup**".

If no workgroups appear when logging in on a managed Mac OS X client, verify the user logging in belongs to more than one managed workgroup. To display the workgroup selection dialog while logging in, it may be necessary to manage an option for at least two workgroups the user belongs to.

It is also possible the user selected the option to remember his choice while logging in. Selecting this option prevents the workgroup selection dialog from being presented. To present this dialog after the remember option has been selected, press the Shift key while logging in.
Published Date: Feb 17, 2012

Mac OS X Server 10.2 or later: "mod_hfs_apple" protects web content against case insensitivity in the HFS file system

In Mac OS X Server 10.2 or later, "mod_hfs_apple" has been enhanced to protect web content against case insensitivity in the HFS File System. If this feature is used, security realms are enforced on any web folders/directories regardless of letter case used in a URL to access the served web content.
This article has been archived and is no longer updated by Apple.

Warning:

1. The protection afforded by mod_hfs_apple applies only to the default webserver, apache1. If you have chosen to use apache2, beware that these protections do not apply.
2. For important related information, see Protection for sensitive files when using Apache on an HFS+ volume.

Note: This document is a reproduction of information included with Late Breaking News in Mac OS X Server 10.2.2.

The HFS Extended volume format commonly used for Mac OS X Server preserves the case of file names but does not distinguish between a file or folder named "Example" and one named "eXaMpLe". Were it not for mod_hfs_apple, this would be a potential issue when your web content resides on such a volume and you are attempting to restrict access to all or part of your web content using security realms. If you set up a security realm requiring browsers to use a name and a password for read-only access to content within a folder named "Protected", browsers would need to authenticate in order to access the following URLs:

http://example.com/Protected
http://example.com/Protected/secret
http://example.com/Protected/sECreT
But they could bypass it by using something like the following:

http://example.com/PrOtECted
http://example.com/PrOtECted/secret
http://example.com/PrOtECted/sECreT

Fortunately, mod_hfs_apple prevents those types of efforts to bypass the security realm, and it's enabled by default.

Note that mod_hfs_apple operates on folders; it is NOT intended to prevent access to individual files. A file named "secret" can be accessed as "seCREt". This is correct behavior, and does not allow bypassing security realms.

Because of the warning message that appears in the Web Service error log about mod_hfs_apple, there have been questions about the function of mod_hfs_apple. The warning messages do not indicate a problem with the correct function of mod_hfs_apple.

You can verify that mod_hfs_apple is operating correctly by creating a security realm, and attempting to bypass it with a case-variant of the actual URL. You will be denied access and your attempt is logged in the Web Service error log with messages similar to the following:

[Wed Jul 31 10:29:16 2002] [error] [client 17.221.41.31] Mis-cased URI:
/Library/WebServer/Documents/PrOTecTED/secret, wants:
/Library/WebServer/Documents/Protected/

Mac OS X: Stickies Undo Command Works Inconsistently

The Undo command in Stickies may work on an inconsistent or intermittent basis. Changes may not be undone when you choose this command.
This article has been archived and is no longer updated by Apple.

Symptom

Choosing the Undo command may not always undo changes in Stickies.

Solution

If you prefer, use another application for taking notes, such as TextEdit.
Published Date: Feb 17, 2012

Mac OS X 10.2 through 10.3.9: Wrong folder moved to Trash when deleting in Finder in column view

This article has been archived and is no longer updated by Apple.

Deleting a new, untitled folder without first renaming it (in column view) may inadvertently move the parent folder to the Trash under certain circumstances. This article applies to Mac OS X 10.2 through 10.3.9.

When you create a new folder, the name is immediately editable. If you move that folder to the the Trash via one of two specific methods before entering a name **and** the Finder window is in column view, then the parent folder will be moved to the Trash. (The parent folder is the one that contains the new folder.) This happens regardless of how you move the folder to the Trash. The two specific methods that result in this issue are:

- Using the Command-Delete key combination in the Finder
- Choosing Move to Trash from the File menu in the Finder

Solution

Use one of these solutions:

1. Click the Finder icon in the Dock.
2. Choose "Undo move of 'untitled folder'" from the Edit menu. (If you have done other tasks since deleting, this option may not be available.)

1. Click the Trash icon in the Dock to open it.
2. Drag the folder you inadvertently moved there to its original location.

Warning: If you empty the Trash, the folders and their contents will be deleted.

This issue does not occur if you edit names of folders that already exist. It only affects newly created folders.
Published Date: Feb 17, 2012

Apple Remote Desktop 1.1: Cannot Change Upper or Lower Case of Client Computer Name

When you try to change the letter case of a Mac OS 8 or 9 client computer name, an alert with the message "Error: Command Failed" appears.
This article has been archived and is no longer updated by Apple.

Symptom

Apple Remote Desktop allows you to change the AppleTalk name of client computers. If you try to change only the case of a Mac OS 8 or Mac OS 9 client computer name, the attempt fails. The status of the computer will be listed as:

> "Error: Command Failed"

Solution

To work around the issue, follow these steps:

1. Change the name of the client computer from the current name you want to a different name you don't want.
2. Change the name back to the name you want, including the desired case.

Published Date: Oct 11, 2016

Mac OS X: Cannot Use Floppy Disk When Formatted as Mac OS Extended (HFS Plus) via Disk Utility

A floppy disk cannot be used if you format it as Mac OS Extended (HFS Plus) using Disk Utility.
This article has been archived and is no longer updated by Apple.

Symptom

A floppy disk is no longer recognized. If you use Console, it reports:

> "/sbin/newfs_hfs: /dev/rdisk2s2: partition is too small (minimum is 4 MB)"

Solution

Floppy disks are too small to allow Mac OS Extended format, which requires at least a 4 MB disk. To correct the issue, reformat the disk as Mac OS Standard, Unix File System, or MS-DOS File System.

Mac OS X Server 10.2: Unable to receive mail after upgrading from Mac OS X Server 10.1

Email sent to the server after the upgrade may be returned with a message indicating that delivery failed because the sender is not a valid local user on the SMTP server.
This article has been archived and is no longer updated by Apple.

Symptom

The server can send mail without issue, but it will not accept incoming mail. A sender may receive a message indicating the mail was rejected because she is not a valid user on the SMTP server.

Products Affected

- Mac OS X Server 10.2 to 10.2.8

Solution

This occurs if the server was previously set to use the "Require local 'From' address to exist in Users and Groups" and then updated to Mac OS X Server 10.2. To resolve the issue, follow these steps:

1. Use Server Settings to stop Mail service.
2. Open NetInfo Manager (/Applications/Utilities).
3. Click the lock button to authenticate as an Admin user.
4. In the local domain, navigate to /config and select AppleMailServer.
5. In the lower pane, scroll to the require_local_from_flag property.
6. Double click on the value for this property and change it from "1" to "0".
7. Choose Save Changes from the Domain menu.
8. Restart Mail service.

Published Date: Oct 11, 2016

Xserve: "Out of Range" Message at Startup

When starting an Xserve using Mac OS X Server, the display shows an "out of range" message. This document explains how to correct this issue.
This article has been archived and is no longer updated by Apple.

Symptom

When starting up an Apple computer from Mac OS X Server 10.1 or later, a display shows an "out of range" message.

Solution

This issue normally happens if a video resolution is specified that the display device is not capable of producing.

First, reset the parameter RAM (PRAM) on the Xserve by holding down the Command-Option-P-R key combination during startup, followed by holding the Shift key during startup. This may allow you to start up normally and change the display resolution using System Preferences. If you cannot, try the steps below, which deal with the video resolution information that is stored in three places:

- PRAM
- /Library/Preferences/com.apple.windowserver.plist
- ~/Library/Preferences/ByHost/com.apple.windowserver.xxxx.plist

Note: The tilde symbol (~) designates a user's home folder. The text "xxxx" represents an alpha numeric string, such as "00306549719e".

The following steps will reset the video resolution to default value.

Warning: These steps include use of the "rm" command. Be sure to type the commands exactly. Misuse of the rm command may result in accidental data loss, up to and including all data on the target disk. To be sure you are reading the commands below correctly, you may copy and past them into a text editor for verification.

1. Start up the computer in single-user mode. For help with this step, see technical document, 106388, "**Mac OS X: How to Start Up in Single-User or Verbose Mode**".

2. This step contains a series of commands, each preceded by the pound sign (#). You should type each, pressing Return after each to execute it before continuing to the next.

```
# fsck -y
```

Note: If the result of this file system check is: "***** FILE SYSTEM WAS MODIFIED *****" then repeat fsck -y until the result is "** The volume xxxx appears to be OK", Where "xxxx" is the name of the computer's startup volume.

```
#mount -uw /
#rm /Library/Preferences/com.apple.windowserver.plist
#cd /Users/username/Library/Preferences/ByHost
#ls
```

Note: Using the ls command here lists all the visible files and folders in the ByHost folder. Locate the file named "com.apple.windowserver.xxxx.plist", where "xxxx" is an alpha numeric string.

```
# rm com.apple.windowserver.xxxx.plist
```

Note: In place of "com.apple.windowserver.xxxx.plist", use the file name you located in the last step. This step deletes the file located in the last step.

```
# reboot
```

Note: This command restarts the computer.

3. Reset PRAM on the next system startup. For help with this step, see technical document 2238, "**Macintosh: How to Reset PRAM and NVRAM**".

Note: The Xserve has no speaker, so there is no second start up tone to indicate the PRAM has been reset. Instead, watch the system activity lights. When the LEDs start from the middle light and extend out both directions after the initial startup, then the PRAM has been reset.
Published Date: Oct 11, 2016

Mac OS X Server 10.2.1 - 10.2.8: How to Broadcast a QuickTime Stream to a Reflecting Server

With Mac OS X Server 10.2.1 through 10.2.8, you may stream and broadcast on the same server. If you wish to use a second streaming server as a reflecting server, this document explains how.
This article has been archived and is no longer updated by Apple.
A "reflecting" server, one that is to receive your broadcast stream and reflect it, must have a Broadcast User name and password set separately for broadcast reception and reflection. This is separate from the QuickTime Streaming Server Admin user account and password that the original installation Setup Assistant requests. Follow these steps:

1. Open a web browser and connect to the reflecting server's streaming server admin at port 1220 (for example, **http://address_of_reflecting_server:1220**).

2. Log in using the QuickTime Streaming Server Admin user name and password originally configured in the Server Assistant. If this is the first time you have done this, a web-based Setup Assistant will open. This assistant will prompt you for a Broadcast User password and confirmation, but it may not give you an opportunity to assign a Broadcast User name.

3. If you are not prompted for the Broadcast User name, you need to make some additional settings in QTSS Admin. Select General Settings from the list of options, then Change Movie Broadcast Password, which will let you define the Broadcast User name as well as the corresponding password.

4. At the broadcast source server, open QuickTime Broadcaster, and select Show Details. Click the Network tab, and enter the new name and password information into the Username and password fields. Be sure that the file name is what you want it to be (the default is "mystream"), then start QuickTime Broadcaster.

To connect with QuickTime Player, connect to the reflecting server using this URL format:

```
rtsp://address_of_reflecting_server/my_stream_name
```

Published Date: Oct 11, 2016

Mac OS X Server: NetBoot Uses User ID (UID) Numbers 100 to 149

When DHCP/NetBoot is turned on in Server Settings (version 10.2 or later) or Server Admin (versions 10.0.3 to 10.1.5), UIDs 100 through 149 are assigned to NBUsers 1 through 50 in the Local NetInfo Domain.
This article has been archived and is no longer updated by Apple.

Symptom

When DHCP/NetBoot is turned on in Server Settings (version 10.2 or later) or Server Admin (version 10.1.5 and earlier), UIDs 100 through 149 are assigned to NBUsers 1 through 50 in the Local NetInfo Domain.

When two or more accounts have the same UID, the operating system treats them all as the same account. This can result in issues with ownership and access, such as too much access or loss of ownership.

Solution

If NetBoot will be used, assign the NBUsers different UID numbers so they will not overlap with the other users. By doing this, you avoid reconfiguring the ownership of existing home directories.

Mac OS X Server 10.2 or later automatically starts assigning UID numbers 1025 and higher to new users, so it would only be affected if the server was upgraded from an earlier version or the users were imported with pre-existing UIDs.
Published Date: Oct 11, 2016

Mac OS X: How to Set Up Multiple IP Addresses on the Same Network Interface

This document explains how to set up multiple IP addresses on the same network interface (or port), a practice sometimes known as multihoming or IP aliasing.
This article has been archived and is no longer updated by Apple.
In Mac OS X, this is achieved simply by creating a new port configuration for each IP address that you need to use. Give each new port configuration the IP information that is appropriate for your network scenario. To learn how to create a port configuration see technical document 106800, "**Mac OS X: How to Create Port Configurations**".

Note: If you are using Mac OS X Server version 10.0.3 to 10.1.4, different steps are required. For these products see technical documents:

106418: "**Mac OS X Server 10.0: How to Set up Multiple IP Addresses on a Single Network Interface**"
106600: "**Mac OS X Server 10.1: How to Set up Multiple IP Addresses on a Single Network Interface**"
Published Date: Feb 17, 2012

Mac OS X Server 10.2: Tested and Theoretical Maximums (Limits)

The table below lists the tested and theoretical maximums (limits) for services offered by Mac OS X Server 10.2 or later.
This article has been archived and is no longer updated by Apple.
Note: Tested maximums reflect the test configuration and do not represent a guarantee of performance. Your experience may vary depending on factors such as computer model, microprocessor speed, network conditions, hard disk space, disk fragmentation, installed memory (RAM), client load, total number of services running on the server, or other software used on the server. Information left blank in the table is not yet available.

Tested and Theoretical Maximums

Component	Maximum	Tested	Theoretical
Core OS	Number of Open Files	1000	12288
AFP Server	Number of Connected Users	1000	N/A
User Accounts	User Comments Character Limit	54662	N/A
Directory Services	Number of Groups per User	16	16
Directory Services	Number of Groups	10000	
Directory Services	Number of Users	10000	
AFP Server	Shareable Volume Size	8 TB	8 TB
AFP Server	Number of Files per Volume	250 million	2 147 483 646
AFP Server	Number of Shared Items	255	255
Web Server	Number of Connected Users		2048
SMB Server	Number of Open Files	1000	12288
SMB Server	Number of Connected Users	1000	1000
Mail Server	Number of Incoming SMTP Connections		512
Mail Server	Number of Outgoing SMTP Connections		256
Mail Server	Number of POP Connections		1024
Mail Server	Number of IMAP Connections		1024
Mail Server	Maximum Size of Mail Database	128 GB	
Mail Server	Number of Messages in Mail Database	4 billion	
FTP Server	Number of Connected Users		16384
FTP Server	Maximun no. of Connections per User		16384
Web Server	Number of Open Files		12288
QTSS	Number of Connected Users per Streamed File		12288
QTSS	Number of Simultaneously Streamed Files		12288
QTSS	Number of Connected Users		12288
Print Server	Number of Queues	60	
Macintosh Manager Client	Number of Approved Desktop Printers Per Workgroup	5	10
NetBoot	Number of Clients Simultaneously Using NetBoot	50	
Mail Server	Number of Entries in SMTP Server Rejection List	128	N/A
Mail Server	Number of Entries in Approved SMTP Hosts List	128	N/A

Mac OS X Server 10.2: NetBoot/DHCP fails after making changes in Server Settings

NetBoot/DHCP fails after making changes in Server Settings, because bootpd does not get started.
This article has been archived and is no longer updated by Apple.

Symptom

NetBoot clients fail to startup from the server, and DHCP clients do not get an address.

Solution

This is because the bootps configuration file for xinetd may become damaged.

1. Log in to the server as root. If you need information on this step, see technical document 106290, "**Mac OS X: About the root User and How to Enable It**".
2. Open the file /etc/xinetd.d/bootps in your favorite editor. For help with this step, see technical document 106619, "**Mac OS X Server: How to Locate and Edit Configuration Files**". The file should contain the following text. If it does not, make it so.

```
service bootps
{
        disable      =    no
        socket_type  =    dgram
        wait         =    yes
        user         =    root
        server       =    /usr/libexec/bootpd
        groups       =    yes
        flags        =    REUSE
}
```

Published Date: Feb 17, 2012

Mac OS X: Some Mac OS X Applications and Services Require AFP 3.0 or Later When Using AFP Home Directories

Mac OS X applications may not work properly when using Apple Filing Protocol (AFP) home directories hosted by a server that does not have AFP 3.0 or later as a feature.
This article has been archived and is no longer updated by Apple.

Symptom

Classic unexpectedly quits while it is opening. Files may disappear in the Finder but are not actually deleted.

Solution

AFP 3.0 adds several features, including:

- file names longer than 31 characters
- works with volumes larger than 4 GB
- uses UNIX permissions

Many Mac OS X applications and services expect these features. These applications and services may experience unexpected behavior with earlier versions of AFP.

When accessing remote file services using AFP, an AFP server that includes AFP version 3.0 or later may be required for use with some Mac OS X applications and services.

Versions included by product

- Mac OS X Server 10.2 includes AFP 3.1
- Mac OS X Server versions 10.0.3 through 10.1.4 include AFP version 3.0
- Mac OS X Server 1.x includes AFP 2.2
- AppleShare IP includes AFP 2.2 and earlier
- Third-party AFP servers - see vendor documentation

Mac OS X Server: Offered DHCP Addresses Declined by the Client Are Not Reused

DHCP addresses that are offered by the DHCP server in Mac OS X Server and declined by the client are permanently removed from the pool.
This article has been archived and is no longer updated by Apple.

Symptom

The server no longer offers addresses, and Server Status shows leases with no time and other fields as "Not Available".

Solution

1. Use Server Settings to stop the DHCP server.
2. Delete the file: /var/db/dhcpd_leases
3. Use Server Settings to start the DHCP server.

Published Date: Oct 11, 2016

Mac OS X: How To Force a DHCP Lease Renewal

This document explains how to renew or acquire a new DHCP lease.
This article has been archived and is no longer updated by Apple.
Use the Network pane in System Preferences to deactivate then activate the network interface. This allows you to renew or acquire a new DHCP lease.

1. Choose Location from the Apple menu, and Network Preferences from the submenu.
2. Choose Network Port Configurations from the Show pop-up menu.
3. Deselect the checkbox for the network interface for which you need to renew the DHCP lease.
4. Click Apply.
5. Reselect the checkbox for the network interface.
6. Click Apply.
7. Quit System Preferences.

Note: If you use locations, you can automate these steps by simply toggling between locations. Create a location in which the affected network interface is inactive, then toggle between it and your normal location. For more information, see technical document 106653, "**Mac OS X: How to Use Locations**".

Mac OS X: Unexpectedly Displays Negative Image (White on Black, Reverse Type)

Your computer may display a negative image if someone or something presses many keys at the same time. This is a feature of Universal Access that lets you toggle the display between negative and positive image by pressing the Control-Option-Command-8 key combination.
This article has been archived and is no longer updated by Apple.

Symptom

Your see a negative image in the screen. Depending on system configuration, it may be black and white, such as that in Figure 1, or color negative, such as that in Figure 2.

Figure 1 Picture of black and white negative image display using Universal Access

Figure 2 Picture of color negative image display using Universal Access

Solution

You can toggle the display between positive and negative by using the Control-Option-Command-8 key combination. First, press and hold the modifier keys (Control, Option, Command). While holding the modifier keys, press 8.

The screen will go blank for a second and return in the opposite mode.

Mac OS X 10.2: Timbuktu Pro Does Not Work In Classic Environment

Timbuktu Pro for Mac OS 9 will not work in the Classic environment of Mac OS X.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to open Timbukto Pro, an alert box appears with this message:

> "Timbuktu Pro failed to load because your computer is trying to open it in the Mac OS X Classic environment."

Solution

Netopia makes different versions of Timbuktu for Mac OS 9 and Mac OS X systems. To use Timbuktu Pro on a computer that is started up from Mac OS X 10.2, you must use Timbuktu Pro for Mac OS X. If necessary, install the correct version. If you have both versions installed, be sure that you are using the correct version.

Contact Netopia (http://www.netopia.com) for additional information on obtaining a Mac OS X version of Timbuktu Pro.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Mac OS X 10.2, 10.3: Printer Sharing doesn‘t work immediately after computer name is changed

This article has been archived and is no longer updated by Apple.

If Printer Sharing is on and you change the computer name, print jobs sent from a client computer to the shared printer queue will fail until the sharing computer is restarted.

Note: This document applies to Mac OS X 10.2 through 10.3.9.

Any time you change the name of a computer that has printer sharing turned on, restart that computer as soon as possible. Print clients should reselect the printer in Printer Setup Utility or Print Center, checking for the new computer name in the Host column.

Tips

1. The computer name referenced in this document is the one defined in the Computer Name field of the Sharing preference pane.

2. Printer Setup Utility or Print Center is located in the Utilities folder, which is in the Applications folder.

3. To see the Host column in the Printer List window of Printer Setup Utility or Print Center, choose Columns from the View menu item, then select Host from the submenu.

Mac OS X: About Encrypted Disk Images

This document describes how to use encrypted disk images.
This article has been archived and is no longer updated by Apple.
Disk Copy (/Applications/Utilities/), or Disk Utility (/Applications/Utilities/) for Mac OS X 10.3 Panther, offers the option of using encrypted disk images. To learn how to create one, see technical document 107333, "**Mac OS X: How to Create Encrypted Disk Images**".

An encrypted disk image can be used like any other disk image file. It may be copied to or created on network volumes or removable media, including Zip drives, USB flash media, or FireWire hard drives. You should not create images directly onto CD-Rs or DVD-Rs, but encrypted disk images can be burned onto a CD-R or DVD-R for archival purposes.

Each encrypted disk image is protected by a password, which may be composed of 7-bit ASCII characters and 1 to 255 characters in length. For more information, see technical document 106521, "**Mac OS X: How to Choose a Secure Password**".

Warning: The encryption used is 128-bit, equivalent to that used in the banking industry. If you forget the password to your encrypted disk image, your data will be irretrievably lost. By default, the password is stored in your login keychain when you create an encrypted disk image. The keychain uses the same password that you use to log in to the system. You should use the keychain to store this password.

Notes

1. Backup programs will need to back up the entire image if any file stored within the image has changed, since the image appears as a single file.

2. There is no way to change the password on an image file.

3. An encrypted disk image cannot be used as your home directory.

Mac OS X 10.2: Classic Cannot Start If Disk Is Full

Classic may unexpectedly quit or issue an alert message during its startup if there is little or no free space available on the disk that contains the Mac OS 9 System Folder used by Classic.
This article has been archived and is no longer updated by Apple.

Symptom

Classic unexpectedly quits or issues an alert message during its startup.

Solution

Check the amount of free space available on the disk that contains the Mac OS 9 System Folder. If there is no (or very little) free space, copy or delete files from that disk to create more free space.

Note: Because of differences in the way that Mac OS 9 and Mac OS X use disk space, Mac OS 9 may report that there is space available on the disk when Mac OS X reports that it is full. You will need to ensure that Mac OS X reports free space in order to start the Classic environment.

Mac OS X 10.2.8 or Earlier: Cannot Drag Items From Classic Applications to Trash

Some applications that allow you to drag items to the Trash when the computer is started up from Mac OS 9 may not allow the same action when the application is open in the Classic environment of Mac OS X.
This article has been archived and is no longer updated by Apple.

Symptom

An item, such as a web browser bookmark or email attachment, is not deleted or removed when you drag it from a Classic application to the Trash icon in the Dock. Dragging items from the desktop or Finder windows to the Trash works correctly.

Solution

In Mac OS X 10.2 through 10.2.8, this issue will not occur if the Mac OS 9 System Folder used by Classic is installed on the same volume as Mac OS X.

In Mac OS X 10.0 and 10.1 (and Mac OS X 10.2 if Mac OS 9 is installed on a different volume), you will need to use an alternate method to delete the item. The method will depend on the application and the item you want to remove. For instance, for an email attachment you may need to locate the attached file in the Finder and drag it to the Trash from there. For buttons in the Mac OS 9 Launcher, you will need to open the Launcher Items folder inside the System Folder and drag the appropriate alias to the Trash.

Mac OS X 10.2: Sleep Is Delayed When You Close a PowerBook or iBook

If certain applications are open, there may be a delay of up to 30 seconds before your PowerBook or iBook goes to sleep after closing it.
This article has been archived and is no longer updated by Apple.

Symptom

A PowerBook or iBook using Mac OS X 10.2 does not go to sleep immediately when you close it.

Solution

Some applications may not respond immediately to system sleep notifications in Mac OS X 10.2. These applications should respond within several seconds, allowing the computer to go to sleep. However, this may cause a delay of up to 30 seconds after the computer is closed.

To avoid this delay, quit any such application before closing the computer. You may need to use a process of trial and observation to determine which applications cause a sleep delay.
Published Date: Feb 17, 2012

Mac OS X 10.2.8 or Earlier: Process Viewer Displays Incorrect "% Memory" Values if 2.0 GB of RAM Is Installed

Process Viewer displays incorrect "% Memory" values if 2.0 GB of RAM (random-access memory) is installed.
This article has been archived and is no longer updated by Apple.

Symptom

The Process Viewer application incorrectly displays zero (0.00) or negative (-0.??) "% Memory" values for processes if 2.0 GB of memory is installed in the computer.

Solution

This is a cosmetic issue only. It does not indicate any actual issue with the installed RAM or other computer hardware.

Alternatively, you may use the top Terminal command to get information on memory usage of processes. For more information on using top, execute "man top" in the Terminal (/Applications/Utilities/).

Mac OS X 10.2: Apple System Profiler Unexpectedly Quits

If Apple System Profiler unexpectedly quits ("crashes"), update to Mac OS X 10.2.4 or later.
This article has been archived and is no longer updated by Apple.

Symptom

Apple System Profiler opens for a few seconds, then unexpectedly quits.

Solution

Update to Mac OS X 10.2.4 or later.

Published Date: Feb 17, 2012

Mac OS X 10.2 or Earlier: Classic Application Won‘t Install When Installation Requires More Than One CD

If you are unable to install Classic application software because more than one installation CD is used, start up the computer from the Mac OS 9 System Folder before installation.
This article has been archived and is no longer updated by Apple.

Symptom

The second CD of a multiple-CD software installation is not recognized in the Classic environment, and the installation does not complete.

Solution

Start up from your Mac OS 9 System Folder before performing the installation. For more information, see technical document 106667, "**How to Switch Between Mac OS 9 and Mac OS X**".

Note: Some Macintosh computers start up only in Mac OS X. See technical document 86209: "**Macintosh: Some Computers Only Start Up in Mac OS X**". Contact the manufacturer of the multiple-CD software for Mac OS X compatibility information.

Mac OS X 10.2: Pasting Custom Icons Over Custom Icons Does Not Always Work

If you try to change the icon of an item that already has a custom icon, the icon you paste will not appear on the target item.
This article has been archived and is no longer updated by Apple.

Symptom

If you copy a custom icon and try to paste it into the "Get Info" window of an item that already has a custom icon, the new icon will not appear. You can delete the existing custom icon and try to paste the icon, but the previous custom icon will appear instead of the new one.

Solution

This document will be updated as more information becomes available.
Published Date: Feb 17, 2012

Mac OS X Server 10.2: How to Prevent Open SMTP Relay ("spam" Forwarding)

Mac OS X Server 10.2 Mail Service can be configured to prevent open SMTP relay while still allowing local users to send mail. This document explains how.
This article has been archived and is no longer updated by Apple.
Note: If you are using Mac OS X Server 10.1.3-10.1.5, stop here and see technical document 106762, "**Mac OS X Server 10.1: How to Set up Restricted SMTP Relay for Apple Mail Server**".

Getting started

If you are using Mac OS X Server version 10.2 to 10.2.3, you should update to version 10.2.4 or later. Important changes have been made to the way the Mail Service handles mail. All instructions in this document assume Mac OS X Server 10.2.4 or later. By default, the Mail Service is configured not to allow open relay and not to send email to the Internet outside of your domain. It will, however, accept mail for all local users from any sender. You may follow the steps below to expand email sending capability while still preventing open relay.

Phase I: Outgoing Mail

1. Open Server Settings and connect to the server.
2. Click the Internet tab.
3. Click the Mail Service button and choose Configure Host Settings (Mail Service must be running).
4. Click the Outgoing Mail tab.
5. Select Allow Outgoing Mail from the pop-up menu.
6. Click the Save button.

Now the Mail Service will allow the server to send mail to the Internet. It will also allow anyone who first authenticates using the CRAM-MD5 protocol to send mail to the Internet. It will still accept mail for local users from any sender.

Phase II: Restricting Outgoing Mail by IP Address or Range

If you would like to allow your users to be able to send mail to the Internet without authenticating, follow these steps.

1. Click the Incoming Mail tab in the Configure Host Settings window.
2. SMTP relay should be allowed for "only hosts in this list" by default. The loopback address (127.0.0.1) and the server's primary IP address are in the list by default.

Note: Do not remove the loopback address from the list. This is a special address and needs to be allowed to relay. Its presence does not present a security risk.

3. Click the Add button and add the IP addresses of any computers you wish to allow to send mail without authenticating. You can add an entire network by using an IP address/netmask format.

Examples:
To add 10.0.0.0 through 10.255.255.255, type: 10.0.0.0/255.0.0.0
To add 172.16.0.0 through 172.16.255.255, type: 172.16.0.0/255.255.0.0
To add 192.168.0.0 through 192.168.0.255, type: 192.168.0.0/255.255.255.0

4. Click the Save button and close the window.

Now the Mail Service will allow anyone connecting from an allowed IP address to send mail to the Internet. It will also allow anyone who first authenticates using the CRAM-MD5 protocol to send mail to the Internet. It will accept mail for local users from any sender.

Phase III: Outgoing Mail From Any Authenticated User

If you would like to allow users who are NOT in the list of allowed IP address to send mail to the Internet if they authenticate using ANY method, follow these steps.

1. Click the Mail Service button and choose Configure Mail Service.
2. Click the Protocols tab.
3. Click the SMTP Options button.
4. Select the "Require authenticated SMTP using CRAM-MD5" checkbox.

5. Select the "Allow PLAIN and LOGIN authentication" checkbox.
6. Deselect the "Require authenticated SMTP using CRAM-MD5" checkbox.
7. Click the Save button and close both windows.

Now the Mail Service will allow anyone connecting from an allowed IP address to send mail to the Internet. It will also allow anyone who first authenticates by any method to send mail to the Internet. It will accept mail for local users from any sender.

Notes:

1. CRAM-MD5 authentication requires a Password Server with CRAM-MD5 enabled and the individual users must be set to use Password Server passwords. The users must have a CRAM-MD5 (sometimes called MD5 Challenge-Response) capable mail application (such as Apple Mail) as well.

2. PLAIN and LOGIN may be enabled even when CRAM-MD5 authentication is not required (CRAM-MD5 is always enabled in the Mail Service, you can only require it or not require it). Most mail clients support PLAIN or LOGIN authentication.

Warning: PLAIN and LOGIN transmit the username and password in "plain text" format and pose a security risk. If possible, clients should be encouraged to use CRAM-MD5 instead.

Mac OS X 10.2: Rendezvous Name Fails to Save

If you include a period in the Rendezvous name for your computer, the system will not warn you that a period is an invalid character and will not save the new name.
This article has been archived and is no longer updated by Apple.

Symptom

You enter a Rendezvous name that includes a period in the Sharing preference pane. When you subsequently go to a different preference pane and then return to the Sharing pane, you discover the Rendezvous name was not saved.

Solution

Do not use a period in your Rendezvous name. To learn about creating a valid Rendezvous name, see technical document 106964, "**Mac OS X 10.2: About Your Computer's Rendezvous Name**".
Published Date: Oct 11, 2016

Mac OS X: Some Photoshop 6 Menu Items Do Not Appear

Some menu items may not appear if you open Adobe Photoshop 6 without first starting the Classic environment.
This article has been archived and is no longer updated by Apple.

Symptom

Some Photoshop menu items do not appear.

Solution

Start the Classic environment before opening Adobe Photoshop 6. You may start Classic in the Classic pane of System Preferences.
Published Date: Feb 17, 2012

Mac OS X Server: Users Cannot Log In to Windows File Sharing, Do Not Have tim_password Value in NetInfo

If the root password for the local and parent NetInfo domain are different when the Authentication Manager is in use, users in the parent domain will not have tim passwords set. This prevents users from logging in via Windows File Sharing.
This article has been archived and is no longer updated by Apple.

Symptom

Affected users are not able to log in via Windows File Sharing and do not have a tim_password value in NetInfo.

Solution

1. Connect to the server via Server Admin.
2. Click the General tab.
3. Choose the NetInfo/root domain from the Users & Groups menu.
4. Reset the users' passwords to create a tim_password value in NetInfo. You may do this either using a batch edit or one at a time.

Published Date: Oct 11, 2016

Mac OS X Server: How to Update an Existing NetBoot Image

This document explains how to update an existing NetBoot disk image.
This article has been archived and is no longer updated by Apple.
You can apply a Mac OS X system software update to an existing NetBoot image so that your clients start up from the latest software version. You may download updates from Apple Software Downloads (http://www.apple.com/swupdates/).

To update an image using these instructions, you must have been logged in to the server as the root user when you created the image.

Follow these steps:

1. Log on to the server as the root user. For help, see technical document 106290, "**Mac OS X: About the root User and How to Enable It**".
2. Open Server Settings.
3. Click the Network tab.
4. Choose Configure DCHP/NetBoot from the DHCP/NetBoot menu.
5. Click the Image tab.
6. Deselect the checkbox in the Enabled column for the image that you want to update.
7. In the Finder, locate the image (the image.dmg file in /Library/NetBoot/NetBootSPx/image.nbi).
8. Select the file, then choose Get Info from the File menu.
9. Deselect the Locked checkbox.
10. Using the same method, unlock the associated boot file (/Library/NetBoot/NetBootSPx/image.nbi/booter).
11. Double-click the image file to mount the image.
12. At this point, install the software update according to its instructions. Be sure to select the mounted NetBoot image as the destination disk for the update.
13. Open the Terminal (/Applications/Utilities/).
14. In this step, you will type a series of commands in the Terminal. Each command is preceded by the pound (#) sign. After typing each command, press Return. These commands update the boot files:

```
# cd /Library/NetBoot/NetBootSPx/image.nbi
# vsdbutil -a /Volumes/image
# kextcache -l -n -m mach.macosx.mkext /Volumes/image/System/Library/Extensions
# cp /Volumes/image/usr/standalone/ppc/bootx.bootinfo booter
# cp /Volumes/image/mach_kernel mach.macosx
```

15. In Server Settings, re-enable the NetBoot image.

Important software license information:

In accordance with the Network Install and Mac OS X Server software license agreements, you may use the software in this manner as long as you ensure that each end user of the image files is aware of and complies with the terms of the software license(s) that governs the use of the software contained within the image files. The Network Install and Mac OS X Server software may be used to install and reproduce materials so long as your use is limited to reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce.
Published Date: Oct 11, 2016

Mac OS X Server: How to create a customized NetBoot image

This document explains how to create a customized NetBoot disk image.
This article has been archived and is no longer updated by Apple.
You can move an image to a client computer, customize it, and return the image to the server. This is easiest if you copy the image to an external FireWire hard drive.

Follow these steps to customize a Mac OS X NetBoot image:

1. Log on to the server as the root user. For help, see technical document 106290, "**Mac OS X: About the root User and How to Enable It**".
2. If you don't already have an image to customize, create a new NetBoot image from a Mac OS X installer CD using the Network Image Utility on the server. To simplify later steps, avoid using spaces in your image name.
3. On an external hard drive, set up a 2 GB partition with the same name as the image.
4. If the image file (the image.dmg file at /Library/NetBoot/NetBootSPx/image.nbi) is locked, select it in a Finder window, choose Get Info from the File menu, and deselect the Locked checkbox.
5. Use the same method to unlock the booter file that is in the .nbi folder with the image.
6. Double-click the .dmg file to mount the image, then use a file utility (such as the shareware Carbon Copy Cloner) to copy the contents of the image to the empty partition on the external disk.
7. Move the external drive to a client computer and start the client from the image partition.
8. Customize the system to suit your users. For example, you may install additional applications, configure directory services, set up user accounts, or customize the Dock. You can also install a Mac OS X update to update the system software on the client.
9. When the client is properly configured, shut down the client computer and reconnect the external disk to the server.
10. Copy the contents of the customized partition from the external disk (using Carbon Copy Cloner, for example) back into the original image on the server (image.dmg in /Library/NetBoot/NetBootSPx/image.nbi, which should still be mounted).
11. Open the Terminal (/Applications/Utilities/).
12. In this step, you will type a series of commands in the Terminal. Each command is preceded by the pound (#) sign. After typing each command, press Return. These commands update the boot files:

```
# cd /Library/NetBoot/NetBootSPx/image.nbi
# kextcache -l -n -m mach.macosx.mkext /Volumes/image/System/Library/Extensions
# cp /Volumes/image/usr/standalone/ppc/bootx.bootinfo booter
# cp /Volumes/image/mach_kernel mach.macosx
```

13. Enable the image using Server Settings.

Important software license information

In accordance with the Network Install and Mac OS X Server software license agreements, you may use the software in this manner as long as you ensure that each end user of the image files is aware of and complies with the terms of the software license(s) that governs the use of the software contained within the image files. The Network Install and Mac OS X Server software may be used to install and reproduce materials so long as your use is limited to reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X Server: How to Create a NetBoot Image From an Existing System

This document explains how to create a NetBoot disk image from an existing system.
This article has been archived and is no longer updated by Apple.
If you already have a client computer set up to suit your users, you can use Disk Copy to create a NetBoot image that is based on that client's configuration. You need an external FireWire hard disk or a second partition on the client's hard disk on which to create the image. You cannot create the image on a volume over the network.

Follow these steps to create a NetBoot image based on an existing system:

1. Make sure there is a second volume available on the client where you can create the image. You can use an external disk (such as a FireWire hard drive) or any partition available on the client other than the startup volume.
2. Make sure that permissions are enabled on the target volume. See Section I of technical document **107524** for more information on enabling permissions for a volume.
3. Open Disk Copy at the client computer.
4. Choose New from the File menu, then New Image From Folder Or Volume from the submenu.
5. Select the client startup volume as the source of the image.
6. Click Image.
7. In the Image Volume panel, type an image name.
8. Choose the external disk or second partition as the destination.
9. Choose read/write from the Image Format pop-up menu.
10. Click Save.
11. Open the Terminal (/Applications/Utilities/).
12. Type this command, pressing Return afterwards:

```
kextcache -l -n -m /Volumes/target_volume/mach.macosx.mkext /System/Library/Extensions
```

Note: Replace "target_volume" with the actual name of the volume which was imaged.

13. On the server, create a new folder named "image_name.nbi" at /Library/NetBoot/NetBootSPx, replacing "image_name" with the actual name of your new image.
14. Copy the image.dmg and mach.macosx.mkext files that you created on the client into the new folder /Library/NetBoot/NetBootSPx/image.nbi.
15. You may now unmount the target volume (the volume which was imaged), if appropriate.
16. At the server, double-click the .dmg file to mount the image.
17. At the server, open the Terminal.
18. In these steps, you will type a series of commands in the Terminal. Each command is preceded by the pound (#) sign, which represents the prompt you see on screen. After typing each command, press Return.

```
# cd /Library/NetBoot/NetBootSPx/image.nbi
# cp /Volumes/image/usr/standalone/ppc/bootx.bootinfo booter
# cp /Volumes/image/mach_kernel mach.macosx
```

19. To set up the image property list file, open the Property List Editor.
20. Choose New from the File menu.
21. Click the New Root button.
22. Click the disclosure triangle next to the Root entry.
23. Click the New Child button to add the first property. To modify a property, double-click in a column or click the triangles to select a value from a pop-up list. After you create the first property, click the New Sibling button to add another.
24. Add all of these properties, classes, and values:
- BootFile, String, booter
- Index, Number, (a unique image index of your choice)
- IsDefault, Boolean, Yes or No
- IsEnabled, Boolean, No
- IsInstall, Boolean, No
- Name, String, (image name, same as name of .nbi folder and .dmg file)
- RootPath, String, (name of image file, including ".dmg" extension)
- Type, String, NFS

25. Save the file with the name "NBImageInfo.plist" in the image folder /Library/NetBoot/NetBootSPx/image.nbi. Instead of creating the file yourself, you can copy an existing NBImageInfo.plist file from another image (.nbi) folder and modify it using the Property List Editor.
26. Enable the image using Server Settings.

Important software license information

In accordance with the Network Install and Mac OS X Server software license agreements, you may use the software in this manner as long as you ensure that each end user of the image files is aware of and complies with the terms of the software license(s) that governs the use of the software contained within the image files. The Network Install and Mac OS X Server software may be used to install and reproduce materials so long as your use is limited to reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce.

Mac OS X Server: Creating a Network Install Disk Image

You can create installer images using the Network Image Utility, which is found on the Mac OS X Server Administration Tools CD that comes with Mac OS X Server. Look in the folder /NetBoot, Network Install/Image Creation. To create an image that includes system software, you need a Mac OS X install CD.
This article has been archived and is no longer updated by Apple.
Follow these steps to create an installer disk image:

1. Open Network Image Utility.
2. Click the lock button, and authenticate as an Admin user.
3. Type a name for the disk image you are creating.
4. Choose Network Install from the Image Type pop-up menu.
5. To create an image that is unique to this server, choose an ID in the range 1-4095. To create one of several identical images to be stored on different servers for load balancing, use an ID in the range 4096-65535. Multiple images of the same type with the same ID in this range are listed as a single image in a client's Startup Disk preference pane.
6. Choose the default language for the installed software.
7. Optional: To have the installation proceed with limited or no interaction from the client computer, select "Enable automated install of the image."
8. Click Create Image.
9. When prompted, insert a Mac OS X Installation CD.

The image (.dmg file) and associated files are saved on the server in the following location, where "x" is the volume number, and "image" is the image name you provided:

/Library/NetBoot/NetBootSPx/image.nbi

Important software license information

In accordance with the Network Install and Mac OS X Server software license agreements, you may use the software in this manner as long as you ensure that each end user of the image files is aware of and complies with the terms of the software license(s) that governs the use of the software contained within the image files. The Network Install and Mac OS X Server software may be used to install and reproduce materials so long as your use is limited to reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce.

Mac OS X Server: How to Add Packages to an OS Install Image

This document explains how to add packages to an operating system installer disk image.
This article has been archived and is no longer updated by Apple.
To include additional application or file packages in an operating system installer disk image, copy the packages into the image, and then use a text editor such as TextEdit to update the property list (.plist) file that describes the packages in the image.

Follow these steps to add packages to an OS installer disk image:

1. Make sure the disk image file (.dmg) is unlocked. If necessary, select the image file in the Finder and choose Show Info from the File menu. Be sure the Locked checkbox is not selected. You may need to log in as the root user to unlock the file.
2. Double-click the image file to mount it.
3. Copy your packages or metapackages into the following folder in the mounted image: /System/Installation/Packages
4. In the same folder, Control-click the OSInstall.mpkg file and choose Show Package Contents from the shortcut menu.
5. Open the Contents folder (inside OSInstall.mpkg).
6. Use a text editor to open the file Info.plist. To open the file in TextEdit, for example, drag the file's icon onto the icon for the TextEdit application.
7. Add a new <dict>...</dict> entry for your package within the array of entries under the key IFPkgFlagPackageList. You can copy one of the existing entries, then just change the value of the IFPkgFlagPackageLocation key to the name of the package you put in the Packages folder.
8. Repeat step 6 for each package you want to install.
9. Save the updated property list.
10. Eject the image.

Important software license information

In accordance with the Network Install and Mac OS X Server software license agreements, you may use the software in this manner as long as you ensure that each end user of the image files is aware of and complies with the terms of the software license(s) that governs the use of the software contained within the image files. The Network Install and Mac OS X Server software may be used to install and reproduce materials so long as your use is limited to reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce.

Mac OS X Server: How to Automate Installation of an OS Image

This document explains how to automate installation of operating system software onto a client computer from a Network Install disk image.
This article has been archived and is no longer updated by Apple.
To install Mac OS software (along with any packages you add) with limited or no interaction from the client computer, use the Network Image Utility to create an automated install image, then update the associated configuration file and enable the image.

Follow these steps to set up an OS image for automated installation:

1. Create a new image using the Network Image Utility. In doing so, choose Network Install as the image type, and select "Enable automated install of the image."
2. Mount the new image, which is located at /Library/NetBoot/NetBootSPx/image.nbi.
3. Open the file minstallconfig.xml using the Property List Editor. The file is in the mounted image, in the folder /private/etc.
4. Adjust the values in the minstallconfig.xml file to specify the details of the installation and determine whether any interaction will be required from the client. When you are finished, save your changes. See "About the minstallconfig.xml File" on page 551 of the Server Admin Guide.
5. Eject the image.
6. Enable the image in Server Settings.

The Server Admin Guide is available from technical document 50525, "**Mac OS X Server Manuals**".

Important software license information

In accordance with the Network Install and Mac OS X Server software license agreements, you may use the software in this manner as long as you ensure that each end user of the image files is aware of and complies with the terms of the software license(s) that governs the use of the software contained within the image files. The Network Install and Mac OS X Server software may be used to install and reproduce materials so long as your use is limited to reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce.
Published Date: Oct 11, 2016

Mac OS X Server: About the minstallconfig.xml File

This document explains the minstallconfig.xml file.
This article has been archived and is no longer updated by Apple.
Automated installations use information in this file to control how the installation proceeds. To set up a completely automated installation with no user interaction, for example, you need to make sure this file contains the information that a user of the client computer would otherwise provide. The minstallconfig.xml file is located in the installer image in /private/etc. You can use TextEdit or the Property List Editor to modify the file.

minstallconfig.xml Keys and Values

Key	Value	Description
InstallType	minimal	Installation proceeds without any interaction from the client.
InstallType	confirm	Someone at the client computer must respond to a confirmation dialog before installation can proceed.
Package	<path>	The path to the file that describes the packages to be installed. To automatically install an image that includes the operating system (with or without additional application packages), the path is /System/Installation/Packages/OSInstall.mpkg where pkgfile is the name of a package file (.pkg) in the case of a single package, or a metapackage file (.mpkg) if you are installing more than one package.
Target	<path>	The path to the location where the software will be installed. The default is /Volumes/Macintosh HD
Target	userselect	Prompts the user on the client computer to choose where the software will be installed.
Language	<code>	The two-letter ISO code for the primary language to be used by the installed software.
ShouldErase	true	The target volume is erased before installation proceeds.
ShouldErase	false	The target volume is not erased.
Restart	true	The client computer restarts when installation is finished.
Restart	false	The client computer does not restart after installation.

Mac OS X Server: How to Select a Network Install Image

This document explains how to select a Network Install disk image from the Mac OS X client computer on which you want to perform the installation.
This article has been archived and is no longer updated by Apple.
If the client computer is using Mac OS X version 10.2 or later, use the Startup Disk pane in System Preferences to select a NetBoot startup disk image.

Follow these steps to select a Network Install image from Mac OS X:

1. Open System Preferences.
2. Choose Startup Disk from the View menu.
3. Select the Network Install disk image you want to use to start up the computer.
4. Click Restart.

Mac OS X 10.2: Unresponsiveness if Network Disconnected While Connected to Shared Volume

The computer may temporarily stop responding, displaying a spinning disc pointer, if you are disconnected from the network while connected to a shared volume. This may happen if your Ethernet cable is loose, or if it is intentionally disconnected, for example.
This article has been archived and is no longer updated by Apple.

Symptom

The pointer turns into a spinning disc, and the computer is temporarily unresponsive. This message appears:

> "Disconnected The file server '<name of shared volume>' has unexpectedly closed down and reconnect has failed. <time stamp>"

Solution

1. Reconnect to the network. The spinning disc pointer may remain for a short time after the network is reconnected.
2. Reconnect to the shared volume, if possible. See Note, below.
3. If the spinning disc persists, restart the computer.

Note: If the network connection is working but you cannot connect to the shared volume, check with the administrator of the computer that is serving the shared volume.

Mac OS X: About the Mac OS X 10.2.4 Update

This software updates Mac OS X 10.2.3 to version 10.2.4.
This article has been archived and is no longer updated by Apple.
This information is available in:

Français | Deutsch | Español | Italiano | Nederlands | Svensk

Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X 10.2.4, you must enter the password for an Admin account. The password cannot contain a space or special characters typed by pressing the Option key

If you need to change an Admin account password, choose Apple menu > System Preferences, then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X 10.2.4.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Featured Software (http://www.apple.com/swupdates/).

There are two versions of the update installer available:

- Mac OS X 10.2.4 Update updates Mac OS X 10.2.3 to the new version. This document describes how to use this installer.
- Mac OS X 10.2.4 Update (Combo) updates Mac OS X 10.2, 10.2.1, 10.2.2, or 10.2.3 to version 10.2.4. If you need to use the Combo installer, see technical document 107363, "**Mac OS X: About the Mac OS X 10.2.4 Update (Combo)**".

Enhancements

Enhancements delivered with this update include:

Digital Hub and Audio Enhancements

- Further improves an enhancement introduced with Mac OS X 10.2.3, in which files and folders specific to Mac OS file systems are no longer copied to the disc when burning a CD.
- Improves audio quality for FireWire audio devices.
- Enhances support for mLAN devices.
- Adds support for LaCie d2 48x12x48x disc burners.
- Improves the way voice-activated applications work in Classic.
- Addresses an issue in which audio may not be sampled when using some Mac OS 9 audio applications in the Classic environment.

Printing Enhancements

- The Paper Size pop-up menu in the Page Setup dialog now has submenus if the selected printer has several margin settings for a paper size.
- Includes software for Brother printers that work with Rendezvous.
- Addresses a potential security issues with the CUPS printing software; for more information see technical document 61798 "**Apple Security Updates**."
- The Shared Printers list now appears by default in the "Format for:" pop-up menu in Page Setup dialog boxes.

Networking, Modem, and Internet-Related Enhancements

- You may turn on or off the ability to log into AFP servers using an Admin account password.
- Allows for use of a hardware Ethernet address with the ifconfig command in Terminal.
- Improves results when copying large files (4 GB or larger) to a Windows file sharing (SMB) server.
- Addresses an issue in which connecting to an AFP or other server could cause a Finder window to open displaying the contents of the Volumes directory, instead of the target volume.
- Addresses an issue in which the Web browser selection could unexpectedly change to a different browser after updating your default browser.
- Addresses a potential kernel panic situation when receiving a phone call on the same line that connects a DSL modem to the Internet.
- Includes sendmail version 8.12.6; for more information see technical document 61798 "**Apple Security Updates**."
- Dialing with the modem sound turned on produces sound on a portable computer.
- Rendezvous-enabled computers that have personal web sharing turned on appear in the Safari Rendezvous bookmark collection.

Address Book and Mail Enhancements

- Addresses a situation in which an application making use of Address Book could unexpectedly quit when certain text is deleted from the Show People search box.
- For German-localizations: addresses an issue in which sent messages in Mail may be deleted even if the "Delete sent mail when" preference setting is Never, except for sent messages transferred to a different mailbox.
- Address Book remains open after closing all of its windows.
- Address Book edit mode now includes an Undo feature.
- Resolves an issue that could occur when quitting Address Book after creating a new group.
- Improves Address Book formatting for Irish and Japanese addresses.

Finder Enhancements

- Addresses an issue that could occur when dropping items near the far left or top of the desktop in which existing item icons are "pushed away" from the dropped items.
- Resolves a situation in which the Finder could become temporarily unresponsive after closing a Get Info window.
- Improves behavior when pasting a custom icon over an existing custom icon.
- Dragging an alias from the preview column to the Trash no longer deletes the original item.
- Improves wording in the progress indicator window when copying a large file to an iDisk or WebDAV volume ("5 seconds remaining" could previously for much longer than five seconds).

Other Enhancements

- The Traditional Chinese Input Method now includes Hanin; using Hanin with either Zhuyinfuhao or Pinyin results in significantly more accurate typing.
- Reduces issues that could be caused by a damaged font within the Fonts folder of the System Folder used by the Classic environment, even if Classic is not running.
- Sherlock allows for typed selection of search results.
- Addresses an issue that could lead to a kernel panic when logging out.
- Addresses some situations in which Apple System Profiler 3.0 may unexpectedly quit.
- Addresses an issue in which the computer may not sleep when idle after disconnecting a FireWire or USB device.
- Selecting several items in a dialog list by Shift-clicking now works better in some Mac OS X (Carbon) applications.
- Turning on Folder Actions no longer results in increasing amounts of disk space being used.
- The Classic environment no longer draws the Mac OS 9 desktop picture on both monitors if you are using Display preferences to arrange your displays while Classic is starting.
- Addresses an issue in which the Classic environment could unexpectedly stop on a portable computer while the computer is in sleep mode and certain USB devices are attached.
- Resolves an issue in which System Preferences could unexpectedly quit if the Speech preference pane was open, Speakable Items was on, and sound was detected by the microphone.
- Improves compatibility with Firaxis Civilization III when the application's "Quartz text rendering" option is selected.

- The computer sleeps as expected if certain Ethernet cards are installed but the network port configuration is turned off in Network preferences.
- Addresses an issue with Disk Utility (10.3 v88.11), that could result in some disk repair utilities inaccurately finding issues with the "HFS wrapper" of a newly-formatted disk; the issue would not cause data loss.
- For Swedish-localizations, addresses an issue in which some advanced calculator conversions could result in zero.
- Reduces likelihood of a situation in which an inaccurate message, "You are now running on reserve battery power," may appear when waking an iBook or PowerBook.
- Includes Hiragino fonts version 7.11.
- Improves results when a large user dictionary is used with Kotoeri conversions.
- Addresses an issue in which, after using the Repair Disk Permissions feature of Disk Utility, Kotoeri stalls when the candidate window is shown.
- Improves support for USB-based MIDI devices in Classic.

Mac OS X: About the Mac OS X 10.2.4 Update (Combo)

This software updates Mac OS X 10.2, 10.2.1, 10.2.2, or 10.2.3 to version 10.2.4. It is a "combo" update that combines enhancements delivered with versions 10.2.1 through 10.2.4. If you already have Mac OS X 10.2.3, you may download a smaller update that is not a combo.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X 10.2.4, you must enter the password for an Admin account. The password cannot contain a space or special characters typed by pressing the Option key

If you need to change an Admin account password, choose Apple menu > System Preferences, then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X 10.2.4.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Featured Software (http://www.apple.com/swupdates/).

There are two versions of the update installer available:

- Mac OS X 10.2.4 Update (Combo) updates Mac OS X 10.2, 10.2.1, 10.2.2, or 10.2.3 to version 10.2.4. This document describes how to use this installer.
- Mac OS X 10.2.4 Update updates Mac OS X 10.2.3 to the new version. To learn more about that installer, see technical document 107362, "**Mac OS X: About the Mac OS X 10.2.4 Update**".

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with both Mac OS X 10.2.1, 10.2.2, and 10.2.3. These enhancements are listed individually in these technical documents:

107036: "**Mac OS X: About the Mac OS X 10.2.1 Update**"
107140: "**Mac OS X: About the Mac OS X 10.2.2 Update**"
107263: "**Mac OS X: About the Mac OS X 10.2.3 Update**"
107362: "**Mac OS X: About the Mac OS X 10.2.4 Update**"
Published Date: Oct 11, 2016

Mac OS X Server: About the Mac OS X Server 10.2.4 Update

This software updates Mac OS X Server 10.2.3 to version 10.2.4.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X Server 10.2.4, you must enter the password for an Admin account. The password cannot contain a space or special characters typed by pressing the Option key.

If you need to change an Admin account password, choose Apple menu > System Preferences, then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X Server 10.2.4.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Featured Software (http://www.apple.com/swupdates/).

There are two versions of the update installer available:

- Mac OS X Server 10.2.4 Update updates Mac OS X Server 10.2.3 to the new version. This document describes how to use this installer.
- Mac OS X Server 10.2.4 Update (Combo) updates Mac OS X Server 10.2, 10.2.1, 10.2.2, or 10.2.3 to version 10.2.4. If you need to use the Combo installer, see technical document 107365, "**Mac OS X Server: About the Mac OS X Server 10.2.4 Update (Combo)**".

Enhancements

This update delivers many enhancements, as described below.

Workgroup Manager / Client Management

- User list display performance enhanced, especially when displaying large lists of users.
- Improved managed client login performance and reliability.
- Management of Mac OS X preferences can be disabled by someone with a local Admin account on a client computer by removing the Directory Services binding using the Directory Access application.
- When the root user logs in on a managed client computer, management is disabled for the duration of the login.
- "Other . . ." user now appears in the Login Window of a client computer when the computer is configured such that no valid users would otherwise appear in the user's list.
- Preference allowing you to "limit search results to x records".
- Preference allowing you to "search for all on empty search key" .

Server Status

- Server Status provides more accurate graphic representation of Server CPU Usage and Network Traffic over time.

Web Server

- New Apache authentication module (mod_auth_digest_appl) handles digest authentication for WebDAV via DirectoryServices.
- Ability to process Rendezvous directives to Web server. This allows Safari users to browse for websites on a local subnet using the Rendezvous pop-up menu in Safari.

Netboot / Network Install

- The Network Image Utility is capable creating disk images with up to 10 GB of storage. This feature gives administrators the ability to image DVD content. Disk Utility is required to create images larger than 10 GB for use with NetBoot and Network Install. Netboot and Network Install images larger than 2 GB require Mac OS X 10.2.3 or later.

QuickTime Streaming Server

- QuickTime Streaming Server has been enhanced to provide greater security.

File Services: Apple (AFP), Windows (SMB), NFS, and FTP

- SMB: Improved handling of file copies larger than 4 GB to and from SMB share points.
- Enhanced NFS export to a specific subnet, in addition to World or Client IP list.
- The Inherit Permissions feature of Workgroup Manager copies execute bits from parent directories, if selected.
- Improves ability to save existing Microsoft Word files located on a Windows 2000 server share point.
- Improves ability to save Microsoft Word files on a Mac OS X Server share point, which sometimes resulted in the message "Word could not read from disk".
- Addresses issue in which clients using the LDAP plug-in and an "Authentication" search policy other than "Automatic" results in auths failure for AFP connections.
- Addresses issue in which trying to copy files to an auto-mounted group drop box results in the message "The operation cannot be completed because you do not have sufficient privileges for some of the items". (Managed Mac OS X clients were more likely to encounter this symptom.)
- Addresses issue in which AFP client cannot connect to Windows 2000 SFM "password protected" volumes. This issue could have resulted in a dialog requesting a "volume password," followed by a failure to connect to the selected volume.
- Better handling of Finder Comments field when using the Get Info command on any file or folder, allowing workflow and other applications using this information to perform normally.
- Addresses issue in which connection from a client to users' home directories can be broken if ejecting (unmounting) a second share point of the same server.
- Improves Finder experience when remotely viewing contents of folders in which filenames are being edited by two or more users over an AFP connection.
- Improves Finder experience when remotely viewing contents of a folder hosted on a uShare AFP volume.

Print Server

- Improved Print Queue performance when printing multiple jobs.
- Integrated latest LaserJet 4 Series of PPDs, providing improved compatibility.

Mail Server

- Sendmail has been updated to version 8.12.6.
- Improved support for Kerberos authentication via SMTP.
- Improved support for alternate locations of the mail database file; changes can be made in Server Settings.

X Serve

- if the security lock on X Serve is engaged, X Serve drives will not unmount when the drive handle is pressed. The drive indicator lights will remain green and drive operation should not be affected.

Networking

- Mac OS X Server version 10.2.4 supports jumbo Ethernet frames (MTU up to 9 KB) on Xserve when used with supported PCI gigabit Ethernet cards.

Mac OS X Server: About the Mac OS X Server 10.2.4 Update (Combo)

This software updates Mac OS X Server 10.2, 10.2.1, 10.2.2, or 10.2.3 to version 10.2.4. It is a "combo" update that combines enhancements delivered with versions 10.2.1 through 10.2.4. If you already have Mac OS X Server 10.2.3, you may download a smaller update that is not a combo.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X Server 10.2.4, you must enter the password for an Admin account. The password cannot contain a space or special characters typed by pressing the Option key.

   If you need to change an Admin account password, choose Apple menu > System Preferences, then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X Server 10.2.4.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Featured Software (http://www.apple.com/swupdates/).

There are two versions of the update installer available:

- Mac OS X 10.2.4 Server Update (Combo) updates Mac OS X Server 10.2, 10.2.1, 10.2.2, or 10.2.3 to version 10.2.4. This document describes how to use this installer.
- Mac OS X Server 10.2.4 Update updates Mac OS X Server 10.2.3 to the new version. To learn more about that installer, see technical document 107364, "**Mac OS X Server: About the Mac OS X Server 10.2.4 Update**".

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with both Mac OS X Server 10.2.1, 10.2.2, 10.2.3, and 10.2.4. These enhancements are listed individually in these technical documents:

107038: "**Mac OS X Server: About the Mac OS X Server 10.2.1 Update**"
107142: "**Mac OS X Server: About the Mac OS X Server 10.2.2 Update**"
107265: "**Mac OS X Server: About the Mac OS X Server 10.2.3 Update**"
107364: "**Mac OS X Server: About the Mac OS X Server 10.2.4 Update**"

Mac OS X 10.2: Windows File Sharing Does Not Start Without Network Connection

Windows file sharing does not start if the computer is not connected to a network. You should restart if sharing is on when a network cable is disconnected.

This article has been archived and is no longer updated by Apple.

Symptom

Windows file sharing does not start when the computer is not connected to a network.

Solution

1. Make sure that the computer is connected to a network, such as an Ethernet network.
2. Turn on Windows File Sharing in the Sharing preference pane (Services tab).
3. If Windows File Sharing does not start, restart the computer.

If Windows File Sharing still does not start, there may be an issue with your network cable or other network hardware. Contact your network administrator for assistance if needed. For general network troubleshooting information, see technical document 106796, "**Mac OS X: Internet and Network Topics (Getting Connected, Troubleshooting)**".

Published Date: Feb 17, 2012

Mac OS X 10.2: Personal File Sharing Stops When Not Connected to Network

Personal file sharing stops if the computer is not connected to a network during startup.
This article has been archived and is no longer updated by Apple.

Symptom

Personal file sharing stops if the computer is not connected to a network during startup.

Solution

1. Make sure that the computer is connected to a network, such as an Ethernet network or the Internet.
2. Turn on Personal File Sharing in the Sharing preference pane (Services tab).
3. If Personal File Sharing will not start, restart the computer.

For general network troubleshooting information, see technical document 106796, "**Mac OS X: Internet and Network Topics (Getting Connected, Troubleshooting)**".

Mac OS X 10.2 or later: Alert Message When Using the Connect to Server Command With HTTP Server

You can use an http URL (a Web address starting with "http://") in the Connect to Server dialog if the target server uses WebDAV. If you specify a URL to a server that does not use WebDAV, you see an alert message
This article has been archived and is no longer updated by Apple.

Symptom

When you try to open an http connection in the Connect to Server dialog, an alert with this message appears:

Mac OS X 10.2:

> "An error has occurred (error = -36)."

Mac OS X 10.3:

> "You cannot connect to this server because it cannot be found on the network. Try again later or try a different URL."

Solution

Connect to Server is only appropriate for http servers that use WebDAV. When connecting to one, be sure to include the desired share point, such as:

http://idisk.mac.com/username/

To connect to a Web server that does not use WebDAV, use a Web browser instead.

AirPort Extreme: Compatibility with earlier AirPort and third-party wireless products

You can use an AirPort Extreme card or base station seamlessly with existing AirPort and third-party 802.11b wireless products.
This article has been archived and is no longer updated by Apple.

Choosing an AirPort card

Because the card slots are different types, AirPort-capable computers use either the AirPort Card or the AirPort Extreme Card. The computer's listed specifications, as at the Apple Store, will name the card used. Computers described as "AirPort Extreme ready" accept the AirPort Extreme Card. Computers labeled as "AirPort ready" accept the AirPort Card. Both cards are available at The Apple Store.

Joining an AirPort Extreme network

Any computer using the earlier AirPort Card can connect to an AirPort Extreme Base Station. Any third-party 802.11b wireless card or adapter that works with an earlier AirPort Base Station should also be able to connect to the AirPort Extreme Base Station.

Joining AirPort and third-party 802.11b networks

Any computer using an AirPort Extreme Card can connect to an earlier AirPort Base Station. The AirPort Extreme Card can connect to the same third-party 802.11b wireless access points that the earlier AirPort Card connects to.

Mixing clients on an AirPort Extreme network

When you mix 802.11b (AirPort) and 802.11g (AirPort Extreme) clients on an AirPort Extreme network, each type of client receives an appropriate data throughput rate. The 802.11g clients continue to receive data at a higher rate than 802.11b clients.

Mac OS X: Unable to Print to Some Postscript IP Printers

Your print job may not be printed on certain IP Postscript printers when "Use default queue on server" is selected in Print Center and the printer's firmware does not specify a default queue.
This article has been archived and is no longer updated by Apple.

Symptom

When adding a printer in Print Center, you select "Use default queue on server". If this is selected for certain printers, you cannot print to them.

Solution

1. Open Print Center (/Applications/Utilities/).
2. Select the printer's queue.
3. Choose Printer > Delete Printer.
4. Click Add.
5. Select the connection type IP Printing.
6. Enter the printer's IP address or DNS name.
7. Instead of selecting "Use default queue name on server", enter a known good queue for the printer. Refer to your printer's owner's manual for the list of proper IP or LPR queue names.

Note: Most IP printers do not require that a default IP/LPR queue name be specified. However, with printers that have no default queue name specified in firmware, you must correctly specify the queue name to print over IP.

Mac OS X 10.2 (Japan): Kotoeri Stalls When Candidate Window Is Shown

After using the Repair Disk Permissions feature of Disk Utility, Kotoeri stalls when the candidate window is shown.
This article has been archived and is no longer updated by Apple.

Symptom

After typing Japanese text and pressing the space key to show the candidate window, Kotoeri stalls.

Solution

Update to Mac OS X 10.2.4 or later, then use the Repair Disk Permissions feature.

Published Date: Oct 11, 2016

Mac OS X 10.2: About Languages and Input Methods

Mac OS X 10.2 is a multilingual operating system. You may choose one of several languages for application menus and dialogs. In addition to these base languages, it is also possible to read and write text in several other languages.
This article has been archived and is no longer updated by Apple.

Languages included

Mac OS X 10.2 can display Finder menus, System Preferences, and file names in the following languages:

- Chinese (Simplified and Traditional)
- Danish
- Dutch
- English
- Finnish
- French
- Korean
- German
- Italian
- Japanese
- Norwegian
- Portuguese
- Spanish
- Swedish

You may select and prioritize languages in the System Preferences application. Go to the International pane, and (if necessary) click the Language tab.

Names of certain system-installed items will be translated into the selected language. Your home directory, for example, and its immediate subfolders (such as Music and Documents) appear with localized names when one of the above languages is selected as the preferred language. Folders that are not system installed retain their English names. You may rename user-created folders as desired, but you should not rename folders that were created by the system or by other applications that retain their English names. Examples of folders you should not rename are found at ~/Library and ~/Library/Preferences/.

After clicking the Language tab, you may also find more localization options (Script and Behaviors).

Selecting a keyboard layout or input method

To type text in a given language, you may need to select a keyboard layout or input method for it. Click the Input Menu tab of the International preference pane to locate these options. Keyboards layouts designated as Unicode are only available for Unicode applications such as Mail, TextEdit, or the Finder.

Application awareness, fonts, and language support

Some applications display text in these languages automatically, while others require that you select the text and use a special font for the language. The additional Asian and Western Language fonts are available on the Mac OS X 10.2 Install disc.

In the Finder of Mac OS X 10.2 or later, the Get Info command provides information about an application's language support. In the Info window, click the Languages disclosure triangle to see a list of available languages for the selected application. For help, see technical document 106148, "**Mac OS X: About Show Info, Get Info, and the Inspector**".

Unicode input methods

Mac OS X 10.2 includes several Unicode input methods:

- Arabic
- Croatian
- Devanagari
- Devanagari--QWERTY
- Greek
- Gujarati
- Gujarati--QWERTY
- Gurmukhi
- Gurmukhi--QWERTY

- Hawaiian
- Hebrew
- Icelandic
- Persian
- Romanian
- Slovenian
- Thai
- Thai--PattaChote
- U.S. Extended
- Unicode Hex Input
- Vietnamese

To select the language you want to use, click the Input Menu tab in the International preference pane, then select the checkbox next to the language. When more than one language is selected, the Input menu appears in the menu bar to the right of the Help menu. The Input menu is represented by a flag or other symbol that is associated with the selected language or input method. This menu allows you to quickly switch between active languages.

If the application does not support Unicode input, the languages are dimmed in the Input menu.

The Character Palette, also available from the Input menu, is a floating window utility to help you input difficult-to-remember or difficult-to-reproduce characters.

Localized or Dvorak keyboard configurations not available when started from Install CD (Mac OS X 10.2, 10.3, 10.4)

This article has been archived and is no longer updated by Apple.

When started up from a Mac OS X Install disc, localized and Dvorak keyboard configurations are not available when using Installer's Disk First Aid or the password reset features.

Text input does not yield the expected results when using Disk Utility or password reset features while started up from CD.

When starting up from a Mac OS X 10.2, 10.3, or 10.4 Install disc, the Mac OS X Installer is limited to the U.S. English keyboard layout.

Text entry will be via the US English keyboard layout instead of the expected localized keyboard layout. This means that you will not see expected text when trying to rename an erased volume in Disk Utility (except 10.4) or when trying to change your password.

Mac OS X 10.4 tip: While started from a Mac OS X 10.4 Tiger install disc, you can use localized and Dvorak keyboard configurations in Disk utility.

Mac OS X 10.2, 10.3: How to perform Mac OS 9 clean installation with Restore CDs

This article has been archived and is no longer updated by Apple.

This document explains how to perform a clean installation of Mac OS 9.2.2 using the Software Restore CDs included with computers that come with Mac OS X 10.2 or 10.3 (in which Mac OS 9 is installed from Mac OS X Restore CDs and there is no separate Mac OS 9 CD included with the computer).

Tip: Click here for more information about what a clean installation is and when you might need to perform it.

How to perform a Mac OS 9.2.2 clean installation using Mac OS X 10.2 or 10.3 Panther Software Restore CDs:

1. For Mac OS X 10.3 or later, open Disk Utility, then, from the **File** menu, choose **Fix OS 9 Permissions**. For Mac OS X 10.2.8 or earlier, locate and change the permissions settings of the Mac OS 9 System Folder so that you own it.
2. Open the Mac OS 9 System Folder, create a new empty folder, and drag the Finder into it.
3. Rename the Mac OS 9 System Folder to something such as "Former Mac OS 9 System Folder". **Tip:** Do not use "Previous System Folder".
4. Open Software Restore, and select to restore only Mac OS 9.
5. Open Classic preferences and verify that System Folder (the one that was just installed) is selected for the Classic environment.

When you are finished moving any items from the "Old Mac OS 9 System Folder," (such as preference files for Classic applications, unless "Use preferences from home folder" is selected in the Classic preference pane) it can be deleted.

Mac OS X: How to View a File‘s Path

This document explains how to view a file's path.
This article has been archived and is no longer updated by Apple.
There are several ways to view the hierarchical path to a particular file. Use any of these:

- Set the Finder window view to Columns, and read the path from left to right.
- Select the item in the Finder, then Command-click the icon of the enclosing folder that appears in the window's title bar.
- In Mac OS X 10.1 and later, you may choose Customize Toolbar from the View menu in the Finder, then add the Path button to your toolbar.

Note: The icon for the toolbar Path button suggests the path will be presented top to bottom. The path will actually be presented bottom to top (upside down). This is expected behavior. The same is true when Command-clicking the title bar of the Finder window.

Mac OS X: How to Move or Close an Inactive (Background) Window

You can use Command-drag and Command-click to move or close an inactive (background, dimmed) window.
This article has been archived and is no longer updated by Apple.

Mac OS X native windows

To close an inactive window without bringing it to the foreground, Command-click the Close Window button.

To move an inactive window, Command-drag the window's title bar.

Note: "Command" refers to the key on your keyboard that is marked with an Apple icon.

Classic environment windows

You can use the above commands for Classic windows while in the Classic environment, or for native Mac OS X windows while in the Classic environment.

However, if you are not in a Classic application, Command-clicking or dragging a background Classic window will make the window active (bring it to the foreground).

About SMTP

SMTP is the Simple Mail Transfer Protocol.

This article has been archived and is no longer updated by Apple.

SMTP stands for the Simple Mail Transfer Protocol, used to send electronic mail from your computer through an SMTP server, which is usually operated by your Internet service provider or network administrator. When configuring or troubleshooting Internet email, SMTP may also be referred to as "outgoing email" or "sending email."

SMTP is an industry standard protocol that allows different companies' products to work together.

The SMTP protocol is described in depth in RFC document number 821 (http://www.ietf.org/rfc/rfc0821.txt).

Mac OS X: Cannot print, use Classic, start file sharing, burn discs, or update software if /tmp missing

This article has been archived and is no longer updated by Apple.

If you start up the computer from Mac OS 9, certain items are visible in the Mac OS 9 Finder that are normally invisible in the Mac OS X Finder, including "/tmp" (which looks like a folder). Don't throw "/tmp" out!

What might happen in Mac OS X if the "/tmp" symbolic link is missing? Lots of things:

- Classic won't start.
- Attempts to print fail, with the alert message "error while printing".
- Software Update fails, with the alert message "An unexpected error has occurred".
- File sharing will not start.
- You cannot burn CDs or DVDs in Mac OS X 10.3.9 or earlier, the message "Burning a disc cannot proceed because the startup disc is full (Error code -34)" appears.
- A PPP dial-up connection attempt fails, with the alert message "An incorrect PPP option has been set".
- Repair Privileges Utility (Mac OS X 10.1.5 only) unexpectedly quits.

To avoid these issues, you guessed it, you shouldn't delete the /tmp symbolic link from the Mac OS X volume.

If /tmp is missing, it's easy to make a new one by following these steps:

Mac OS X 10.3 or later

Recreate the missing /tmp link by using the Disk Utility application to repair permissions on your Mac OS X startup volume.

Mac OS X 10.2.8 or earlier

1. Open Terminal (/Applications/Utilities/).
2. Type: `ls -la / | grep tmp`
3. Press Return.
4. Look at the resulting text. If it matches the following line (which would indicate that /tmp is still present) then this document does **not** apply to you, and you should stop here and try another troubleshooting path.
   `lrwxrwxr-t 1 root admin 11 Jan 15 11:00 tmp@ -> private/tmp`
   The timestamp following "admin" will reflect the current date.

5. If you do not see the line above, then type:
   `sudo ln -s /private/tmp /tmp`

6. Press Return.
7. Enter your administrator account password when prompted, the press Return.

Tip: If you have Safari 1.0 Beta (v48), update to Safari 1.0 or later to reduce the chances of this issue recurring. Choose **About Safari** from the **Safari** menu to see which version you have.

Mac OS X 10.2: Classic Issues Persist After Mac OS 9 Clean Installation

If you perform a Mac OS 9 clean installation after having selected the "Use preferences from home folder" option in the Classic preference pane, the Classic preferences and other items remain in your home directory after the clean installation. This means that any issues related to the retained files may persist after clean installation.
This article has been archived and is no longer updated by Apple.

Symptom

A clean installation does not resolve a Classic (Mac OS 9) issue that you would normally expect it to resolve. This occurs specifically after having selected the "Use preferences from home folder" option in the Classic preference pane. If you are not familiar with this option, see technical document 107398, "**Mac OS X 10.2: About the Classic 'Use preferences from home folder" Feature**".

Note: If you have not used the "Use preferences from home folder" feature, then this document does not apply to you.

Solution

A clean installation does not affect files copied to a user's home directory by the "Use preferences from home folder" feature. Rather, the clean installation only affects the Mac OS 9 System Folder. This means issues caused by files in the home directory will persist so long as the "Use preferences from home folder" is selected. You may troubleshoot the issue by following these steps:

1. Open System Preferences, and choose View > Classic.
2. Click the Start/Stop tab, and look for bold text that says Classic is "running" or "not running."
3. You want to be sure Classic is not running. If it is running, click the Stop button.
4. Click your desktop.
5. Choose File > New Folder.
6. Give the new folder a name such as "Previous Mac OS 9 Items".
7. Choose Go > Home.
8. Open your Library folder, then open the Classic folder that is inside it. (Your current path is: ~/Library/Classic/).
9. Move all the contents of this Classic folder into the folder you named in Step 6.
10. Go back to System Preferences and click the Start button to start Classic. A dialog asks if you want to populate the folder you just emptied with files from the Mac OS 9 System Folder.
11. Click OK. Items are copied from the cleanly installed System Folder, and folders reappear at ~/Library/Classic/.
12. Once Classic starts, check to see whether the issue persists. If it does, you may have an application-specific issue, and you need to reinstall the application.

If you wish to restore items removed in Step 9, you should do so a few at a time, to isolate the issue. In general, you should not replace "clean" system software items with prior ones. For example, do not replace the newly-copied Chooser with the Chooser from your "Previous Mac OS 9 items" folder.

Once the issue is resolved and all desired items are restored from the "Previous Mac OS 9 items" folder, the "Previous Mac OS 9 items" folder can be deleted.
Published Date: Oct 7, 2016

Mac OS X: About the Classic "Use Preferences From Home Folder" Feature

The Classic environment of Mac OS X 10.2 or later offers a customized experience, similar to Multiple Users in Mac OS 9. This means, for example, that each user in Classic could have their own Favorites in a Classic application.
This article has been archived and is no longer updated by Apple.
In the Advanced tab of the Classic preference pane, you can select the "Use preferences from home folder" option. When selected, several types of Classic-related preferences and items are stored in each Classic user's home directory. A major advantage of this is that each Mac OS X user can have customized Classic settings, such as:

- Control panel settings
- Favorites
- Application preferences (such as Web browser bookmarks)

The first time Classic starts after this option is selected, you are asked:

> "Would you like the contents of these folders copied from your Classic system folder?"

This is asking if you want to copy Preferences (and other folders) from the Mac OS 9 System Folder to your home directory. The process of copying may require a few minutes, and there is no indication of progress. Classic will continue to start when this is finished.

For a more detailed explanation of this feature, including how it relates to Mac OS X Server, see technical document 107184, "**Mac OS X 10.2: About Multiple Users Features in Classic**".
Published Date: Oct 7, 2016

Mac OS X Mail: How to Turn On or Off HTML Rendering

This document explains how to enable or disable HTML rendering of images or embedded objects in Mail (a spam prevention technique).
This article has been archived and is no longer updated by Apple.
Note: This document discusses Mail, an application included with Mac OS X. The same concepts apply to other email applications you may use, though the steps may differ.

Follow these steps to turn on or off HTML rendering, as desired:

1. Open Mail.
2. Choose Mail > Preferences.
3. Click the Viewing icon in the Preferences window.
4. Select or deselect (as desired) the checkbox for "Display images and embedded objects in HTML messages".

For more related information, including how HTML email messages relate to spam, see technical documents:

107399: "**Mac OS X Mail: How to Delete Multiple Messages Without Viewing Them First**"
107401: "**Mac OS X Mail: How HTML Email Messages Relate to Unsolicited Commercial Email**"
Published Date: Feb 17, 2012

Mac OS X Mail: How HTML Email Messages Relate to Unsolicited Commercial Email ("spam")

Rendering an HTML email message may verify your email identity to a legitimate or illegitimate sender, such as a sender of unsolicited commercial email (a "spammer").
This article has been archived and is no longer updated by Apple.
Note: This document discusses Mail, an application included with Mac OS X. The same concepts apply to other email applications you may use.

Background concepts

The pages you view in a Web browser are most often written at least in part in hypertext markup language (HTML). On an HTML Web page, you most often see two types of content placed by the page author: text and images.

The text is actually contained in the HTML, but the images are not. Rather, the page author places a text link that loads the image file from a different location. Your Web browser loads the text portion first, then subsequently sends a request for the images, which are loaded afterwards.

Because modern email applications can receive HTML-formatted email messages, you should be aware that your email application sends the same type of outgoing requests for images that are made by your Web browser. This feature is often referred to generically as "HTML rendering". In Mail Preferences, this option is labeled "Display images and embedded objects in HTML messages".

How viewing HTML messages relates to spam

There are both advantages and disadvantages to having HTML rendering turned on in Mail or any other email client application. You should consider these when evaluating your personal preferences. The advantage is that you will be able to see HTML-formatted email as the sender intended. When this is from someone you know or another legitimate source, this is aesthetically desirable and provides a better user experience.

However, spammers can use HTML mail to easily verify that your email address is valid, which is a disadvantage. This is often done by embedding your email address in the HTML links (particularly for graphics). When your mail application connects to the Internet to load graphics from the spammer's Web site, the spammer can log your address as "known good." Here is an example of how your email address may be embedded in a link:

> http://example.com/bizarre-x-html/yourname=apple.com/spamsite.html

In this example, a spammer working for example.com is attempting to verify the address "yourname@apple.com". This is one common example of the syntax used, and many other variations are possible.

Since spammers often start with randomly generated email addresses, verification of your address means that you may receive even more spam after knowingly or unknowingly loading such links. If you use the Mail spam filtering feature, this may not be of great concern to you.

However, if you prefer to tightly control your email address, turning off HTML rendering can be a good idea. If the HTML is not rendered, then no request is sent to the spammer when viewing the mail.

A middle ground solution is to leave rendering on but not use the preview pane, because the outgoing request that transmits your email address to the spammer is not sent until you view the message. Thus with the preview pane off, you may delete the message without verifying your address to the spammer. In this manner, you can still enjoy HTML rendering in messages from legitimate sources.

If you choose to turn off HTML rendering, beware that clicking any link in the unrendered message may compromise your identity. When viewing a spam message, do not click on any link that contains any portion of your email address. If the link appears to include encrypted data (looks like random characters), this could also be your email user name.

To learn more (including how to turn off the preview pane), see these technical documents:

107399: "**Mac OS X Mail: How to Delete Multiple Messages Without Viewing Them First**"
107400: "**Mac OS X Mail: How to Turn On or Off HTML Rendering**"

Mac OS X: How to Find Background Applications

This document discusses how to find background applications, those that do not appear in the Dock or Force Quit dialog. These applications are also known as "processes" or "daemons."
This article has been archived and is no longer updated by Apple.
A background application is one that runs without appearing in the Dock or Force Quit window. It can sometimes be useful to look for a specific background application when troubleshooting. Follow these steps:

1. Open the Activity Monitor (/Applications/Utilities/).

   Tip: Before Mac OS X 10.3, this utility was named Process Viewer.

2. Choose All Processes from the Show pop-up menu.
3. Locate the background application (by name or percentage of time being used).

For Activity Monitor, the process' identification number (PID) appears in the main window. If you need the PID when using Process Viewer, follow these steps:

1. Select the process from the listing.
2. Click the disclosure triangle labeled More Info, which is near the bottom of the window.
3. Click the Process ID tab.

Process ID appears in the first line. It should be a whole number that is positive.

Note: Do not confuse the "parent process id" or "process group id", which are different numbers.

The PID is necessary for the terminal commands sample and kill, among others.

Mac OS X 10.2: Internet Sharing Off After a Computer Restart

Internet Sharing is turned off (stopped) when the computer shuts down or restarts. You must start it each time the computer is restarted.
This article has been archived and is no longer updated by Apple.

Symptom

After restarting a computer that is sharing its Internet connection, its clients are no longer able to connect to the Internet. If you go to the Sharing preference pane, you see "Internet Sharing Off."

Solution

You must manually start Internet Sharing after a restart.

This document will be updated when more information becomes available.

Mac OS X 10.2: Sherlock Yellow Pages Search Fails

When using the Sherlock Yellow Pages channel, a search fails if you do not search with both a city and a state.
This article has been archived and is no longer updated by Apple.

Symptom

When searching with the Sherlock Yellow Pages channel, the message "- no items found -" appears in the search results window.

Solution

Be sure to include both the city and state, or the zip code, in the "City & State or Zip" search field. The issue occurs only when a city without a state is entered in this field.

If the issue persists, verify the spelling of the search terms that you are using.

Mac OS X Server 10.2: Server Monitor Indicates Journaled RAID Volume Is "Degraded"

Server Monitor may erroneously indicate that a RAID volume is "degraded" when the volume is being journaled.
This article has been archived and is no longer updated by Apple.

Symptom

When checking drives in Server Monitor, a drive's status is reported as "degraded."

Solution

If you see the "degraded" status, you should use Disk Utility to verify whether the RAID has any actual issues. If Disk Utility reports that there are no issues, you may safely ignore the "degraded" status.

Mac OS X: Interruption of Server Connection Can Cause Computer to Stop Responding

If connectivity to a Windows (SMB), NFS, or WebDAV shared volume is interrupted, the computer may stop responding ("hang" or "freeze") under certain circumstances.
This article has been archived and is no longer updated by Apple.

Symptom

Following the interruption of the connection:

- A spinning cursor may appear.
- New applications may not open.
- The Finder becomes unresponsive.

For example, this occurs when connected to a shared volume and the:

- IP address or Network Location of the computer is changed, or
- Computer is put sleep and then wakes when or where the server is unavailable, or
- The server is shut down, or the server's IP address is changed.

Note: Changing the Network Location may refer to two different actions. First, it may refer to using the Location menu to switch between locations in the Network preference pane. Second, it may refer to putting a portable computer to sleep while still connected to the server, carrying it to a different physical location, and then waking the computer where the server cannot be reached. An example of the latter would be connecting an iBook to a server at work, putting the iBook to sleep without first disconnecting it from the server, then waking the iBook at home.

Solution

To resolve the issue, you may have to force restart your computer using the power or interrupt button.

Avoid the issue in the future by ejecting any shared volumes before taking the actions described above.

If you accidentally trigger this issue, restoring connectivity to the server might eliminate the need for a forced restart.

Mac OS X: Setting Up AOL Is Different From Other Internet Service Providers

America Online dial-up service connects in a proprietary manner that is different from other Internet service providers, so you should not try to set it up as a normal PPP connection.

Note: This document applies to Mac OS X 10.2.8 or earlier.

This article has been archived and is no longer updated by Apple.
Most dial-up Internet service providers use the point to point (PPP) protocol. Dial-up connections to America Online use a different, proprietary protocol. For this reason, dial-up AOL customers should configure the AOL software to dial the modem directly (without using the normal Mac OS X preference panes, assistants, or utilities).

You should **not** type the AOL phone number, AOL user name, or AOL password information in any of these locations:

- Mac OS X Setup Assistant
- Network preference pane
- Internet Connect

If you use AOL over a wireless or broadband connection, then you should configure the above parts of Mac OS X as directed by your network administrator or Internet service provider.

Apple Remote Desktop: Managed Clients Become Unavailable

When managed clients are restricted to opening specific applications, Apple Remote Desktop clients become unavailable.
This article has been archived and is no longer updated by Apple.

Symptom

When managed Mac OS X clients are restricted to opening specific applications, Apple Remote Desktop clients become unavailable.

Solution

In certain scenarios when managing application access via Workgroup Manager, the process ARD Helper (/System/Library/CoreServices) may not be running. This can cause Remote Desktop clients to become unavailable. If this occurs, log out and then log back in to automatically relaunch the ARD Helper process.

Removing restrictions on applications in Workgroup Manager will resolve this.

If removing restrictions on applications is not preferred, allowing unbundled applications to launch is an alternative solution. For more information on allowing unbundled applications to launch, see technical document 107659, "**Workgroup Manager: How to Allow Use of Unbundled Applications**".

Mac OS: Classic or Mac OS 9 issues after installing HP ScanJet 3.0.1 update

After installing the Hewlett Packard ScanJet 3.0.1 Update, Mac OS 9 may have startup issues, or the Classic environment of Mac OS X may not start.

This article has been archived and is no longer updated by Apple.

After installing the HP ScanJet 3.0.1 Update:

- A computer with Mac OS 9 as the startup system folder has startup issues and may stop responding.
- The Classic environment of Mac OS X will not start.

Make sure CarbonLib 1.4 or later is installed in the Extensions folder of the affected Mac OS 9 System Folder.

For more information, see HP customer support document 15336 .

If the issue persists, reinstall the earlier HP ScanJet Manager 1.4 extension. Consult documentation that came with the software for installation instructions.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.2 or Later: Cannot Copy to FTP Servers in the Finder

You can use the Connect To Server command to connect to an FTP server in the Finder, but you will have read-only access. You cannot copy, or upload, to an FTP volume in the Finder.

This article has been archived and is no longer updated by Apple.

File Transfer Protocol (FTP) server volumes available in the Finder have read-only access, even when the FTP server is set to allow you write access.

If you want to copy files from a Mac OS X computer to an FTP server, you need to use an application other than the Finder.

You can use the Terminal utility or a third-party FTP utility such as:

- Interarchy, by Stairways Software (http://interarchy.com/)
- Fetch, by Fetch Softworks (http://fetchsoftworks.com/)
- Transmit, by Panic, Inc. (http://www.panic.com/transmit/)

Important: Mention of third-party websites and products is for informational purposes only and constitutes neither an endorsement nor a recommendation. Apple assumes no responsibility with regard to the selection, performance or use of information or products found at third-party websites. Apple provides this only as a convenience to our users. Apple has not tested the information found on these sites and makes no representations regarding its accuracy or reliability. Mac OS X: Format of DVD-R discs burned in the Finder

This article has been archived and is no longer updated by Apple.

Learn about the file format of DVD-R discs burned in the Finder.

With Mac OS X 10.2.8 or earlier, DVD-R discs burned in the Finder are Mac OS Extended format (HFS Plus). With Mac OS X 10.3 or later, they are a HFS Plus/ISO 9660 hybrid format, which can be read by most computer systems, including Microsoft Windows. The disc contains these filesystems: HFS+, ISO-9660 with Rock Ridge, and Joliet with Rock Ridge.

This does not apply to DVD-R discs burned in iDVD or DVD Studio Pro.

Mac OS X: Unexpectedly Starts Up to Login Window

This document explains what to do if the computer unexpectedly starts up to the Login Window instead of to the desktop. The Login Window displays either a list of user names, or name and password entry fields. It also has buttons named Restart and Shutdown.
This article has been archived and is no longer updated by Apple.

Symptom

The computer starts up to the Login Window instead of to the desktop of the Finder.

Solution

The Login Window appears at startup when the option to log in automatically has been deselected. Depending on which version of Mac OS X you are using, this option is found in either the Login or Accounts preference pane. This normally happens when you create a second user for the computer.

To log in, you will either select your user name from a list, or you will have to type your user name (depending on which is set in System Preferences). After selecting or typing your user name, enter your password, then click the Log In button.

If you have forgotten your password, see technical document 106156, "**Mac OS X: How to Change or Reset a User's Password**" .

To make your computer always log in as a specific user, see technical document 106164, "**Mac OS X: How to Log in Automatically at Startup**".
Published Date: Feb 17, 2012

Mac OS X: Speech Recognition - computer does not respond to spoken commands

This article has been archived and is no longer updated by Apple.

These are some tips you can use if the computer does not respond to spoken commands (Speech Recognition).

1. **Check your microphone**
Be sure that your microphone works, either with the Sound preference pane or an application capable of recording audio (such as iMovie).

2. **How are you speaking?**
Make sure you say commands in a calm voice that is not too soft or too loud. Watch the meter in the feedback window. If it shows only blue, you are too quiet. If it is red, you are too loud. When you say the command, do not shout or hesitate.

3. **Check your environment**
Avoid background noise. If you use Speech Recognition in a noisy environment, you may need to purchase a special microphone.

If background noise is unpredictable, try pressing the listening key 1/2 second before saying a command.

If you move your computer to a new environment, press the listening key 5 to 8 seconds before saying a command. You may need to adapt Speech Recognition to your environment again. If you use continuous listening while working in a noisy environment or having a conversation, Speech Recognition may become slow or less accurate. If this happens, turn off continuous listening.

4. **Check the listening name**
If you use continuous listening and the listening name is not configured as optional, make sure that the listening name is not blank. This setting may be found in the Speech preference's Listening tab. Alternatively, set Name Is: to "Optional before commands".

5. **Mac OS X 10.4 or later only: Check for (null) Address Book entries.**
Any contacts named "(null)" could lead to this issue. See this article for more information.

Some of this information may also be found in Mac Help, which is accessible from the Help menu on your computer. Speech Recognition does not work on all computers. See technical document 88229, "**Mac OS X: Speech Recognition Does Not Work on Some Computers**".

Mac OS X: Stickies Notes Off Screen After Changing Resolution

In some cases, after changing display resolution, notes in the Stickies application may be positioned so that the title bar is off screen.
This article has been archived and is no longer updated by Apple.

Symptom

You cannot drag a Stickies note after changing display resolution because its title bar is off screen.

Solution

1. Click the Stickies icon in the Dock.
2. Choose Window > "Arrange in Front".

Published Date: Feb 17, 2012

Mac OS X 10.2: Unable to Unlock (Authenticate) a System Preferences Pane

On rare occasions, System Preference panes appear locked and do not respond to attempts to unlock (authenticate).
This article has been archived and is no longer updated by Apple.

Symptom

System Preference panes such as Energy Saver or Date & Time appear with the locked icon and do not accepts changes, even from an Admin user. Clicking on the lock button does not open an authentication dialog as expected.

Solution

Quit and reopen the System Preferences application. Be sure that you are actually quitting the application, and not just closing the window.

Follow these steps:

1. Click the System Preferences icon in the dock.
2. Choose System Preferences > Quit System Preferences (or simply press Command-Q).
3. Reopen System Preferences by choosing Apple menu > System Preferences.

Mac OS X Server: Web Server Does Not Resolve Aliases

The web server in Mac OS X and Mac OS X Server will not resolve alias files created in the Finder.
This article has been archived and is no longer updated by Apple.

Symptom

When clients try to view a web page on your server with a URL that specifies a file, or contains a directory name, that corresponds to an alias file on your server, the page will not load.

Solution

Use a symlink instead of an alias. A symlink is similar to an alias and will be resolved to the original file or directory by both the Finder and the web server. You can create a symlink in the Terminal by using the command:

```
ln -s original_filename link_name
```

For more information, refer to the man page for the ln command by using the command:

```
man ln
```

Mac OS X: Mail - How to Remove Unused SMTP Servers

This document explains how to remove unused SMTP servers from Mail when using Mac OS X version 10.2.8 or earlier.
This article has been archived and is no longer updated by Apple.
Follow these steps:

1. From the **Go** menu, choose **Go to Folder**.
2. Type: `/Library/Scripts/Mail Scripts`
3. Click Go.
4. Locate the file "Manage SMTP Servers.scpt" that is in this folder, and open it. The Script Editor opens.
5. Click the Run button.
6. Once the script locates SMTP servers that are unused, a dialog box appears that says:

   "Choose one or more SMTP servers to delete. None of these servers are being used by your POP or IMAP accounts."

7. Select the server(s) to remove, and click OK.
8. Quit Script Editor.

Note: If no unused SMTP servers are found, a different message appears:

"All the SMTP servers you have defined are being used by active accounts."

AirPort Extreme Base Station: Some Third-Party Cards Cannot Connect

Some third-party 802.11b wireless cards do not connect to the base station when it is in Compatibility mode. The 802.11b Only mode allows you to work around the issue until you can update the affected card's drivers and/or firmware to join a the base station in Compatibility mode.
This article has been archived and is no longer updated by Apple.

Symptom

Some users cannot connect to the AirPort Extreme Base Station. The affected users have third-party wireless devices, and the base station is in Compatibility mode.

Note: "802.11b Compatible," or "Compatibility," mode is one that allows both 802.11b and 802.11g clients (such as AirPort and AirPort Extreme) to join the base station at the same time.

Solution

Any WiFi certified 802.11b wireless card should be able to connect to the AirPort Extreme Base Station when it is in Compatibility mode. Cards that are 802.11b compliant but not WiFi certified may or may not be able to connect when the base station is in Compatibility mode. But any 802.11b compliant wireless card should connect when the base station is in 802.11b Only mode. For best results, be sure that both AirPort and third-party software is up to date.

First, be sure that your AirPort software is version 3.1 or later. You may use the Software Update pane of System Preferences to update software on your Macintosh. After that, connect to the base station using AirPort Admin Utility. You will be prompted to update the base station. If you administer from a Microsoft Windows computer, you may download the latest base station firmware separately from Apple Software Downloads (http://www.apple.com/swupdates/), then use the AirPort Admin Utility for Windows to upload the firmware.

Second, be sure that you have the latest firmware and drivers for the affected third-party card. Updating them may resolve the issue for you. Check the website of your card's manufacturer to be sure that you have the most recent drivers and firmware installed.

If the issue persists, or if you cannot update immediately, you may follow these steps as a workaround:

1. Connect to the base station using AirPort Admin Utility.
2. Click the Show All Settings button.
3. Click the AirPort tab.
4. Set the Mode pop-up menu to 802.11b Only.
5. Update the base station.

You should now be able to associate the affected 802.11b card with the base station, which may allow you to download needed third-party software updates to that computer. If you update card software or firmware, you should set the base station back to 802.11b Compatible mode to see if your issue is resolved.

If you cannot connect to the base station in 802.11b Only mode, or if you already have the latest software/firmware and cannot connect to the base station in Compatibility mode, then you may contact the card manufacturer to ask if they have done testing with 802.11g access points.

AirPort Extreme Base Station: Dr. Bott Antenna Not Recognized, Does Not Work After Installation

After installing an Apple-certified external antenna for the AirPort Extreme Base Station, you will need to turn off the base station before the external antenna will work.

This article has been archived and is no longer updated by Apple.

Symptom

- Your Dr. Bott antenna is not recognized or working.
- Information in AirPort Admin Utility is not accurate.

Solution

Follow these steps:

1. Quit AirPort Admin Utility (if it is open).
2. Disconnect the base station power supply.
3. Disconnect then antenna from the base station, then reconnect it. This is to ensure that it is inserted completely.
4. Reconnect the base station power supply.
5. Open AirPort Admin Utility and connect to the base station.

Published Date: Feb 19, 2012

AirPort Extreme Base Station: Power Supply Compatibility

This document explains power supply compatibility for the AirPort Extreme Base Station.
This article has been archived and is no longer updated by Apple.
The AirPort Extreme Base Station may not be used with power supplies from the earlier AirPort Base Station (Dual Ethernet) or AirPort Base Station (Graphite).

The earlier AirPort Base Station (Dual Ethernet) or AirPort Base Station (Graphite) may not use the power supply from the AirPort Extreme Base Station.

AirPort Extreme, AirPort Express: Can‘t use USB printer utilities while printer sharing

You can use USB printer utilities when the printer is directly connected to a computer, not when the printer is connected to the USB port on the AirPort Extreme Base Station or AirPort Express.
This article has been archived and is no longer updated by Apple.
Tip: The Mac OS X Installer includes several third-party USB printer utilities. You can read about them here.

Base station printer sharing works with:

- AirPort Extreme Base Station
- AirPort Express
- Mac OS X 10.2.3 or later (AirPort Extreme)
- Mac OS X 10.2.7 or later (AirPort Express)
  Note: We encourage the Mac OS X 10.2.8 Update for all 10.2 users. The versions listed here are simply the minimum required.

When you need to use a USB printer utility, you should temporarily connect the printer to a USB port on a Mac OS X computer.

Published Date: Oct 7, 2016

AirPort Extreme Base Station: Some USB Printer Status Messages Not Available

When a printer is connected to the USB port on the AirPort Extreme Base Station, some types of printer status messages are not available.
This article has been archived and is no longer updated by Apple.

Symptom

When your printer is directly connected to a computer, it may offer status messages such as:

- out of paper
- out of ink
- printer busy

Status messages such as these may not appear when the printer is connected via USB to the AirPort Extreme Base Station.

Solution

Check for indicator lights on the printer itself that may convey the same meaning as the alert messages. If necessary for troubleshooting, temporarily connect the printer directly to your computer.
Published Date: Oct 7, 2016

Software you need to administer the AirPort Extreme Base Station

Wondering what software you need to administer your AirPort Extreme Base Stations? Look no further.
This article has been archived and is no longer updated by Apple.
The AirPort Extreme Base Station requires the versions of the Airport Admin Utility application that come with the AirPort 3.0 software package. This software is on the CD that comes with each AirPort Extreme Base Station.

AirPort 3.0 software can be used to administer all versions of AirPort and AirPort Extreme Base Stations, including AirPort Base Station (Graphite), AirPort Base Station (Dual Ethernet), and AirPort Extreme Base Station.

There are two installers for the AirPort 3.0 software on the CD. One installer is for use with Mac OS X 10.1.5 and the other for Mac OS X 10.2. The first installer contains Airport Admin Utility 2.0.7 and the second contains AirPort Admin Utility 3.0.1.

When working from Mac OS X 10.1.5 to administer an AirPort Extreme Base Station, you must have AirPort Admin Utility 2.0.7. When working from Mac OS X 10.2, you must have AirPort Admin Utility 3.0.1 or later.

Even though some versions of the AirPort Admin Utility are later than 2.0.7, they will not be able to administer the AirPort Extreme Base Station. For example, you can not use the AirPort Admin Utility 2.1 or 2.1.1 (available with some versions of the Mac OS X 10.2) to administer the AirPort Extreme Base Station.

Notes

1. AirPort client computers do not require 3.0 software and can use earlier versions to join the AirPort Extreme Base Station (including versions of Mac OS 9).
2. Some AirPort Extreme Base Station features are only available when using a client computer with an AirPort Extreme Card.
3. If you have AirPort Admin Utility version 2.0.6, see AirPort 3.0 Software: About the Two Versions of the AirPort Admin Utility.

AirPort 3.0 and later: Configuration applications don‘t accept high ASCII characters

This article has been archived and is no longer updated by Apple.

The AirPort Setup Assistant and other configuration applications do not accept high ASCII characters. If you try to enter a network or base station password that contains high ASCII characters, the AirPort Setup Assistant will not accept them.

High ASCII characters include the following:

Solution

Use any of the following characters to set passwords for your AirPort base stations:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
0 1 2 3 4 5 6 7 8 9
! " # $ % & ' ( ) * + , - . / : ; < = > ? @ [ \\ ] ^ _ ` { | } ~
```

For more information about ASCII and High ASCII, refer to http://en.wikipedia.org/wiki/ASCII.

AirPort 3.0 Software: About the Two Versions of the AirPort Admin Utility

This document explains the differences in the two versions of the AirPort Admin Utility that are part of the AirPort 3.0 software.
This article has been archived and is no longer updated by Apple.
AirPort 3.0 is the software group included on CD with the AirPort Extreme Base Station. This software group includes two versions of the AirPort Admin Utility, 2.0.7 and 3.0.1.

Note: A limited number of CDs include version 2.0.6 instead of 2.0.7. Any statement below that applies to version 2.0.7 also applies to 2.0.6. The two versions are functionally the same, and you do not need to update from 2.0.6 to 2.0.7.

About versions 2.0.7 and 3.0.1

AirPort Admin Utility 2.0.7 is for use with Mac OS X 10.1.5, and AirPort Admin Utility 3.0.1 is for use with Mac OS X 10.2 or later. AirPort Admin Utility 2.0.7 contains virtually the same feature set as AirPort Admin Utility 3.0.1, with exception of these differences:

In AirPort Admin Utility 3.0.1, there is a toolbar button to perform operations (upload software and/or saved configurations) to multiple computers. That button is not presented to Mac OS X 10.1.5 users in AirPort Admin Utility 2.0.7.

Figure 1 Configuring Multiple Base Stations

In AirPort Admin Utility 3.0.1, you can quickly add the admin-connected computer to the access control list by clicking the "This computer" button in the Access control panel. This button is unavailable in AirPort Admin Utility 2.0.7.

Mac OS X 10.2, 10.3, 10.4: Address Book - How to Locate and Use the "Map Of" Feature

In Mac OS X 10.2 and later, Address Book includes a "Map Of" feature for locating an address on a card.
This article has been archived and is no longer updated by Apple.
To use the "Map Of" feature, you must be connected to the Internet. Additionally, a given card must have at least one valid address and country entered. If necessary, click the Edit button to add one to the selected card before using the "Map Of" feature.

To see a map of a valid address, simply click the label (such as "Home" or "Work") that appears to the left of the address, as in Figure 1.

Figure 1 Accessing the "Map of" command

Note: The country field should be filled in in the vCard. Otherwise, the wrong map may appear. If the map shows the wrong country, you can either change the default country for all of your postal addresses in Address Book preferences, or you can edit the individual card to get a correct map:

1. Select a card that includes a postal address in a different country.
2. Choose Edit > Edit Card.
3. From the Home, Work, or Other pop-up menu, choose Change Address, then the desired country.
4. Repeat for other address fields if desired.

Mac OS X 10.2: Contents of Shared Folder Missing After Archive and Install

This document explains how you to recover items that were stored in the Shared folder (/Users/Shared) prior to an Archive and Install.
This article has been archived and is no longer updated by Apple.

Symptom

After an Archive and Install, the Shared folder is empty.

Note: This refers to the folder /Users/Shared, not to the "shared" folders of individual users, which are named Public and Sites.

Solution

1. Close any open Finder windows.
2. Click the Finder icon in the Dock.
3. Choose Go > Computer.
4. Locate this folder:

   /Previous Systems/Previous System n/Users/Shared

   Note: In the actual path, "n" will be a number, such as "1". If more than one Previous System is present, the one with the highest number is the one you most recently replaced via Archive and Install.

5. Choose File > New Finder Window.
6. In the new window, go to the folder: /Users/Shared .
7. Select all the items in the first finder window (Shared from the previous system).
8. Drag the selected items to Shared folder in the second Finder window (Shared from the current system).

Mac OS X 10.2 Managed Client: Cannot Start Classic

Managed Mac OS X clients cannot use Classic when applications are managed.
This article has been archived and is no longer updated by Apple.

Symptom

Managed Mac OS X clients cannot use Classic when access to Applications are managed. This is configured in Workgroup Manager.

When Classic is configured to start at login, it will appear in the Dock and then disappear. When Classic is started from System Preferences, an "error 1016" message appears.

Note: For affected computers that are not managed via Workgroup Manager, see technical document 107442, "**Mac OS X 10.2: 'Error 1016', Classic Fails to Start When Managing Applications**".

Solution

This issue is resolved by updating client computers to Mac OS X 10.2.5.
Published Date: Oct 7, 2016

Apple Remote Desktop 1.2: Read Me

Read the following before you install Apple Remote Desktop. It includes information about supported computers, system requirements, and known issues.
This article has been archived and is no longer updated by Apple.
This information is available in:

Français | Deutsch | Japanese

For more information about Apple Remote Desktop, visit this Apple Web site:

- http://www.apple.com/remotedesktop/

For information about support, training and certification programs, integration services, consulting, and enterprise support, see the Apple Professional Software Services and Support Guide included with Apple Remote Desktop.

Supported Computers

You can install this version of Apple Remote Desktop on any of the following computers.

Administration Computers

- eMac, iMac, iBook, Power Mac G3, Power Mac G4, or PowerBook G3, or PowerBook G4
- Mac OS X version 10.1 or later
- Ethernet (recommended), AirPort, or Airport Extreme network connection

Client Computers

- eMac, iMac, iBook, Power Mac G3, Power Mac G4, PowerBook G3, PowerBook G4, other PowerPC-based Macintosh, or Xserve
- Mac OS 8.1 through Mac OS 9.2, or Mac OS X version 10.1 or later
- Ethernet (recommended), AirPort, or Airport Extreme network connection

Additional Information

Compatibility with previous versions of ARD

The ARD version 1.2 admin will allow you to add ARD version 1.1 and version 1.0 clients to the computer list and will automatically assist you in upgrading ARD version 1.1 clients on Mac OS X.

Enabling Apple Remote Desktop On Mac OS X Client Computers

In the Remote Desktop System Preferences, select "Start Apple Remote Desktop client at System Startup". You must restart the client computer for the change to take effect.

Enabling Apple Remote Desktop On Mac OS 8 or 9 Client Computers

Please refer to the "Setting Up Apple Remote Desktop on Client Computers / Setting Access Privileges for Client Computers That Use Mac OS 8.1 Through 9.2" section of the Administrator's Guide (ARD Admin Guide.pdf).

Copy Performance

For optimal copy performance, the administrator and client computers should be on a wired network and in the same subnet.

Permissions

Before using Apple Remote Desktop to copy files from your administrator computer to a client computer that uses Mac OS X, set the permissions for the files you want to copy as you want them to be on the client.

NAT and Firewall Support

If you wish to use the Remote Desktop application from behind a NAT router, you will need to set UDP port forwarding for port 3283 to your

administration computer. If you wish to access a client computer that is behind a NAT router, you will need to set the router to forward UDP port 3283 to the client computer you wish to access. Note: You will be able to access only that client computer.

Other

When customizing the picture for the "lock" screen feature, you can now use any QuickTime still image format (.tiff, .jpg, .pict, etc.) as long as the main portion of the filename remains "Lock Screen Picture".

Known Issues

Administration Issues

To add computers from the network computers list, each one must have a unique computer name.

If an AirPort card or another network interface is enabled on your administration computer, the computer may be listed in the Setup Computers window. Do not add an administration computer to its own list. Management commands directed to the administrator's own computer will fail.

A Mac OS 9 system may be unresponsive during the execution of a Software Version Report.

Client Issues

In order to open a document on a Mac OS 9 Client, you should use the "Copy and Open" functionality instead of the "Open" functionality.

Computer Issues: Systems Using Mac OS X version 10.1.x

To enable the Request Attention menu on a client computer, each user must open RemoteDesktop.menu at least once. Then, a menu appears on the right side of the menu bar allowing the user to request attention. The RemoteDesktop.menu is located in /System/Library/CoreServices/Menu Extras/. You can use the "Go to Folder" command the Finder's Go menu to quickly locate the menu extra.

While controlling a remote computer some applications may enter a space when you use the delete key.

When you have made changes using the Remote Desktop preference pane, do not click the lock to prevent further changes. If you do, changes you made in the preference pane might not be saved.

AirPort Extreme: Controlling the Range of Your Network

You may adjust the transmission range of an AirPort Extreme Base Station.
This article has been archived and is no longer updated by Apple.
You can limit the range of your AirPort Extreme network to control who has access to it. By shortening the range of the network, only computers closest to the base station can join the network.

To shorten the range of the network:

1. Open AirPort Admin Utility (/Applications/Utilities/).
2. Select your base station, and click Configure.
3. Click the Show All Settings button.
4. In the AirPort pane, use the Transmit Power slider (Figure 1) to set the network range.

Figure 1 Adjusting the Transmit Power slider

These settings correspond to 10, 33, 50, 75 and 100 percent of transmission power.
Published Date: Feb 19, 2012

AirPort Extreme, AirPort Express: How to tell if a USB printer is connected to the base station

You may use the AirPort Admin Utility to confirm whether a USB printer is recognized by an AirPort Express or AirPort Extreme Base Station.

This article has been archived and is no longer updated by Apple.

Notes:

1. Some Mac OS X-compatible printers don't work as base station printers. If yours doesn't seem to be working, try this troubleshooting.
2. USB printing to an AirPort base station requires Mac OS X 10.2.7 or later.

Checking for a printer

Use these steps to verify that the base station recognizes your printer:

1. Open AirPort Admin Utility (/Applications/Utilities/).
2. Select your base station from the list, then click Configure.
3. Choose **View > Summary**.

The printer appears at the bottom of the Show Summary window if it is connected and recognized, like this:

If the printer is not listed here, try disconnecting the cables and reconnecting. Close the summary window, and repeat the steps above so that AirPort Admin Utility updates its listing.

Published Date: Feb 17, 2012

AirPort Extreme: Sharing a printer from the base station‘s USB port

Want to share a printer among your AirPort-enabled computers? No problem! Connect it to the USB port on the AirPort Extreme Base Station.

This article has been archived and is no longer updated by Apple.

Notes

1. Some Mac OS X-compatible printers don't work as base station printers. If yours doesn't seem to be working, try this troubleshooting.
2. USB printing with an AirPort Extreme Base Station requires Mac OS X 10.2.3 or later.
3. Mac OS X Bonjour (formerly "Rendezvous") technology is used to share the printer over your network. In the event that a compatible printer is not available to you using the steps below, remember to troubleshoot factors such as network configuration and firewalls that may affect Bonjour.

Follow these steps to print:

1. Open Print Center (Applications/Utilities/).
2. Click Add.
3. Choose Bonjour from the upper pop-up menu. If a compatible USB printer is recognized by the AirPort Extreme Base Station, it appears in the printer list.
4. Select the printer you want to use.
   Note: Be aware that the same printer may appear twice, under two different names. This may be the normal result of having connected the USB printer directly to your computer, then later connecting it directly to the base station, as shown below.

   If this happens and you do not know which is correct, choose Show Info from the Printers menu. As shown below, the Location field shows the printer is connected to a base station named "Boquillas". As in this example, check for the name of your base station here.

5. Click Add.

AirPort Extreme Base Station: Meaning of Indicator Lights (LEDs)

Use the chart in this document to determine the meaning of the indicator lights on the AirPort Extreme Base Station.
This article has been archived and is no longer updated by Apple.
The light emitting diodes (LEDs) on the AirPort Extreme Base Station provide status information through a series of blinking patterns. The AirPort Extreme Base Station uses white LEDs that do not change colors.

Published Date: Oct 7, 2016

AirPort Extreme: WAN Privacy Access Not Required to Print via USB

WAN privacy access is not required to use USB printing on the AirPort Extreme Base Station.
This article has been archived and is no longer updated by Apple.
Some AirPort Extreme documentation erroneously states that you must "Enable Remote Printer Access" in the WAN Privacy dialog of the AirPort Admin Utility.

That action is not required.

For more information on setting up USB printing using AirPort Extreme Base Stations, see technical document 107456, "**AirPort Extreme: How to Print via USB**".

AirPort 3.0 for Mac OS 10.1.5: Install Networking Update Before Installing AirPort Software

Prior to installing the AirPort 3.0 software group on a computer with Mac OS X 10.1.5, first install the Networking Update. AirPort 3.0 software is found on the CD included with AirPort Extreme, for example.
This article has been archived and is no longer updated by Apple.
Before installing AirPort 3.0 on to computers using Mac OS X 10.1.5, be sure that you have first installed the Networking Update.

To download the Networking Update, see software download document 120124, "**Networking Update 1.0 for Mac OS X : Information and Download**".

The Software Update preference pane will present you with updates you need, in the correct order. To learn more about this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".
Published Date: Oct 7, 2016

Apple Remote Desktop 1.2: How to Add or Remove the Menu Bar Item

You can remove the Apple Remote Desktop menu bar item, or re-add it later, by following the steps below.

Note: The menu bar item is represented by an exclamation point and contains the Request Attention command.
This article has been archived and is no longer updated by Apple.
To remove the Apple Remote Desktop menu bar item:

- While pressing the Command key, click and drag the Apple Remote Desktop icon below the menu bar, then release the mouse button.

To add the Apple Remote Desktop menu bar item:

- Double-click the file named: "RemoteDestkop.menu".

The file is located in this folder:

/System/Library/CoreServices/Menu Extras

Note: If you wish to remove the menu bar item permanently, you may delete this file.

Mac OS X 10.2: "Volumes" Window Opens After Using "Connect to Server" Command in Finder

After connecting to a server, the contents of your computer's Volumes folder may unexpectedly appear in the Finder.
This article has been archived and is no longer updated by Apple.

Symptom

A Volumes folder opens in the Finder after you connect to any remote volume.

Note: The folder displays the contents of the directory /Volumes/ on your computer, not that of the remote computer. The directory /Volumes/ is normally invisible in the Finder.

Solution

Update to Mac OS X 10.2.4 or later. See technical document 106704, "**Mac OS X: How to Update Your Software**".

Additional information

The Volumes folder appears whenever the URL for the server contains a trailing solidus (forward slash), such as in these two examples:

afp://server/
smb://server/share/

On affected versions of Mac OS X, you may avoid this issue by omitting the trailing solidus, such as:

afp://server
smb://server/share

In addition to URLs that you manually enter, computer names that appear automatically via Rendezvous, AppleTalk, or SLP may be affected when the discovery protocol publishes a URL that includes the trailing solidus.
Published Date: Feb 17, 2012

Workgroup Manager: Files Copied With Windows Service (SMB) Do Not Inherit Privileges as Expected

To avoid unexpected behavior that results from the failure of SMB permissions inheritance, do not select "Inherit permissions from Parent" from the Windows File Setting options.

This article has been archived and is no longer updated by Apple.

Symptom

In Workgroup Manager if you select the "Inherit permissions from Parent" options in Windows File Settings, the permissions are not inherited from the enclosing share point as implied. For example:

- A client may be able to open a file or folder that you believe you have restricted.
- A client may not be able to open a file or folder that you believe you have made available.

Solution

The "Inherit permissions from Parent" feature does not work. You should not select the "Inherit permissions from parent" option.

As a workaround, select the "Assign as follows" option instead. Using the Owner, Group, and Everyone pop-up menus, set the desired privileges for files to be copied to or from a share point by Windows clients.

Published Date: Feb 17, 2012

.Mac Address Book: Changes don‘t sync to your Mac OS X Address Book

This article has been archived and is no longer updated by Apple.

Issue or symptom

You may encounter one of these issues:

- Some changes made to your online .Mac Address Book may not successfully sync with your computer, or vice versa.
- You attempt to disable syncing in the online Address Book, but the syncing option remains enabled (yet syncing does not occur).
- Your online Address Book has not been synced in several days or weeks despite recent changes to it or to Address Book on your computer.

Solution

As a workaround:

1. Log out of .Mac by clicking Logout (don't just quit your Web browser).
2. Remain logged out of .Mac for at least 30 minutes.
3. Log back in to .Mac and try again.
4. If the issues still occur, contact .Mac Support.

Published Date: Feb 17, 2012

Mac OS X Server 10.2.4 or Later: How to Enable Integrated WebDAV Digest Authentication

With Mac OS X Server 10.2.4 or later, you may enable digest authentication for Web service. This document explains how.
This article has been archived and is no longer updated by Apple.

Enabling integrated WebDAV digest authentication

To use digest authentication for an existing WebDAV realm, you need to enable mod_digest_apple and change your virtual host configuration directives to use digest authentication instead of basic authentication.

Prior to version 10.2.4 of Mac OS X Server, you also needed to maintain a separate digest file containing a list of authorized users, passwords, and realms. This separate file is no longer necessary.

The new mod_digest_apple module first checks for users in a specified digest file. If the file is absent or unspecified, or if the user name and password fail to authenticate successfully against that file, the module tries to use Open Directory for user authentication. Open Directory users must be set up for password validation using Open Directory Password Server.

This approach applies to WebDAV authentication (called "author" access in Server Settings); it does not apply to access to Web pages via a browser (called "browse" access in Server Settings).

The Apple digest module is included in the standard installation of Mac OS X Server 10.2.4, but is disabled by default.

Follow these steps to enable mod_digest_apple:

1. As the root user, open this file in a text editor:

```
/etc/httpd/httpd.conf
```

Note: If you need help with this step, see technical document 106619, "**Mac OS X Server: How to Locate and Edit Configuration Files**".

2. Enable the digest module by adding the following lines to the file:

```
LoadModule apple_digest_module  /usr/libexec/httpd/mod_digest_apple.so

AddModule mod_digest_apple.c
```

3. Be sure the similar directives for the "standard Apache mod_digest" are deleted or commented out. (They are commented out by default):

```
#LoadModule digest_module /usr/libexec/httpd/mod_digest.so
...
#AddModule mod_digest.c
```

4. If you have enabled the newer Apache mod_auth_digest, you must disable that as well. Also, remove any Apache directives specific to that module from your Apache configuration files.

5. Save changes and close the file.

6. As the root user, open this file in a text editor:

```
/etc/httpd/httpd_macosxserver.conf
```

7. Find the WebDAV directives for the virtual host that contains the desired realm. Here is an example of the directives for "realm1":

```
<Directory "/Library/WebServer/Documents/realm1">
AuthName "realm1"
AuthType Basic
```

8. Change the AuthType from "Basic" to "Digest." Here are the completed changes for "realm1":

```
<Directory "/Library/WebServer/Documents/realm1">
AuthName "realm1"
AuthType Digest
```

9. Save changes and close the file.

The changes take effect when you restart Web service.

Any new virtual hosts you create using Server Settings are configured to use basic authentication by default. You will need to make the changes described above if you want to use digest authentication.

Starting with Mac OS X 10.2, the Finder issues a warning about clear-text passwords when a user tries to connect to a WebDAV server with basic rather than digest authentication. This warning should no longer appear when the server is configured for digest authentication.

Note: Some WebDAV clients do not use digest authentication. For example, Goliath 1.0 requires basic authentication.

Mac OS X 10.2: How to Set the MTU Value During Startup

Use the procedure below to create a startup item script that sets the maximum transmission unit (MTU) value for your network interface(s). This may be required when using certain Internet service providers.

Note: This document applies to Mac OS X 10.2 through 10.2.8.
This article has been archived and is no longer updated by Apple.
Important:

- This document discusses an advanced procedure. If you are not familiar with command line interface and manual configuration in general, you should seek assistance. If you do not follow these steps precisely, the script may not work, which could prevent the computer from starting up normally.
- AppleCare does not offer any type of free technical support on setting up or creating Startup Items. Contract based support for setting up and creating Startup Items, and creating shell scripts is only offered by Apple Professional Services. For more information on Apple Professions Services see (http://www.apple.com/services/).

Follow these steps to create a script that sets the MTU each time the computer restarts:

1. Open Terminal (/Applications/Utilities/).
2. Type: `cd /Library`
3. Press Return.
4. Type: `mkdir StartupItems`
5. Press Return. (If you encounter an error, continue to step 6.)
6. Type: `cd StartupItems`
7. Press Return.
8. Type: `mkdir MTU`
9. Press Return.
10. Type: `cd MTU`
11. Press Return.
12. Type: `pico MTU`
13. Press Return.
14. In the pico editor, paste in the following text.

Begin copying below this line.

```
#!/bin/sh

. /etc/rc.common

##
# Configure a network interface MTU setting
##
#
# This script will set the MTU setting for the specified interface(s)
#
# The name of the interface (ex. en0) must be edited to match the interface
# to which the MTU setting should be applied
#
##

StartService ()
{
ConsoleMessage "Configuring MTU"

### uncomment lines and change the value following 'mtu' as appropriate

if [ "${MTU:=-NO-}" = "-YES-" ]; then

# /sbin/ifconfig en0 mtu 1490
# /sbin/ifconfig en1 mtu 1490

fi

}

StopService ()
{
return 0
}
```

```
RestartService ()
{
return 0
}

RunService "$1"
```

End copying above this line.

15. Uncomment the /sbin/ifconfig line(s) to set the MTU for a particular interface.

Note: Removing the number sign (#) from the beginning of a line uncomments it. Typically, en0 is the interface name for the Built-in Ethernet port and en1 is interface name for the AirPort Card. This is not always the case, though. To confirm that a network port is associated with a particular interface name, open the Network Utility (/Applications/Utilities/), and click the Info tab.

16. When you have finished customizing the file, save it (press Control-O), press Return, and exit pico (press Control-X).

17. Type: chmod 755 MTU

18. Press Return.

19. Type: pico StartupParameters.plist

20. Press Return.

21. In the pico editor paste in the following text.

Begin copying below this line.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple Computer//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
 <key>Description</key>
 <string>Can set MTU</string>
 <key>OrderPreference</key>
 <string>None</string>
 <key>Provides</key>
 <array>
  <string>MTU</string>
 </array>
 <key>Requires</key>
 <array>
  <string>Network Configuration</string>
 </array>
</dict>
</plist>
```

End copying above this line.

22. When you have finished customizing the file, save it (Control-O), press Return, and exit pico (Control-X).
23. Type: `chmod 755 StartupParameters.plist`
24. Press Return.
25. Type: `sudo pico /etc/hostconfig`
26. When prompted, enter your password.
27. Press Return.
28. In the pico editor, add this line at the bottom:

```
MTU=-YES-
```

29. Save it (Control-O), press Return, and exit pico (Control-X).

When you restart the computer, MTU is set for the interface that you specified.

Notes

1. The MTU will be reset after changing a Location, waking the computer from sleep, or changing the state of the network interface. To use the script again without having to restart, enter the following command:

```
sudo SystemStarter start MTU
```

2. If you experience any issues or wish to not set MTU during startup, you can turn off the new script by changing the MTU line in /etc/hostconfig to:

```
MTU=-NO-
```

Published Date: Oct 7, 2016

Mac OS X 10.2: How to Set Ethernet Speed and Duplex During Startup

Use the procedure below to create a startup item script that sets the Ethernet speed and duplex settings for your network interface(s).

Note: This document applies to Mac OS X 10.2 through 10.2.8.
This article has been archived and is no longer updated by Apple.
Important:

- This document discusses an advanced procedure, intended primarily for institutional networks on which certain third-party hardware precludes automatic negotiation of a full duplex connection. If you are not familiar with command line interface and manual configuration in general, you should seek assistance. If you do not follow these steps precisely, the script may not work, which could prevent the computer from starting up normally.
- AppleCare does not offer any type of free technical support on setting up or creating Startup Items. Contract based support for setting up and creating Startup Items, and creating shell scripts is only offered by Apple Professional Services. For more information on Apple Professions Services see (http://www.apple.com/services/).

Note: You may not be able to configure the available options on some Ethernet network interfaces and network connections. Use the ifconfig command to test a particular option before using it in the script. You cannot set the speed and duplex settings for AirPort Cards.

Follow these steps to create a script that is executed during startup, setting the speed and duplex settings:

1. Open Terminal (/Applications/Utilities).
2. Type: `cd /Library`
3. Press Return.
4. Type: `mkdir StartupItems`
5. Press Return. (If you encounter an error, continue to step 6.)
6. Type: `cd StartupItems`
7. Press Return.
8. Type: `mkdir SpeedDuplex`
9. Press Return.
10. Type: `cd SpeedDuplex`
11. Press Return.
12. Type: `pico SpeedDuplex`
13. Press Return.
14. In the pico editor, paste in the following text.

Begin copying below this line.

```
#!/bin/sh

##
# Configure network interface speed and duplex settings
#
# Note: speed and duplex settings are not supported on AirPort cards
#
##

. /etc/rc.common

StartService ()
{
ConsoleMessage "Configuring Speed and Duplex"

##
# Speed and Duplex
##

if [ "${SPEEDDUPLEX:=-NO-}" = "-YES-" ]; then

# /sbin/ifconfig en0 media 10baseT/UTP mediaopt full-duplex
# /sbin/ifconfig en0 media 100baseTX mediaopt full-duplex
# /sbin/ifconfig en0 media 1000baseTX mediaopt full-duplex
#
# /sbin/ifconfig en0 media 10baseT/UTP mediaopt half-duplex
# /sbin/ifconfig en0 media 100baseTX mediaopt half-duplex
# /sbin/ifconfig en0 media 1000baseTX mediaopt half-duplex
```

```
fi

}

StopService ()
{
return 0
}

RestartService ()
{
return 0
}

RunService "$1"
```

End copying above this line.

15. If you want to set the speed and duplex of an interface, uncomment one of the six speed lines (such as "/sbin/ifconfig en0 media 100baseTX mediaopt full-duplex") that you want for that interface. If you leave all six lines commented, then the interface remains in auto-select mode.

Note: Removing the number sign (#) from the beginning of a line uncomments it. Typically, en0 is the interface name for the Built-in Ethernet port, and en1 is interface name for the AirPort Card. This is not always the case. To confirm that a network port is associated with a particular interface name, note its Ethernet Address on the TCP/IP tab of the Network preference pane and compare that to the output of the ifconfig command when entered in the Terminal.

16. When you have finished customizing the file, save it (press Control-O), press Return, and exit pico (press Control-X).
17. Type: `chmod 755 SpeedDuplex`
18. Press Return.
19. Type: `pico StartupParameters.plist`
20. Press Return.
21. In the pico editor paste in the following text.

Begin copying below this line.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple Computer//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
 <key>Description</key>
 <string>Can set Speed and Duplex</string>
 <key>OrderPreference</key>
 <string>None</string>
 <key>Provides</key>
 <array>
  <string>SpeedDuplex</string>
 </array>
 <key>Requires</key>
 <array>
  <string>Network Configuration</string>
 </array>
</dict>
</plist>
```

End copying above this line.

22. When you have finished customizing the file, save it (Control-O), press Return, and exit pico (Control-X).
23. Type: `chmod 755 StartupParameters.plist`
24. Press Return.
25. Type: `sudo pico /etc/hostconfig`
26. When prompted, enter your account password.
27. Press Return.
28. In the pico editor, add this line at the bottom:

SPEEDDUPLEX=-YES-

29. Save it (Control-O), press Return, and exit pico (Control-X).

When you restart the computer, speed and duplex settings are set for the interface that you specified.

Notes

1. The speed and duplex setting will be reset after changing a Location, waking the computer from sleep, or changing the state of the network interface. To use the script again without having to restart, enter the following command:

```
sudo SystemStarter start SpeedDuplex
```

2. If you experience any issues or do not want to set speed and duplex during startup, you can turn off the script by changing the SPEEDDUPLEX line in /etc/hostconfig to:

SPEEDDUPLEX =-NO-

Published Date: Oct 7, 2016

iChat: Cannot Send or Receive a File When Firewall Is Active

When the Mac OS X firewall is active, you cannot send or receive a file via iChat.

This article has been archived and is no longer updated by Apple.

Symptom

iChat cannot send or receive a file when the Mac OS X firewall is active in its default state. If you have opened the AIM port, you may be able to receive a file but not send them.

Solution

In its default state, the Mac OS X firewall blocks file transfers using iChat or America Online AIM software. If either the sender or receiver has turned on the Mac OS X firewall, the transfer may be blocked.

The simplest workaround is to temporarily turn off the firewall in the Sharing preference pane on both computers. This is required for the sender. However, the receiver may keep the firewall on if the AIM port is open. To open the AIM port:

1. Choose Apple menu > System Preferences.
2. Choose View > Sharing.
3. Click the Firewall tab.
4. Click New.
5. Choose AOL IM from the Port Name pop-up menu. The number 5190 should already be filled in for you.
6. Click OK.

If you do not want to turn off firewall at the sending computer, a different file sharing service may be used instead of iChat. The types of file sharing available in Mac OS X are outlined in technical document 106461, "**Mac OS X: File Sharing**".

Note: If you use a file sharing service when the firewall is turned on, be sure to click the Firewall tab and select the service you have chosen in the "Allow" list. If you do not do this, the firewall will also block the file sharing service.

This document will be updated as more information becomes available.

Apple Remote Desktop 1.2: Set Network Startup Command Does Not Display All Available Images

The first time it is used, the Set Network Startup command may not display all available NetBoot and/or Network Installation images on a subnet.
This article has been archived and is no longer updated by Apple.

Symptom

Some NetBoot and/or Network Installation images do not appear the first time you choose Manage > Set Network Startup.

Solution

If the NetBoot or Network Installation image does not appear, follow these steps:

1. Close the Set Network Startup window.
2. Go to another computer on the same subnet.
3. Using the Startup Disk preference pane at that computer, verify the image is available
4. At the ARD administration computer, select the Set Network Startup command again.

The desired NetBoot or Network Installation image should be available if it is properly enabled on your server.

For more information on NetBoot and Network Installation image behavior see these documents:

- Mac OS X Server Admin Guide
- Technical document 106965, "**Mac OS X Server 10.2: NetBoot and Network Installation Image Behavior**"

Published Date: Oct 7, 2016

AppleWorks 6: Difficulty Importing Microsoft Word Files in Mac OS 9 or Earlier

This document explains what to do if you cannot import Word files into AppleWorks 6.0 or later in Mac OS 9 or earlier.
This article has been archived and is no longer updated by Apple.

Symptom

1. When opening a Word file by double-clicking or choosing File > Open in the Finder, one of these symptoms may occur:
   - The file does not open in AppleWorks 6.
   - The file is imported as the wrong document type, such as spreadsheet or plain text.
   - You see the message "Could not find the application program 'Microsoft Word' to open the document...".
2. When dragging a Word file onto the AppleWorks 6 application icon, the document may be imported as the wrong document type, such as spreadsheet or plain text.
3. If you choose the Open dialog within AppleWorks and try to select the Word file, the file is dimmed.

Solution

Check translation software

Make sure the file translation components are properly installed. See technical document 88150 "**AppleWorks 6: Cannot Locate the Microsoft Word and Excel Translators After AppleWorks 6.1.2 Update**".

Compatible format?

Confirm the file is in a compatible format. AppleWorks 6 does not import Microsoft Word 5 or earlier formatted files.

Try updating software

Update to AppleWorks 6.2.3 or later. Updates are available from the AppleWorks website (http://www.apple.com/appleworks/).

File Exchange settings

If you are using Mac OS 9.2.2 or earlier, edit the Microsoft Word entries from the File Exchange or PC Exchange control panel. Follow these steps:

1. Open the File Exchange (Mac OS 9) or PC Exchange (Mac OS 8) control panel.
2. Sort the PC Exchange listing by PC Extension/Suffix.
3. Delete all .doc entries from the PC Exchange listing.
4. Click Add. The control panel searches for applications on the hard disk, and the Add Mapping window appears.
5. In the Extension field, type: doc
6. In the Application listing, select SimpleText.
7. In the File Type menu, select TEXT.
8. Click Add.
9. Close the File Exchange control panel.
10. Copy a fresh copy of the file to the Mac OS computer.
11. Open the file as described below.

Use Open command

Do not double-click the file or drag and drop the file onto the AppleWorks application to open it. Instead, open the file from within AppleWorks 6 by following these steps:

1. Choose File > Open.
2. Choose Word Processing from the Document Type pop-up menu.
3. Choose the appropriate Word format from the File Format pop-up menu.

Mac OS X 10.2: Folders Created on Windows AFP Share Have Wrong Permissions

Folders created on a Windows 2000 Server by Mac OS X AFP clients may have the wrong permissions, preventing Mac OS X users from accessing the folders they create.

This article has been archived and is no longer updated by Apple.

Symptom

A Mac OS X user has no access to the folder she created on the server's AFP share point.

Solution

This issue is resolved in Mac OS X 10.2.5 and later. For affected versions, you may use the following solution.

At the Windows 2000 Server, follow these steps:

1. Choose Start > Programs > Administration Tools > Computer Management.
2. Choose Shares from the Tree section of the Computer Management window.
3. Double-click the Macintosh share to view the properties for the share.
4. Click the Security tab in the Properties window for the share.
5. Click the Advanced button to view the Access Control Settings for the share.
6. Click the Owner tab in the Access Control Settings window for the share (Figure 1).
7. Set the owner of the share to be the Administrators group, not the Administrator user.

Mac OS X Server 10.2 or later: How to Set Custom Client View Options for Server Volumes

You can set custom view options (window size, icon placement, and so forth) that clients see when they connect to a server volume via Apple File Service (AFP).
This article has been archived and is no longer updated by Apple.
You can customize the size, position, and other view options of the window that clients see when they connect to a server volume via Apple File Service (AFP). You can do this on a per-volume basis.

To customize view options, follow these steps:

1. Log in to a client computer.
2. Using Connect to Server, connect to the target volume as the owner of the volume; the owner must **not** be an administrator account (see Notes 1, 2, and 3, below).
3. Make any desired changes to the window position, view mode (Icons, List, Columns), icon arrangement, or any of the settings found in View Options window (Command-J).
4. Disconnect from the server volume by dragging it to the Trash.

When you disconnect from the server volume, your changes are saved. Subsequently, all users will see that view of the server volume when they connect to it. Users may still make temporary changes that will persist on their computers for as long as they are connected to the volume. This will not affect the view options set by the owner, even if the other users have write access to the volume. These changes only affect remote users. If you view the volume locally at the server, these changes may not be seen.

Notes

1. For purpose of this document, "administrator account" refers to a user who can "administer the server", as indicated in the Accounts pane of Workgroup Manager.

2. Complying with these steps may mean changing the owner of the volume. You should not try to comply by deselecting "administer the server" when only one administrator account exists, since that may create a situation in which you have to fall back on the root account to reestablish your administrator status.

3. The requirement that you not log in with an administrator account assumes that the shared volume is a directory (folder) on one of the server's logical volumes (such as a disk). If the entire logical volume is being shared, then you may log in with an administrator account.

Background information

You cannot set persistent view options when logged in with an administrator account, because the window information for most folders is stored in a hidden file of that folder's enclosing folder (parent directory). So for folder B on volume A, the window information is stored in the root directory of volume A, not within folder B. When you log in via AFP to the server as an administrator, you will get all of volume A. Thus when you make changes to the window information for folder B, the changes are stored outside folder B. When other users log in, they do not see this information (since it is outside the share point), and they revert to a default view.

The exception to this rule is when the folder is a volume root. In this case, there is no parent directory, so all window information for the window of volume A itself is within volume A. When you mount folder B remotely as a non-administrator owner, it is seen as a volume root, so its behavior changes and it stores its own window information within itself.

Because the share point is a folder on the server that is seen as a volume by remote users, the window information is stored differently depending on whether you view it locally or remotely. Thus, the window may appear one way to remote users and another when you view it locally at the server.

Mac OS X 10.2: MS-DOS Disk Does Not Appear in Finder

A local MS-DOS (FAT32) volume, whether a whole disk or a partition, will not appear in the Finder ("mount") if it is larger than 128 GB.
This article has been archived and is no longer updated by Apple.

Symptom

- The MS-DOS volume does not appear on the desktop or in a Finder window.
- In the log file /var/log/system.log, there is a line containing "mountmsdosfs(): disk too big, sorry".

Note: "Local" volumes are those that are directly connected to your computer, including hard drives that connect via ATA, SCSI, USB, and FireWire. This issue does not affect remote volumes, such as "shares" on a Microsoft Windows server.

Solution

If your computer has a hard drive that is larger than 128 GB and that must be used locally in MS-DOS format, partition it so that no individual partition is larger than 128 GB. You could also share the disk from another computer and connect to it from your Macintosh.

The remainder of this document provides more information on partitioning and sharing.

How to partition

Connect the drive to a computer that is using a Microsoft Windows or Linux operating system. Use an appropriate disk formatting utility to partition it so that each volume is smaller than 128 GB.

Warning: With most disk utilities, partitioning a disk requires erasing the whole disk. Be sure to back up any files you wish to keep before partitioning.

Notes

1. The Disk Utility application included with Mac OS X allows you to format an entire hard disk as MS-DOS, but it will not allow you to choose MS-DOS when partitioning. Therefore, Disk Utility may not be used as a solution in this scenario.

2. Disk Utility allows you to initialize a hard disk larger than 128 GB as MS-DOS, but it will not appear in the Finder after being initialized.

3. If you are transferring a hard drive that was installed in another computer to a Macintosh and plan to use it only in the Macintosh, you may use Disk Utility to reformat it as something other than MS-DOS (Mac OS Extended, for example). Though the disk will not appear in the Finder prior to initialization, it will still be available to Disk Utility.

How to share the disk

Connect the hard drive to a computer using a Windows or Linux operating system. On that computer, share the disk using either SMB (Windows or Samba service) or FTP. Refer to Windows or Linux documentation for information on how to set up sharing.

Note: Though some non-Apple systems offer an Apple sharing service (AFP), you should not use it in this case.

To connect to the disk from a Mac OS X computer:

- If you share using SMB, connect your Mac OS X computer using the Connect to Server command in the Finder, as explained in technical document 106471, "**Mac OS X 10.1 or Later: How to Connect to Windows File Sharing (SMB)**".
- If you share the disk via FTP, you may connect with a Web browser (by starting the address with "ftp://" instead of "http://"), or by using a dedicated FTP application program.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X Server: About Privilege Mapping and When It Is Used

Apple File Service uses privilege mapping as a method of translating a remote client's "effective" server privileges for use in the client's local environment. Circumstances determine whether this or other methods are used, as explained in this document.
This article has been archived and is no longer updated by Apple.
Note: This document assumes that you know how to read Terminal output for user, group, owner, directory, and privileges information. If you cannot, you should seek assistance. How to read this information is explained in part in technical document 106712, "**Mac OS X: Troubleshooting Permissions Issues**".

When privilege mapping is used

Privilege mapping is used if:

- The client and server do not share a common directory service, or
- The account used to log in at a the client is not the same one used to log in to the server.

For example, you use the account "locadmin" to log in to a Mac OS X computer, then connect to a Mac OS X Server with an account named "01user," mounting a share point named "Groups". Viewed at the server, the privileges for Groups look like this:

```
ls -ld /Groups
drwxrwxr-x   7 root  admin   264 Jan  8 03:15 Groups

ls -l /Groups
drwxr-x---  6 15user  group1    264 Jan  7 13:00 group1
drwxr-xr-x  5 15user  group2    264 Nov 26 03:15 group2
drwxr-xr-x  5 01user  managed   264 Nov 21 03:15 managed
drwxr-x---  5 04user  mmanaged  264 Nov 21 03:15 mmanaged
drwxr-xr-x  5 11user  tgroup1   264 Jan  8 03:15 tgroup1
```

When viewed at the client, privileges for Groups looks like this:

```
ls -ld /Volumes/Groups
dr-xr-xr-x   7 locadmin  unknown   264 Jan  8 03:15 Groups

ls -l /Volumes/Groups/
d---------  6 locadmin  unknown  264 Jan  7 13:00 group1
dr-xr-xr-x  5 locadmin  unknown  264 Nov 26 03:15 group2
drwxr-xr-x  5 locadmin  unknown  264 Nov 21 03:15 managed
dr-x------  5 locadmin  unknown  264 Nov 21 03:15 mmanaged
dr-xr-xr-x  5 locadmin  unknown  264 Jan  8 03:15 tgroup1
```

The effective privileges seen here are the union of owner, group, and everyone, as applies to 01user. You can see that these "mapping" actions have taken place to present 01user's privileges as those of localadmin:

- The effective owner privilege is taken from the actual server privilege of the authenticated account.
- Thus, 01user's actual server privilege has been transposed into the owner's slot of the effective privilege output; and all folders are presented as if localadmin is the owner, even though he is not in reality. This presentation of the owner privilege is known as User Access Rights (UARights), as described in "Inside AppleTalk", pages 13-32. The user access rights (UARights) contain a summary of what the rights are, regardless of the category (owner, group, world) from which they were obtained.
- Server groups are represented locally as "unknown", and the group permissions are just a copy of world (everyone) permissions.
- Effective group privileges echo the server's actual everyone privileges.

Examples:

- Actual privileges of the folder mmanaged are 750, and 01user is a member of the group mmanaged. From the mapped perspective, this becomes a privilege of 500 for localadmin.
- Actual privileges of the folder group1 are 750, and 01user is not a member of group1. Thus, the folder group1 is locally locked with effective mapped privileges of 000 for localadmin.
- Actual privileges of the folder "managed" are 755. Because 01user owns this folder, the effective mapped privileges are also 755.

When privilege mapping is not used

Privilege mapping is not used when:

- The client and server share a common directory service such as Open Directory, LDAP or NetInfo, and
- The same account is used to log in to both the client and the server.

Using the same Groups directory as above and 01user this scenario, these are the privileges seen at the client:

```
ls -ld /Volumes/Groups
drwxrwxr-x   7 root  admin   264 Jan  8 03:15 Groups

ls -l /Volumes/Groups
drwxr-x---  6 15user  group1    264 Jan  7 13:00 group1
drwxr-xr-x  5 15user  group2    264 Nov 26 03:15 group2
drwxr-xr-x  5 01user  managed   264 Nov 21 03:15 managed
drwxr-x---  5 04user  mmanaged  264 Nov 21 03:15 mmanaged
drwxr-xr-x  5 11user  tgroup1   264 Jan  8 03:15 tgroup1
```

Privilege mapping is not being used, since the client and server are sharing a common directory service, allowing the client to readily resolve the user and group names and ID numbers used on the server.

Notes

1. Unmapped permissions provide better compatibility for applications that rely upon specific behavior with respect to permissions. For example, the chmod command might be expected to work since 01user appears to be the owner, but will be rejected by the server when the actual owner is not 01user. Additionally, sticky bits cannot be set or used. These differences may cause issues in subtle ways.

2. Unmapped permissions are necessary when using the "Inherit permissions from parent" setting on AFP share points.

3. Unmapped permissions should be used with AFP home directories.

Situations to avoid

Unpredictable results can occur when an account exists on both client and server with the same short name and/or UID, and the client and server do not share a directory service.

Note: GIDs and UIDS do not conflict with each other. The server being used in all of these examples has both a user (01user) and a group (mmanaged) with the ID 1026. Privilege mapping is off in this example, but the client cannot resolve the UIDs and GIDs used by the server. At a client computer that has a local "01user" account with a UID of 1026, and the same server as before, the privileges look like this:

```
ls -ld /Volumes/Groups
drwxrwxr-x   7 root  admin  264 Jan  8 03:15 Groups

ls -l /Volumes/Groups
drwxr-x---  6 1040    1027  264 Jan  7 13:00 group1
drwxr-xr-x  5 1040    1028  264 Nov 26 03:15 group2
drwxr-xr-x  6 01user  1025  264 Feb  3 16:21 managed
drwxr-x---  5 1029    1026  264 Nov 21 03:15 mmanaged
drwxr-xr-x  5 1036    1029  264 Jan  8 03:15 tgroup1
```

Note that ID numbers appear instead of user and group names. This is because the client has no way of determining which users and groups these IDs correspond to. Also note that "01user" will be denied access to the "mmanaged" folder, even though the user is a member of the mmanaged group on the server. The client cannot map GID 1026 to any group, so the user cannot be a member of that group.

Important: This same situation can occur with a common directory service if groups are created in the local domain on the server. Workgroup Manager warns that you are working in a domain that it not network visible.

Mac OS X: Cannot Connect to Windows (SMB) Server Using Password Stored in Keychain

This document explains how to connect to a Windows (SMB) server with a user name and password stored in the keychain.
This article has been archived and is no longer updated by Apple.

Symptom

After storing your user name and password for an SMB server in a keychain, the stored information does not work as you would expect when you connect to the server again. You must re-enter your user name and password.

Solution

Create an alias of the SMB share point. Follow these steps:

1. Click the Finder icon in the Dock.
2. Choose Go > Connect to Server.
3. Enter the SMB server address, and click Connect.
4. Select the desired share point.
5. Choose Go > Computer.
6. Drag the SMB volume from the Finder window to your desktop. The icon that appears on the desktop after you drag it will be an alias.
7. From the Finder window, select the SMB volume and choose File > Eject.
8. Double-click the alias created in step 6.
9. Enter your user name and password, then select Add to Keychain.
10. Click OK.

The next time you connect to this SMB volume using the alias, the keychain will work as expected.

Additional information

If you click the Computer button in a Finder window then select a volume, the Make Alias command is dimmed. This is normal behavior, because accounts other than root do not have permission to create new items in the Computer list. Dragging the volume to a place where you have permission allows you to make the alias, as you did in the steps above.
Published Date: Feb 17, 2012

Mac OS X 10.2: Internet Sharing Does Not Work When MTU Value Is Exceeded

Internet Sharing will not work with certain Internet service providers, because the maximum transmission unit (MTU) value of the ISP is set lower than that of Mac OS X. This document explains how to resolve the issue.
This article has been archived and is no longer updated by Apple.

Symptom

The computer that is sharing its connection may connect to the Internet, but client computers (those that are using the shared connection) experience these issues:

- Web pages load only partially, or not at all; forms within Web pages (including online discussion forums and registration forms) may not work as expected.
- Sherlock cannot search the Internet.
- Email may not be sent.
- Automatic Software Update does not work.
- iTunes cannot connect to Internet radio.

Other Internet-related issues may be caused by an MTU issue.

Various Internet service providers could be affected, and some customers of these are known to be affected:

- Covad ADSL (United States)
- Eircom (Ireland)
- NTT FLET'S ADSL service (Japan)
- NTT B FLET'S service (Japan)
- PacBell DSL (United States)
- Wanadoo (France, Jordan, Lebanon, Luxembourg, Morocco, Spain, the Netherlands, the United Kingdom, and Salvador)

Solution

Update to Mac OS X 10.2.5 or later.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Macintosh Manager 2.2.2: Clients cannot locate or log in to the server

Learn what to do if Macintosh Manager 2.2.2 clients are unable to locate or log in to the Macintosh Management Server.
This article has been archived and is no longer updated by Apple.
When the clients can't log in, this is sometimes referred to as having a "deaf" server. This could happen when using:

- Mac OS X Server 10.2.8
- Macintosh Manager 2.2.2

AppleTalk versus TCP/IP

This may happen when clients connecting to the server via AppleTalk. TCP/IP is preferred.

When clients choose a server name from the list provided at the Login Window, AppleTalk is used to connect. When clients select a server by choosing "Other Remote Server", followed by an IP Address or host name, then TCP/IP is used to connect.

Disabling Authentication Manager on upgraded servers

If the server was upgraded from 10.1 to 10.2, you should disable the Authentication Manager (also known as "tim"). To do that, locate this line in the /etc/hostconfig file:

```
AUTHSERVER=-YES-
```

Change the line to say:

```
AUTHSERVER=-NO-
```

Save the change, and restart the server.

Note: Disabling the Authentication Manager ("tim") will prevent any Basic Password users from accessing the server via SMB (Windows file sharing). These users should be updated to use the Password Server.

Mac OS X Server 10.2: Imaging DVD Discs for NetBoot and Network Install

This document discusses creating NetBoot and Network Install images from DVD discs.
This article has been archived and is no longer updated by Apple.
NetBoot and Network Install images can be created with DVD source discs when using Mac OS X 10.2.4 or later. If you are creating an image on a client computer, be sure to copy the updated version of Network Image Utility from the server to the client computer.

When imaging DVD discs, Network Image Utility asks if you want to continue the imaging process with a second disk. Click Cancel when prompted for the second disk.

Important: If you click Continue when asked about the second disk, you must force quit Network Image Utility by pressing Command-Option-Escape. After a force quit, the imaging process is not complete. You should start over with a new image.

Mac OS X Server: About the Mac OS X Server 10.2.5 Update

This software updates Mac OS X Server 10.2.4 to 10.2.5.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin user and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install. Installation

Installation

There are two ways to update to Mac OS X Server 10.2.5.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Software Downloads (http://www.apple.com/swupdates/).

Two versions of the installer are available. One is for updating version 10.2.4 to 10.2.5; the other for updating 10.2, 10.2.1, 10.2.2, 10.2.3, or 10.2.4 to 10.2.5 (a "Combo" update). This document describes the former. If you need to use the Combo update, see technical document 107492, "**Mac OS X Server: About the Mac OS X Server 10.2.5 Update (Combo)**".

Enhancements delivered with this update

This update delivers enhancements, as outlined below.

Open Directory and Password Server

- Adds a Network Information System (NIS) plug-in for Open Directory, allowing Mac OS X Server and clients to better integrate into this traditional Unix directory structure.
- Import tool (dsimportexport) performance improved when importing users with Password Server passwords.
  Note: Workgroup Manager is currently the only supported tool for exporting user and group information.
- LDAP connections now time out, operating more efficiently in high-volume networking environments. The default timeout value is two minutes. (Applies the LDAPv3 plug-in only.)
- New user accounts that have Password Server passwords and which are created by secondary administrators respect the "Disable login as of mm/dd/yyyy" option.
- Improved Password Server reliability and performance with DIGEST-MD5 authentication, especially after long server uptime.
- Improved performance for Password Server authentications.

File Services

- Improved handling of server volume aliases that have been copied from one user's environment to another.
- Improved Apple Filing Protocol (AFP) client permissions handling related to exclusive access of files. Resolves some instances of messages such as:
  - "<file name> cannot be accessed"
  - "The file may be read-only"

  - "you may be trying to access a read-only location"
  - "the server the document is stored on may not be responding"
  - Example: Microsoft Excel can now open text documents on AFP volumes which were previously affected.
- Prevents two applications on two computers from opening the same file at the same time from an AFP volume with write access. (Carbon supports denyWrite and denyRead/DenyWrite on AFP volumes as documented in "Inside Macintosh", pages 2-17.)
- Improves Classic compatibility by not caching read-write data from the Classic environment to an AFP volume, providing behavior more consistent with Mac OS 9 access to AFP volumes.
- AFP client software works as expected when connecting to Windows 2000 server share points. It is no longer necessary to configure your Windows 2000 share points to be owned by an administrator group.

Client Management and Workgroup Manager

- Updates Workgroup Manager to version 1.2.1.
- Managed Mac OS X clients can use Classic when access to Applications are managed (configured in Workgroup Manager). For reference, see technical document 107450, "**Workgroup Manager: Managed Clients Cannot Start Classic**".
- Group identification numbers (GID) of users imported into Workgroup Manager are properly retained.
- Resolves a managed client access issue that resulted in the alert message "Couldn't contact Spell Checker" for certain applications.
- Resolves an issue in which Workgroup Manager stopped responding while applying presets after importing users, resulting in "error 14901".
- Improved performance for display of user records in Workgroup Manager.

Server Administration Applications

- Server Monitor now reports RAID status as "degraded" only when applicable on servers with journaled mirrored volumes. See technical document, 107406 "**Mac OS X Server 10.2: Server Monitor Indicates Journaled RAID Volume Is 'Degraded'**".
- Server Monitor correctly reports CPU temperature of a monitored Xserve.

NetBoot, Network Install, and Network Image Utility

- Network Image Utility may now create installable images of server software.
- Building a NetBoot or Network Install image using the Network Image Utility or other tool requires specific privileges to be set on the source CD. The source CD must have privileges enabled.

QuickTime Streaming Server

- Resolves an SSL-related authentication issue that resulted in the message "The connection was refused when attempting to contact 127.0.0.1:1220".

Networking

- Improves data network performance and transfer rates using IP over FireWire, most noticeable in high-bandwidth usage scenarios.
- For computers other than Xserve, adds support for IP over Firewire, allowing Mac OS X Server to connect to other capable devices via existing IP protocols over Firewire. (Xserve already had this feature, which was introduced for it in January, 2003.)

Core OS

- Mac OS Standard (HFS) CD volumes may be shared using Workgroup Manager.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Mac OS X Server: About the Mac OS X Server 10.2.5 Update (Combo)

This software updates Mac OS X Server 10.2, 10.2.1, 10.2.2, 10.2.3, or 10.2.4 to version 10.2.5. It is a "combo" update that combines enhancements delivered with versions 10.2.1 through 10.2.5. If you already have Mac OS X Server 10.2.4, you may download a smaller update that is not a combo.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X Server 10.2.5, you must enter the password for an Admin account. The password cannot contain a space or special characters typed by pressing the Option key.

   If you need to change an Admin account password, choose Apple menu > System Preferences, then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X Server 10.2.5.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Featured Software (http://www.apple.com/swupdates/).

There are two versions of the update installer available:

- "Mac OS X 10.2.5 Server Update (Combo)" updates Mac OS X Server 10.2, 10.2.1, 10.2.2, 10.2.3, or 10.2.4 to version 10.2.5. This document describes how to use this installer.
- "Mac OS X Server 10.2.5 Update" updates only Mac OS X Server 10.2.4 to the new version. To learn more about that installer, see technical document 107491, "**Mac OS X Server: About the Mac OS X Server 10.2.5 Update**".

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with Mac OS X Server versions 10.2.1 through 10.2.5. These enhancements are listed individually in these technical documents:

107038: "**Mac OS X Server: About the Mac OS X Server 10.2.1 Update**"
107142: "**Mac OS X Server: About the Mac OS X Server 10.2.2 Update**"
107265: "**Mac OS X Server: About the Mac OS X Server 10.2.3 Update**"
107364: "**Mac OS X Server: About the Mac OS X Server 10.2.4 Update**"
107491: "**Mac OS X Server: About the Mac OS X Server 10.2.5 Update**"
Published Date: Oct 7, 2016

Macintosh Manager 2: Cannot Check In a Checked Out Computer

If a Macintosh Manager Administrator or Workgroup Administrator checks out a client Macintosh Manager computer, the computer can no longer be checked in.
This article has been archived and is no longer updated by Apple.

Symptom

The user who checked out the Macintosh Manager client does not appear in the user list and thus cannot log in or check the computer in. The user who checked out the client cannot check out any other Macintosh Manager client computers.

Solution

1. Open the Macintosh Manager application, and connect to the server.
2. Click the Computers tab.
3. Select the Machine List that the affected client is on, then click the Log-In tab.
4. Deselect the checkbox for "List displays users only (no administrators)".
5. Click Save.
6. On the affected client, log in with System Access. For reference, see technical document 106901, "**Macintosh Manager 2: How to Gain System Access**".
7. Delete the folder:

   Macintosh HD: System Folder:Preferences:Multiple-Users:Multi-User Items Cache

8. Be sure the affected client is connected to the Macintosh Manager network.
9. Log out of System Access (choose Special > Log Out, or press Command-Q).
10. A message that the server is not set up for use (Figure 1) appears. Click Stop.

Figure 1 Server not in use dialog

11. A dialog asks if you would like to select a different server. Click Yes.
12. The Available Servers dialog appears. Select your Macintosh Manager server, then click Choose.

You should see a list of all the Macintosh Manager users, and you should be able to check the computer in.

Note: If this results in a situation in which you can log in but not check the computer in (or cannot check out a different computer), then you should follow the additional procedure in technical document 107495, "**Macintosh Manager 2: Cannot Check Out a Computer**".

Additional information

This situation occurs when the Machine List to which the Macintosh Manager client computers belong is set by default not to display Macintosh Manager Administrator or Workgroup Administrator user types. You can change the Macintosh Manager login window to show All Users, Macintosh Manager Administrators, or Workgroup Administrators. After checking out the computer, though, the login dialog returns to the default. Since you will not see the user who checked out the computer, you will not be able to check it in or even log in. Therefore, the checkout feature is not compatible with the feature for hiding Administrator type users from the login dialog.
Published Date: Feb 17, 2012

Mac OS X Server 10.2.3: How to Install on Power Mac G4 (FW 800) or eMac (ATI Graphics)

This document explains how to use a Mac OS X Server 10.2.3 installation CD on a Power Mac G4 (FW 800) or eMac (ATI Graphics) computer.
This article has been archived and is no longer updated by Apple.

Notes

1. Follow these instructions exactly. If you do not, the process may not be completed.

2. This procedure requires the Mac OS X Server 10.2.3 CD. Installing from an earlier version of the CD is not supported for these computers.

3. The Mac OS X Server 10.2.3 CD cannot be used as a startup disc, so the installer will be used while started up from the computer's hard disk.

Follow these steps to install:

1. Complete the Mac OS X Setup Assistant on the target computer, if you have not already done so.

Note: The user name and password you choose here will also be the administrator account name and password created for the server software.

2. Use the Software Update feature to check for any available updates, and install them if applicable. Be sure to check again after each update, since additional software may have become available. For help with this step, see technical document 106704, "**Mac OS X: How to Update Your Software**".

3. Insert the Mac OS X Server 10.2.3 CD.

4. Find the folder named "MacOSXServerInstall" on the root level of the CD (Figure 1), and open it.

Figure 1 Contents of the Mac OS X Server 10.2.3 CD

5. Double-click the installer package named "MacOSXServerInstall.mpkg".

6. After the installation process is finished, restart the server.

7. Complete the Mac OS X Server Setup Assistant.

8. When the Open Directory Setup Assistant appears, you must authenticate with the Admin user name and password. Select the option for "Temporary IP Address", and complete the assistant.

9. Restart the server again.

10. Use the Software Update feature to check for and install available updates. Be sure to check again after each update, since additional software may have become available. If for some reason Software Update does not display available updates, download a standalone installer from Apple Featured Downloads (http://www.apple.com/swupdates/).

Note: At this point, the latest version of Mac OS X that you installed in step 2 and the latest version of Mac OS X Server that you installed in this step should be the same.

11. If desired, you may now use Open Directory Assistant. It is located at /Applications/Utilities/.

This completes the installation process.

AirPort Extreme: Card‘s Name Does Not Appear in Apple System Profiler

Apple System Profiler either does not display a name for the AirPort Extreme Card, or labels the card as "Slot B". This is a cosmetic omission. It does not mean that something is wrong with your system.
This article has been archived and is no longer updated by Apple.

Symptom

- No name appears for the AirPort Extreme Card in Apple System Profiler.
- Apple System Profiler labels the AirPort Extreme Card as "Slot B".

Solution

To check that you are reading information for the AirPort Extreme Card, compare the MAC address you see in Apple System Profiler with the one that appears in the Network pane of System Preferences.

Published Date: Feb 19, 2012

Mac OS X Server: Mac OS 9 clients may connect to only one Apple File Service (AFP) Volume

In certain situations, Mac OS 9 clients may fail to connect to (mount) additional AFP volumes after successfully connecting to one from the same server. This issue only occurs with the Apple File Service implementation of AFP in Mac OS X Server. It does not occur if the AFP server is Mac OS X client file sharing.
This article has been archived and is no longer updated by Apple.

Symptom

This is an example scenario:

1. A Mac OS 9 client selects AppleShare in the Chooser and connects to a Mac OS X Server AFP share point.
2. Later, the client again tries to connect to another AFP volume from the same server in the same manner, without first putting away (unmounting) the first volume.
3. When the "already connected" dialog appears with the list of available share points, the client sees a message that says: "server failed to respond" or a similar message.

Solution

This symptom occurs when the server replies to the client with an AFP packet that is too large for the Mac OS 9 client to understand. Certain configurations on the server may cause the reply packet to be large enough to cause this symptom:

- Secure Connections (AFP over SSH) enabled
- TIM enabled (Mac OS X Server 10.2 and earlier)
- Long server name
- Multiple Ethernet interfaces configured

To work around the issue:

1. Put away all of the volumes on the client side.
2. Reconnect and select all of the volumes you want to use at once, rather than in succession.

Apple Remote Desktop 1.2 or later: How to Optimize Performance of Observe and Control Feature

You can optimize the performance of the Observe and Control feature by setting the observed computer to Thousands of colors in the Displays preference pane. This achieves the best refresh rates when observing and controlling.

This article has been archived and is no longer updated by Apple.

To change the color depth at the client computer, follow these steps:

1. Choose Apple menu > System Preferences.
2. Choose View > Displays.
3. Choose Thousands from the Colors pop-up menu.

You can also follow these steps remotely while controlling the client via Apple Remote Desktop.

Note: If you are using Apple Remote Desktop over a dial-up or ISDN connection, you may wish to use Preferences to choose black and white instead of color.

Published Date: Feb 17, 2012

Mac OS X Server 10.2: Group Folders Require Full Path to Share Point

When you configure a Group Folder, you must specify the full path to the share point.
This article has been archived and is no longer updated by Apple.
When configuring a Group Folder using the Advanced option in Workgroup Manager, be sure to enter the full path to the share point in the URL field, not just the share point name.

For example, if a share point named "Students" is in the folder "HighSchool" at the root of the startup volume, the full path you would enter in the URL field would be:

```
afp://server.example.com/HighSchool/Students
```

If your share point is on another local volume, be sure to include /Volumes/<VolumeName> in the URL. For example, if a share point named "Students" is in the folder "HighSchool" at the root of the volume called "2ndDrive", the full path you would enter in the URL field would be:

```
afp://server.example.com/Volumes/2ndDrive/HighSchool/Students
```

Notes

1. The URL should always include the protocol to be used when configuring a Group Folder using the Advanced option. See technical document 107509, "**Mac OS X Server 10.2: Specify Protocol When Configuring Group Folder**".

2. Avoid using spaces in the full path when possible. See technical document 107254, "**Mac OS X Server: Do Not Use Spaces in Home Directory Share Point Name**" for more information on spaces in the home directory share point name.

AirPort Extreme: How to Print to a USB Printer From the WAN Port

This document explains how to set up your AirPort Base Station to allow access to its USB printer from the WAN port.

This article has been archived and is no longer updated by Apple.

In the default configuration, computers connected to the base station's WAN port are outside the base station's firewall, and are unable to access the base station's USB printer. There are two methods you can use to allow access to the USB printer from the WAN port. After using either of the methods below, computers connected via the WAN port should be able to access the base station printer in Print Center via Bonjour (formerly "Rendezvous").

Notes

1. If the WAN network connects to another router, printer access is only supported on the WAN subnet that is local to the base station. It is not supported for computers that are separated from the base station by a router.

2. USB printing through an AirPort Extreme Base Station requires Mac OS X 10.2.3 or later.

Turn on WAN-LAN bridging

If you have a computer on the WAN port that you would like to give access for USB printing, you can bridge between the LAN and WAN networks.

Note: When using this method, you will be dependent on Bonjour for all local network connectivity, or you will need to rely on a router that provides addresses for the connected computers.

Follow these steps to turn on WAN-LAN bridging on an AirPort Extreme Base Station:

1. Open the AirPort Admin Utility (/Applications/Utilities/).
2. Select your base station from the list.
3. Click the Configure icon.
4. Click the Network Tab.
5. Deselect the checkbox for "Distribute IP Addresses".
6. **Note:** If your AirPort Extreme Base Station has a built-in modem that you are using to connect to the Internet, WAN-LAN bridging is automatically turned on without the need to follow these steps. In that configuration, you may rely on the DHCP and NAT services provided by the base station for WAN, LAN and wireless clients.

Using WAN privacy to allow printer access

There may be reasons that you are be unable to bridge between the LAN and WAN networks. If unsure, check with your network administrator. When you cannot use WAN-LAN bridging, you may choose to use remote printer access from the WAN privacy settings. To do so, follow these steps:

1. Open AirPort Admin Utility (/Applications/Utilities/).
2. Select your base station from the list.
3. Click the Configure icon.
4. Click the Base Station Options button.
5. From the pop-up menu, select the checkbox for Enable Remote Printer Access.
6. Click Update.

Apple Remote Desktop 1.2: Cannot Remotely Update or Control Mac OS 9 ARD 1.1 Clients

Apple Remote Desktop 1.2 cannot administer Mac OS 9 ARD 1.1 clients. To update your clients remotely, you must update them first, then the administration software.
This article has been archived and is no longer updated by Apple.

Symptom

After updating to ARD 1.2 at your administration computer, you cannot administer ARD 1.1 client computers that use Mac OS 9.

Solution

If you have not yet updated any of your ARD software to version 1.2, you may avoid this issue by updating the client computers first. If you have already updated the administration computer first, there are two alternatives: You may either update the client computers locally, or you may reinstall ARD 1.1 at the administration computer.

I. Locally updating clients

This method may be easier if you have only a few affected ARD client computers. You may individually update each computer to ARD 1.2 by using the Software Update control panel or by using the standalone installer available from software download document 120206, "**Apple Remote Desktop 1.2 Client for OS 8.1 - 9.2: Information and Download**".

II. Reinstalling ARD 1.1

This method is easier when you have many affected ARD client computers. Follow these steps:

1. At the administration computer, uninstall ARD 1.2. To do this, see technical document 107159, "**Apple Remote Desktop: How to Uninstall**".

Note: If there is a secondary Mac OS X computer that does **not** already have ARD administration software installed but on which you would not mind having it installed, then you may continue to Step 2 at that computer without completing Step 1.

2. If you have the ARD 1.1 CD, reinstall the ARD 1.1 administration software. If you have the ARD 1.0 CD, please contact AppleCare Technical Support for assistance with installing ARD 1.1.

Note: If prompted to update, be sure not to update to version 1.2.

3. Download the update from software download document 120206, "**Apple Remote Desktop 1.2 Client for OS 8.1 - 9.2: Information and Download**".

4. On the update disk image, look in the Remote Desktop Parts folder and locate the Remote Desktop Startup extension.

5. Open the ARD 1.1 application.

6. Select the affected client computers from the Computer Status list.

7. Copy the Remote Desktop Startup extension to the selected computers, with a destination of:

System Folder: Extensions

8. Restart the selected client computers.

9. Update the administration software to version 1.2, using the Software Update pane of the System Preferences application.

Published Date: Oct 7, 2016

AirPort Extreme Base Station is not Available in AirPort Admin Utility on certain computers

System software included with certain computers allows them to join AirPort Extreme networks. At the same time, they may not being able to use the AirPort Admin Utility with the base station. A software update resolves the issue.
This article has been archived and is no longer updated by Apple.

Symptom

You can connect to an AirPort Extreme network, but the base station is not available in AirPort Admin Utility.

Solution

The AirPort software on the computer needs to be updated to version 3.0. This software is included on a CD that comes with the AirPort Extreme Base Station. It is also available from Apple Featured Software (http://www.apple.com/swupdates/).
Published Date: Oct 7, 2016

Apple Remote Desktop 1.2: Automatic Software Update Stops Responding During Installation

When using the Software Update preference pane, the Apple Remote Desktop 1.2 installation may stop responding ("hang"). This may occur just as the "optimizing" process is finished.
This article has been archived and is no longer updated by Apple.

Symptom

Software Update stops responding when you install Apple Remote Desktop 1.2 on a computer with Mac OS X 10.1.4. This may occur just after optimization is completed.

Note: This issue may be avoided by updating to Mac OS X 10.1.5 prior to updating Apple Remote Desktop.

Solution

When this occurs after optimization, the software has actually been installed. To resolve the responsiveness issue, follow these steps:

1. Choose Apple menu > Force Quit.

   Note: If the Finder is not responsive, try pressing Command-Option-Escape to open the Force Quit dialog.

2. Select Software Update, and click Force Quit.
3. Quit and reopen System Preferences.
4. Verify the addition of the Remote Desktop preference pane to the Internet and Network section of System Preferences. This verifies that the software was installed.

Published Date: Oct 7, 2016

Apple Remote Desktop: Cannot Shut Down or Restart Client Computer at Login Window

With version 1.1 or earlier of the Remote Desktop application, you cannot use the Shut Down or Restart commands on a client computer that does not have a user logged in.
This article has been archived and is no longer updated by Apple.

Symptom

If an Apple Remote Desktop client computer is at the Login Window, the Remote Desktop application cannot restart it or shut it down.

Solution

Update the administration and client computers to Apple Remote Desktop 1.2.
Published Date: Oct 7, 2016

Apple Remote Desktop 1.2: How to Update Mac OS X Clients That Do Not Have Internet Access

This article discusses how to update client computers that do not have Internet access to Apple Remote Desktop (ARD) 1.2.

Note: At least one administration computer must have Internet access.
This article has been archived and is no longer updated by Apple.
The Remote Desktop 1.2 administration application can update Mac OS X clients ARD 1.1 clients to version 1.2. The clients do not need to be connected to the Internet to do this. After updating the administration computer, the Remote Desktop application will prompt you to update Mac OS X clients when you are at the Computer Status window.

If one administration computer is unable to reach the Internet, you may use another administration system that is able to reach the Internet to download the ARD updater package. You may follow these steps at that computer:

1. Open System Preferences.
2. Choose View > Software Update.
3. Click Update Now.
4. Select the checkbox for the ARD Update.
5. Choose Update > Download Checked Items to Desktop.

Note: The downloaded update package should only be used on a computer that has the same versions of Mac OS X and ARD as the computer on which you download it (version of ARD in this instance refers to administration or client; version of Mac OS X refers to 10.1.x or 10.2.x).
Published Date: Oct 7, 2016

Mac OS X 10.2.5: Unable to Log In After Deleting NIS Server Entry

You may not be able to log in after you delete an NIS server entry in the Directory Access application.
This article has been archived and is no longer updated by Apple.

Symptom

Mac OS X startup stalls at the message "Waiting for Network Information Service", or Login Window will not accept any local or network user name and password combinations.

Solution

This occurs because incomplete information remains in the NIS pane of the Directory Access application. When deleting information from this pane, be sure to delete it all. Note that adding an NIS server entry in Directory Access may insert one or more blank lines after the NIS server address. Note the position of the cursor in Figure 1.

Figure 1 NIS pane of Directory Services

If you remove the server address without removing the blank line(s), then Login Window will be unable to authenticate local or network accounts. If you remove the server address without removing the domain name, the startup process will stop responding at the "Waiting for Network Information Service" message.

To avoid this problem, be sure to select and delete all blank line(s) in the field in addition to the NIS server IP address and domain name.

After encountering this problem, you may resolve it by logging in as root at the client computer and removing any blank lines from the NIS configuration in the Directory Access application. This solution will only work if the root account is currently enabled on the client. For more information, including how to log in as root, see technical document 106290, "**Mac OS X: About the root User and How to Enable It**".

If the root account is not enabled, or you cannot reach the login window, you may use the following steps to recover. In these steps, you will type a series of text commands. Each command below is preceded by the pound sign (#). After each command, press the Return key to execute it.

Warning: Misuse of the "rm" command may result in severe data loss. If you are not comfortable performing these steps, seek assistance before continuing. Even if you cannot log in to the computer, you may wish to back up data before continuing (by using Target Disk Mode, for example, or other methods).

Steps to recover:

1. Start up into single-user mode. For help with this step, see technical document 106388, "**Mac OS X: How to Start up in Single-User or Verbose Mode**".
2. Check the volume with fsck. For instructions, see technical document **106214**.

3. Execute this series of commands at the text prompt:

```
# mount -uw /
# cd /var/yp/binding
# ls
```

Note: This will list the contents of the binding directory, including a file whose name is in the format:

```
<domain>.ypservers
```

In this example, "<domain>" represents the actual name of the NIS domain that was configured in Directory Access.

4. Execute this command:

```
# rm <domain>.ypservers
```

Note: You must replace "<domain>" with the name of the domain listed at the end of Step 2.

5. Enter the following command:

```
# more /etc/hostconfig | grep NIS
```

Note: The "|" character above is the "pipe," located above or below the Return key on most keyboards. This command will generate text output. If the output from is "NISDOMAIN=-NO-", then skip to Step 6.

6. Execute the following commands:

```
# mv /etc/hostconfig /etc/hostconfig.nis.old
# sed 's/NISDOMAIN=.*/NISDOMAIN=-NO-/g' /etc/hostconfig.nis.old > /etc/hostconfig
```

Note: These commands will change your hostconfig file to remove a reference to the NIS server, while also creating a backup copy of the original file. You can also use a command-line text editor such as pico to manually change the NISDOMAIN line in the hostconfig file to:

```
NISDOMAIN=-NO-
```

7. Execute this command:

```
# exit
```

The computer will restart normally, and you can log in using a local account.
Published Date: Oct 7, 2016

Mac OS X Server 10.2: NetBoot or Network Install Image Does Not Work Properly If Permissions Not Enabled on Source

If the source volume for a NetBoot or Network Install disk image does not have permissions enabled when the image is created, client computers will not start up properly from the resulting image.
This article has been archived and is no longer updated by Apple.

Symptom

Client computers cannot start up from the NetBoot or Network Install image.

Solution

To prevent this issue from occurring, be sure that permissions are enabled for the source volume. You may use Disk Utility to repair an existing image or client installation that is affected by this issue.
I. Prior to creating an image, click here.
II. To repair an existing image, click here.
III. To repair an existing client installation, click here.

I. How to enable permissions for a volume

Permissions are enabled by default for some types of volumes but disabled by default for others, to correspond with the way that the volume is most likely to be used. Some operating system installation CDs, for example, may have permissions enabled by default. Since you cannot change a write-only CD, remember that any change made to the permissions setting for a CD is stored on the computer where the change is made. To be sure permissions are enabled for any volume, follow these steps prior to creating a NetBoot or Network Install image:

1. Insert or connect the volume to be imaged (if applicable). Example: If you are creating a Network Install image of Mac OS X 10.2, insert Disc 1 of the Mac OS X Install CD set.
2. Click the Finder icon in the Dock.
3. Choose Go > Computer.
4. Select the volume to be imaged.
5. Choose File > Get Info.
6. In the Info window, click the disclosure triangle for Ownership & Permissions.
7. Be sure that the checkbox for "Ignore ownership on this volume" is NOT selected, then close the Info window.

Note: If you are creating an image from a multi-CD set, repeat the steps for each CD prior to making an image from them. Example: If you plan to use Disc 2 of the Mac OS X Install CD set for your Network Install image, eject Disc 1, and repeat the steps above for Disc 2.

You may now create the image using the directions from the Mac OS X Server Admin Guide. You can download the latest version of the Admin Guide from the Apple Manuals page (http://www.info.apple.com/support/manuals.html).

II. How to repair an existing image

To repair an existing NetBoot image, follow these steps at the server:

1. Open Disk Copy (/Applications/Utilities/).
2. Drag the image file into the Disk Copy window to mount it.
3. Open Disk Utility.
4. Click the First Aid tab.
5. Select the volume to be repaired.
6. Click the Repair Disk Permissions button.

Note: Network Installation image permissions cannot be repaired and requires recreation in order to properly function.

III. How to repair a client installation

To repair permissions on a client installation, use the diskutil tool in Terminal. Follow these steps at the client computer:

1. Open Terminal (/Applications/Utilities/).
2. Type: `sudo diskUtil repairPermissions /`
3. Press Return.

4. Type your Admin user account password when prompted, then press Return.
5. Quit Terminal.

Published Date: Oct 7, 2016

Mac OS X Server 10.2: NetBoot Clients Get "Error -36" When Connecting to Server

If the source volume of the NetBoot image did not have privileges enabled, NetBoot clients get an "Error -36" alert message when trying to connect to an Apple Filing Protocol (AFP) server.

Note: Apple File Service, AppleShare, File Sharing, and Personal File Sharing are all examples of AFP service.
This article has been archived and is no longer updated by Apple.

Symptom

A NetBoot client displays an "Error -36" alert message when trying to connect to an AFP volume.

Solution

Privileges should be enabled on the source volume prior to making a NetBoot image. To repair file permissions on an existing image, use the Repair Privileges feature of Disk Utility.

For more information, including steps on how to enable permissions, see technical document 107524, "**Mac OS X Server 10.2: NetBoot or Network Installation Image Does Not Work Properly if Permissions Not Enabled on Source**".
Published Date: Oct 7, 2016

Mac OS X Server: A Group Cannot Own a Share Point

In AppleShare and Mac OS versions prior to Mac OS X, a group could be specified as the owner of a shared folder or volume. This feature is not available in Mac OS X.
This article has been archived and is no longer updated by Apple.
Mac OS X and Mac OS X Server use Unix-style permissions on files and folders. In this system, only a user can be the owner of a file or folder. Therefore a group cannot be assigned as the owner of a share point.

For more information about permissions in Mac OS X and Mac OS X Server, see Knowledge Base article 106712, "**Mac OS X: Troubleshooting Permissions Issues**".
Published Date: Oct 7, 2016

Mac OS X Server: About the Mac OS X Server 10.2.6 Update

This software updates Mac OS X Server 10.2.5 to 10.2.6.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin user and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install. Installation

Installation

There are two ways to update to Mac OS X Server 10.2.6.

Automatic Software Update

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Software Downloads (http://www.apple.com/swupdates/).

Two versions of the installer are available. One is for updating version 10.2.5 to 10.2.6; the other updates version 10.2, 10.2.1, 10.2.2, 10.2.3, 10.2.4, or 10.2.5 to 10.2.6 (a "Combo" update). This document describes the former. If you need to use the Combo update, see technical document 107532, "**Mac OS X Server: About the Mac OS X Server 10.2.6 Update (Combo)**".

Enhancements delivered with this update

This update delivers the enhancements outlined below. This installer is server-specific, but the issues it resolves are not. This update provides the same fixes found in the client version of the Mac OS X 10.2.6 Update. The issues described below are relevant in a server setting, but you must also update the client computers.

File Services

- Provides more reliable software installation for a client computer that is installing from a file located on a remote Apple Filing Protocol (AFP) server volume.
- Improves AFP client copy reliability, resolving an issue in which a file could have become unusable after copying via AFP in certain circumstances.
- Improves compatibility with Microsoft UAM (User Authentication Module) 1.0.2 when connecting to Windows share points.

Core OS

- Addresses a rare condition in which users cannot complete the login process.
- Improves compatibility with some USB devices, providing greater system reliability.

Printing

- Improved CUPS printing experience for Hewlett Packard LaserJet 8150 DN laser printer, allowing full text and image print by default.

Mac OS X Server: About the Mac OS X Server 10.2.6 Update (Combo)

This software updates Mac OS X Server 10.2, 10.2.1, 10.2.2, 10.2.3, 10.2.4, or 10.2.5 to version 10.2.6. It is a "combo" update that combines enhancements delivered with versions 10.2.1 through 10.2.6. If you already have Mac OS X Server 10.2.5, you may download a smaller update that is not a combo.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X Server 10.2.6, you must enter the password for an Admin account. The password cannot contain a space or special characters typed by pressing the Option key.

   If you need to change an Admin account password, choose Apple menu > System Preferences, then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X Server 10.2.6.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Featured Software (http://www.apple.com/swupdates/).

There are two versions of the update installer available:

- "Mac OS X 10.2.6 Server Update (Combo)" updates Mac OS X Server 10.2, 10.2.1, 10.2.2, 10.2.3, 10.2.4, or 10.2.5 to version 10.2.6. This document describes how to use this installer.
- "Mac OS X Server 10.2.6 Update" updates only Mac OS X Server 10.2.5 to the new version. To learn more about that installer, see technical document 107531, "**Mac OS X Server: About the Mac OS X Server 10.2.6 Update**".

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with Mac OS X Server versions 10.2.1 through 10.2.6. These enhancements are listed individually in these technical documents:

107038: "**Mac OS X Server: About the Mac OS X Server 10.2.1 Update**"
107142: "**Mac OS X Server: About the Mac OS X Server 10.2.2 Update**"
107265: "**Mac OS X Server: About the Mac OS X Server 10.2.3 Update**"
107364: "**Mac OS X Server: About the Mac OS X Server 10.2.4 Update**"
107491: "**Mac OS X Server: About the Mac OS X Server 10.2.5 Update**"
107491: "**Mac OS X Server: About the Mac OS X Server 10.2.6 Update**"
Published Date: Oct 7, 2016

Apple Remote Desktop: "Computers" Setup Window Does Not Appear

In some situations the "Computers" setup window may not appear. This is the window that should appear when you choose Setup > Computers, or that appears the first time you use the Remote Desktop application.
This article has been archived and is no longer updated by Apple.

Symptom

The Computers setup window does not appear when it should.

Solution

Remote Desktop may not display the Computers window when the following file is missing or unusable:

~/Library/Preferences/com.apple.security.plist

Remote Desktop stores information on added client computers and computer lists in the user's keychain (~/Library/Keychains/).

The file "com.apple.security.plist", which is saved in ~/Library/Preferences/, contains a reference to the user's keychain. If this file is missing or unusable, Remote Desktop may "lose" the added client computers and computer lists. Additionally, Remote Desktop will not display the Computers window when this file is missing or unusable.

Important: In following these steps, you will make a copy of the original preference file, edit it, then replace the original with the copy. If at any point you think you have made a mistake or any unintended change, close the copy without saving changes and return to Step 5.

1. Locate the file: `~/Library/Preferences/com.apple.security.plist`
2. Select the file in the Finder window.
3. Choose File > Duplicate.
4. Open TextEdit.
5. Choose File > Open.
6. Type: `~/Library/Preferences/com.apple.security copy.plist`
7. Click Open.
8. Verify that the "DefaultKeychain" key is present in the file. Here is a sample of the "DefaultKeychain" key to look for:

```
<key>DefaultKeychain</key>
<array>
     <dict>
          <key>DbName</key>
          <string>~/Library/Keychains/username</string>
          <key>GUID</key>
          <string>{87191ca3-0fc9-11d4-849a-000502b52122}</string>
          <key>SubserviceType</key>
          <integer>6</integer>
     </dict>
</array>
```

9. You likely see that "DefaultKeychain" key is not present, but the "DLDBSearchList" key is present. If so, continue to the next step. (If not, then another issue may be the cause. Consider contacting Apple Technical Support in this case.)
10. Copy the "DLDBSearchList" key information, starting with and including the "<key>", through and including the "</array>" tag.
11. Paste it in a new line after the last "</array>" of the file.
12. In the pasted text, change "`<key>DLDBSearchList</key>`" to read:

```
<key>DefaultKeychain</key>
```

13. Save the file.
14. Before replacing the files, be sure that the Remote Desktop application is not open.
15. In the Finder, open your Preferences folder (~/Library/Preferences/)
16. Rename "`com.apple.security.plist`" to:

```
com.apple.security.plist_old
```

17. Rename "`com.apple.security copy.plist`" to:

```
com.apple.security.plist
```

Mac OS X 10.2: LDAP Users Cannot Log In, Computer Stops Responding at Login Window

When you click a user name in the Login Window of an LDAP client computer, it may briefly appear to be logging in. However, the computer becomes unresponsive (a "hang") at the progress bar, and the user is not logged in. LDAP accounts cannot log in in this circumstance.
This article has been archived and is no longer updated by Apple.

Symptom

When you click a user name at the Login Window, it skips the password dialog and briefly appears to be logging in. The window shakes (which normally indicates incorrect password), and the system stays at the progress bar. To be able to log in as a local user after this occurs, you must force the computer to restart by pressing the power button, reset button, or appropriate keyboard shortcut as applicable to the computer model.

Solution

This happens specifically when the computer is an LDAP client and the attribute for the LDAP directory service being used is not mapped. Some LDAP servers do not store the user password in Directory Services. If the password attribute for users is not mapped, login is tried without a password and thus cannot succeed.

Follow the steps below at each affected client computer. To log in to an affected computer, select a local administrator account at the Login Window, not an LDAP user account. After logging in, follow these steps:

1. Open Directory Access (/Applications/Utilities/).
2. Click the Lock button to authenticate.
3. Select LDAPv3.
4. Click Configure.
5. Select the relevant LDAP configuration from the list.
6. Click Edit.
7. Click the "Search and Mappings" tab.
8. Click the disclosure triangle next to Users.
9. Scroll down to the Password attribute, and select it.
10. Click the rightmost Add button. (This should reveal a text field with a blinking cursor in the field beneath "Map to <menu> items in list".)
11. Type: `#********`
12. Click OK.
13. Quit Directory Access.

Published Date: Feb 17, 2012

Mac OS X Server 10.2: MySQL Will Not Start

This document explains what to do if MySQL will not start when you click the Start button in MySQL Manager.
This article has been archived and is no longer updated by Apple.

Symptom

When you click the Start button in MySQL Manager, nothing happens. Normally, the button changes from Start to Stop after MySQL starts.

Solution

This usually happens when the host name of the server is set to something other than its DNS name. This prevents the database from being created, as you may verify by reading the ".err" files at /var/mysql/. If you cannot fix your DNS configuration, then follow these steps to create the database files:

1. Open Terminal (/Applications/Utilities/).
2. Each of the following commands is preceded by the number sign (#), which represents the prompt you see on screen. Type each command, pressing Return before continuing to the next:

```
# sudo mysql_install_db --force
# sudo chown -R mysql:admin /var/mysql
# sudo chmod -R o- /var/mysql
# sudo safe_mysqld &
# sudo mysqladmin -u root password <new_pwd>
```

Note: Replace "<new_pwd>" with your actual new password of choice. If your new password was "p$ssw*rd", then you would type:

```
sudo mysqladmin -u root password p$ssw*rd
```

3. Quit Terminal.

Apple Remote Desktop 1.2: Control Lost When Logging Out of the Client Computer

During a Control session, you may occasionally lose your control connection after you log out the client computer. This document contains some workarounds for this situation.
This article has been archived and is no longer updated by Apple.

Symptom

During a Control session, if you choose the Log Out command for the client computer, you may lose your control connection.

Solution

Use one of several workarounds.

First, try closing the Control window and simply starting a new Control session. This should work in most cases.

If that does not work, either restart the client computer or use SSH to restart the ARD agent process, whichever you prefer.

Note: To use SSH, Remote Login must have previously been selected in the Sharing preference pane of the client computer.

To use SSH, follow these steps:

1. Open Terminal (/Applications/Utilities/).
2. Type: `ssh <client_address>`
Note: replace "<client_address>" with the actual DNS name or IP address of the client computer.
3. Press Return.
4. Complete the authentication dialog. You may or may not see an RSA key warning.
5. Type: `ps -auxwww | grep ARD`
6. Press Return. If the ARD processes are running, the output will include:

```
root   344   0.0  0.0     1552    100  ??  Ss   15Apr03   0:04.25 /System/Library/CoreServices/ARD Helper
root   633   0.0  0.7    42512   1784  ??  S    15Apr03   5:29.80 /System/Library/CoreServices/ARD
Agent.app/Contents/MacOS/ARD Agent -psn_0_524289
```

7. If either of the above processes is not running, type:

```
sudo /System/Library/StartupItems/RemoteDesktopAgent/RemoteDesktopAgent
```

8. Press Return. This restarts the processes. Repeat the ps command to verify that they are restarted.

Mac OS X Managed Client: Stops Responding During Login When Using Custom Desktop Picture

A managed client may stop responding ("hang") during login when a custom desktop picture has been set and applications are managed.
This article has been archived and is no longer updated by Apple.

Symptom

After a user authenticates at the Login Window, the progress bar appears as if logging in, but the computer stops responding at the progress bar.

Solution

Use SSH to recover from the unresponsive state. Remote Login must have previously been selected in the Sharing preference pane of the client computer. Follow these steps:

1. Open Terminal (/Applications/Utilities/) at another computer.
2. Type: `ssh <client_address>`
Note: Replace "<client_address>" with the actual IP address or DNS name of the client computer.
3. Press Return.
4. Complete the authentication dialog, using an administrator account of the target computer. You may or may not see an RSA warning message.
5. Type: `sudo killall loginwindow`
6. Press Return.
7. Enter the administrator account password when prompted, and press Return.
8. Type: `sudo rm ~<shortname>/Library/Preferences/com.apple.desktop.plist`
Note: Replace "<shortname>" with the short name of the affected user who selected the custom picture.
9. Press Return.

The user should now be able to login.

The following steps prevent users from accessing the Desktop preference pane and changing their Desktop Picture.

1. Open Workgroup Manager.
2. Choose View > Preferences.
3. Click the Users, Groups, or Computers tab.
4. Be sure a user, group, or computer list is selected.
5. Click the System Preferences icon.
6. For "Manage these settings", select the Always option.
7. Deselect the checkbox for the Display preference pane.
8. Click the Apply Now button.

Note: A user still can manually edit the ~/Library/Preferences/com.apple.desktop.plist file, causing the same issue.

This document will be updated when more information becomes available.

Energy Saver: How to Use the "Wake for administrator access" Feature

There are several ways to remotely wake a computer from sleep when the "Wake for network administrator access" option is selected in Energy Saver. Applicable routers must be configured to allow directed broadcast of the wake-on-LAN (WOL) packet, also known as a "magic packet". This article has been archived and is no longer updated by Apple.
Note: To wake a remote computer, any intervening router must be configured to allow directed broadcast. If you need help configuring a router, see documentation provided by the router manufacturer.

To remotely wake an eligible computer from sleep, use one of these applications:

Apple Remote Desktop
http://www.apple.com/remotedesktop/

Wake550, by Five Fifty Software
http://www.tc.umn.edu/~olve0003/wake550.html
For additional information, see technical document 25414, "**Mac OS X: 'Wake for Network Administrator Access' Option Is For Ethernet Only**".

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Xserve RAID: Link and Activity Lights May Not Be Active Immediately After AC Power Interruption

After an AC power interruption, some indicator lights on the front panel may remain off for a while. The Xserve RAID otherwise works normally, and the lights eventually come back on.
This article has been archived and is no longer updated by Apple.

Symptom

Though the Xserve RAID is otherwise working normally, you see these symptoms:

- The fibre link channel lights are not on.
- The host channel activity lights are not on.
- The RAID Admin application reports "Controller not ready".

Solution

If the Xserve RAID has the optional Cache Battery Backup Modules, this may occur after an unplanned AC power interruption. You should not see these symptoms if you use the RAID Admin application to shut down prior to turning AC power on and off.

These symptoms do not indicate that anything is wrong with your system. If the RAID otherwise appears to be working normally, you should continue to use it. The lights should return to their normal behavior after a period of use.

This document will be updated when more information is available.
Published Date: Feb 19, 2012

Mac OS X Server 10.2, 10.3: Password authentication options for networked environments

Mac OS X 10.2 and later support a variety of popular standards-based authentication protocols. Here's an overview.
This article has been archived and is no longer updated by Apple.
Note: For information on Mac OS X Server 10.3 or later, please see the "User Authentication With Open Directory" section of the Open Directory pdf available at the **Apple Server Documentation** page. The remainder of this document describes version 10.2.

"Authentication" verifies a user's identity. It ensures an individual is who she claims to be. Mac OS X 10.2 supports popular standards-based authentication protocols to ensure that only valid, sanctioned users can access the services on your network.

Mac OS X 10.2 provides four distinct password options for network administrators to authenticate network users:

- Open Directory
- Password Server
- Kerberos
- NetInfo

Review these descriptions of Mac OS X 10.2 password authentication options to assist in making the proper decisions for your networks. Regardless of which method you choose, remember to also consider these other standard security practices.

Open Directory

Open Directory is Apple's open-source, standards-based directory system. It provides the flexibility to work with popular password authentication standards. Mac OS X 10.2 client and server use Open Directory in all user-group and authentication interactions.

Open Directory can work with a wide range of directory systems, and the password management options vary along with the directories configured by the network administrators. For example, if Open Directory is configured to work with an LDAP server, then the password verification and security is dependent on the LDAP server.

Note: Use caution when choosing a non-Apple directory service. Authentication standards and quality may vary according to the capabilities and configuration of the directory system.

Password Server

Password Server is a Simple Authentication and Security Layer (SASL) based password management system. You can give users a single user name and password combination for accessing all authorized resources on the network. Password Server also works with Workgroup Manager to help you set up and manage password policies, such as:

- Forcing users to change passwords the next time they log in.
- Expiring user accounts after a certain date.
- Enforcing minimum password lengths.
- Disabling inactive accounts after a period of no use.

Client-side Password Server software was added in Mac OS X 10.2. All services in Mac OS X 10.2 Server take complete advantage of it. For added security, Password Server does not transmit the password over the network; it simply indicates whether a given user name and password pair is correct. With the Password Server there is no encrypted hash stored in the user record. Rather, password verification is done via a secure network connection to the Password Server, which is set up and configured by a network administrator. Access to the password hash database is very restricted; it is protected even from remote network administrators. Password Server logs all network activity and provides implementation of "best practices" for password management and security. For a full discussion of the Password Server, see the Mac OS X 10.2 Server Administration Guide.

Kerberos

Kerberos is a popular authentication system that Mac OS X 10.2 can fully support as its primary authentication system. Full implementation of MIT Kerberos client authentication services enables single user sign-on to all authorized systems and network services. Mac OS X 10.2 users can access networks secured by Kerberos v4 and v5 servers and appreciate the benefits of Kerberized applications such as Mail, FTP, Telnet, and the AFP (Apple Filing Protocol) client.

If you have an established Kerberos site, you should consider using Mac OS X 10.2 with Kerberos as a password management alternative. Instructions for configuring Mac OS X 10.2 desktop and server can be found at the AppleCare website (http://www.apple.com/support/) and in Mac OS X 10.2 Server documentation.

NetInfo

Every Mac OS X computer has a local directory domain called NetInfo. Only local applications and system software can access administrative data for this local domain. It is the first domain consulted when a user logs in or performs some other operation that requires data stored in a directory domain.

When the user logs in to a Mac OS X 10.2 computer, Open Directory searches the computer's NetInfo database for the user's record. If NetInfo contains the user's record (and the user typed the correct password), the login process proceeds, giving the user access to the computer. This is the default behavior, but it can be changed by specifying an alternate search path in the Directory Access application.

User records are encrypted in the NetInfo database by using the UNIX crypt() function. Anyone with access to the system can access this encrypted data, so you should beware of potential exploit by experienced individuals. The encrypted data is most commonly viewed using one of four tools. It is advisable to change the permissions on these tools so that they are only executable by root and admin groups. This will limit the security exposure these password storage techniques represent. The four tools are:

- NetInfo Manager (Applications/Utilities)
- nidump (/usr/bin/nidump)
- nicl (/usr/bin/nicl)
- niutil (/usr/bin/niutil)

Additionally, Mac OS X 10.2 should be configured to prevent users from installing new software. This prevents someone from installing their own copy of these or equivalent tools.

Most importantly, administrators should encourage users to choose secure passwords. Administrators can assign passwords and prevent users from changing them by removing "_writers_password" properties in the NetInfo database.

Note: Local password hash form of password management is the required method for local user accounts and backwards compatibility with Mac OS 10.1

Standard Security Practices

Regardless of which authentication method you use, consider these additional security practices:

- Keep the server physically secured.
- Only allow trusted users with an administrator account access to the server.
- Use Open Firmware Password Security.
- Choose secure passwords.
- Remember that any local administrator account on the server can access the root account. Local administrator account and root account access provides opportunity for exploits that, depending on configuration, may not be available to remote users and administrators. This includes the ability to discover encrypted password hash.

AirPort 3.0.4 for Mac OS X 10.1.5: Contains Some Version 2.0.8 Components

AirPort 3.0.4 software for Mac OS X 10.1.5 includes both versions 3.0.4 and 2.0.8; this is normal.
This article has been archived and is no longer updated by Apple.

Symptom

After you download the AirPort 3.0.4 software, you see that:

- The unopened disk image file is named "AirPort 30410.1.5.dmg".
- The opened (mounted) disk image volume is named "AirPort 2.0.8".
- Included documentation references 3.0 software.
- The update includes version 2.0.8 of the AirPort Admin Utility and AirPort Setup Assistant.

Solution

AirPort 3.0.4 for Mac OS X 10.1.5 is a software group that coincides with the release of the 3.0.4 group for Mac OS X 10.2. The 2.0.8 components included with this update are the latest and most appropriate versions for Mac OS X 10.1.5.

Workgroup Manager: Sharing Button Is Dimmed

The Sharing button may be dimmed if you do not use correct upper and lower case letters when logging in.

This article has been archived and is no longer updated by Apple.

Symptom

The Sharing button is dimmed in Workgroup Manager.

Solution

When you log in, use the same letter case for your user name that was used when your account was created.

Published Date: Feb 20, 2012

Mac OS X Server: About starting and stopping web service with the apachectl script

You should be aware of certain behaviors, described below, when using the apachectl script to stop and start Web service.
This article has been archived and is no longer updated by Apple.
The default way to start and stop Apache on Mac OS X Server is to use the Web module of Server Settings. When you start Web service using Server Settings, the Watchdog startup item starts several processes, including one named serversettingsd, which is part of Server Settings. The serversettingsd process includes several plugins, including one for Apache. The Apache plugin checks the #AutoStartServer pseudo-comment in /etc/httpd/httpd_macosxserver.conf; if it's set to On, it raises the soft process limit and does "apachectl start".

If you want to use the apachectl script to start and stop Web service instead of using Server Settings, be aware of the following behaviors:

- The Web performance cache is on by default. When Web service starts, both the main Web service process (httpd) and a webperfcache process start. (The webperfcache process serves static content from a memory cache and relays requests to httpd when necessary.) The apachectl script that comes with Mac OS X Server is unaware of webperfcache. So if you have not stopped the performance cache, you also need to use the webperfcachectl script to start and stop webperfcache.
- The apachectl script does not increase the soft process limit beyond the default of 100. Server Settings raises this limit when it starts Apache. If your Web server receives a lot of traffic and relies on CGI scripts, Web service may not work when it reaches the soft process limit. In this case, you can start Web service using Server Settings, which sets the soft process limit to 2048. Alternatively, you can type "ulimit -u 2048" before using apachectl.
- The apachectl script does not start Apache automatically whenever the server restarts. To make sure that Web service is on after startup, use Server Settings. This behavior differs on a Mac OS X computer, where an Apache Startup Item is used in conjunction with a flag in the /etc/hostconfig file. (If you install a Software Update, it may contain content intended only for a Mac OS X computer, a harmless side effect as long as you don't add the flag to /etc/hostconfig that uses that content.)

Published Date: Feb 17, 2012

Mac OS X Managed Client: Can add printer, but can‘t print to it

This article has been archived and is no longer updated by Apple.

Sometimes managed clients can add a printer, but then they cannot print to it. Here's the specific sequence of events:

- You select Always as the management setting for Printer preferences, and "Allow user to add printers to the printer list."
- Users can add printers to the printer list in Print Center.
- However, the newly added printers don't appear in the list of available printers when a user tries to print a document.

The issue affects these products:

- Mac OS X Server 10.2 or later
- Workgroup Manager
- Mac OS X 10.2 and 10.3 managed clients

Solution

Users of Mac OS X managed client computers can add printers in Print Center, but a user-added printer does not appear in the Print sheet of any application, unless the printer is connected directly to the client computer's USB port.

In Workgroup Manager, an administrator can make additional printers available to specific users, groups, or lists of computers using the Printer List pane of Printer preferences.

Note: If "Allow user to add printers to printer list" is not selected, an administrator password is required to add or remove printers in Print Center.

Published Date: Feb 17, 2012

Mac OS X Server: Each User Connection Counts Against Server License Limit

A client computer may simultaneously connect to the server via Apple Filing Protocol (AFP) as two or more unique users. Each AFP user connection counts against the user limit allowed by the server license agreement.
This article has been archived and is no longer updated by Apple.

Symptom

In Server Status, multiple user accounts appear connected from a single client computer.

Note: Only AFP connections count against the AFP user limit in the Mac OS X Server license.

Solution

Whether this occurs depends on how you have the server and user accounts configured.

For example, a user that has a network home directory and is also a member of a group with an automounted share point on the same server makes two connections. The computer connects to the home directory with the user's own user ID (UID), and the group share point using a Guest ID. Each connection appears separately in Server Status (10.2.8 and earlier) or Server Admin (10.3 and later), and both connections will count against the AFP user limit in the Mac OS X Server license.

In Mac OS X Server 10.0.3 to 10.2.8 this is correct behavior.But in Mac OS X Server 10.3, the Apple File Server should only count a single connection against the license for each computer that uses automounts. However, you must update to Mac OS X Server 10.3.3 or later for the correct behavior.
Published Date: Oct 7, 2016

Xserve: How To Rename a Hard Disk Remotely

This document explains how to remotely rename a hard disk on an Xserve with Mac OS X Server 10.2.
This article has been archived and is no longer updated by Apple.
The Xserve can be configured with as many as four Apple Drive Modules. The drives in bays 2, 3 and 4 have similar default names. To rename these disks via a remote connection, use the disktool command during an ssh session. In the steps below, each command you must type is preceded by the number sign (#). Press Return after each command to execute it. Follow these steps:

1. At the remote computer, open Terminal (/Applications/Utilities/).

2. Execute this command:

```
# ssh <server_address>
```

Note: Replace "<server_address>" with the server's actual IP address or DNS name. When prompted to authenticate, use an administrator account of the server. You may or may not receive an RSA key warning.

3. Execute this command to see a list of hard disks:

```
# disktool -l
```

The terminal output will contain entries similar to the following, but your disk numbers may differ. "Unrecognized disk" entries are normal in this output. Example output:

***Disk Appeared ('disk0s10',Mountpoint = '/', fsType = 'hfs', volName = 'Jaguar')
***Disk Appeared ('disk1s2',Mountpoint = '/ServerHD', fsType = 'hfs', volName = 'ServerHD')
***Disk Appeared ('disk2s2',Mountpoint = '/ServerHD 1', fsType = 'hfs', volName = 'ServerHD')

4. Use this command to rename a hard disk with the new name.

```
# disktool -n disk1s2 new_name
```

This command renames the designated hard disk (disk1s2) from the list above to the value "new_name". Replace "new_name" with the actual new name of your choice. If the new name contains a space, enclose it in quotation marks, like this:

```
disktool -n disk1s2 "My Disk"
```

For disks 3 and 4, simply change the target drive in the command (to "disk2s2", for example).

Apple Remote Desktop 1.2: "Old Version" or "Access Denied" When Network Assistant 3 Clients Present on Network

Client status for all computers may be reported incorrectly if Network Assistant 3 clients are present on the network after updating to Apple Remote Desktop 1.2.

This article has been archived and is no longer updated by Apple.

Symptom

Client status is reported incorrectly. Clients report either of these messages:

"Old Version"
"Access Denied"

This happens when using the Remote Desktop 1.2 application with Network Assistant 3 clients present on the network.

Solution

Update to Apple Remote Desktop 1.2.4 or later.

Published Date: Oct 7, 2016

Macintosh Manager 2: Home Directory Is Not Created When Logging In With Administrator Password

When you log in using an administrator account password, the account's home directory is not created.
This article has been archived and is no longer updated by Apple.

Symptom

When you log in using an administrator account password, the account's home directory is not created. This message also appears:

> "Your documents can't be accessed at this time. (Unknown problem #-120.)"

Figure 1 Problem #-120 alert

Note: If offline access is not enabled, the alert message will not include the offline information.

When offline access is allowed, and the user chooses not to work offline, you aren't able to log in using a different account on this computer. When you try to log in using a different account, you see the message in Figure 1.

Solution

Either log in using the account's actual password, or use the createhomedir command on the server to create the home directory for this account before logging in. See technical document 107245, "**Mac OS X Server: How to Use createhomedir Command to Create Home Directories**" for more information on the createhomedir command.

If you can't log in using any other accounts, try either of the following:

- Restart the client computer.
- Log in using an account that already has a home directory, then choose to work offline. This user may immediately log out and back in to log in successfully.

Mac OS X 10.2: Troubleshooting FTP Connection Issues

This document explains what do to if you have issues making an FTP connection using the Finder's Connect to Server command.

This article has been archived and is no longer updated by Apple.

Symptom

- A window named "Volumes" appears, but the actual server volume does not appear.
- There is no alert if you type the wrong server name, volume name, user name, or password.
- The Console utility displays messages like these:

  execstring: /System/Library/Filesystems/ftp.fs/csmount -m /Volumes/doesnotexist.apple.com ftp://doesnotexist.apple.com/ no worky! domain:1, error1
  2003-05-01 14:13:35.390 csmount[869] CFLog (20): Authentication: Enter username and password no worky! domain:1, error1

  or:

  execstring: /System/Library/Filesystems/ftp.fs/csmount -m /Volumes/doesnotexist.apple.com ftp://doesnotexist.apple.com/ no worky! domain:1, error61
  2003-05-01 14:13:35.390 csmount[869] CFLog (20): Authentication: Enter username and password

  Note: In this latter case, if FTP services are unavailable but the computer is reachable, the "connecting to server" message appears indefinitely. The computer is still usable during this time.

Solution

There can be multiple reasons for these symptoms.

- You did not enter the correct user name, password, server name, or volume name.
- The server is unreachable.
- The server is reachable, but FTP services are unavailable.

To test whether the server is reachable at all, enter the server's DNS name or IP address in the ping field of Network Utility (/Applications/Utilities/).

Next, carefully retype the server name or address, user name, password. If that does not work, try using a third-party FTP application instead of the Finder. If that does not work, be sure the server is properly configured.

PowerBook G4 (867 MHz / 1 GHz): Audio Distortion When Playing DVD Movies in Mac OS 9

You may hear noises described as popping and clicking while playing DVD movies in Mac OS 9.
This article has been archived and is no longer updated by Apple.

Symptom

You hear audio distortions, such as popping and clicking, while playing DVDs in Mac OS 9.

Solution

Turn on virtual memory. Follow these steps:

1. Open the Memory control panel
2. Click On.
3. Restart the computer.

Note: Virtual Memory cannot be used on computers that have 1 GB of physical memory (RAM) installed.
Published Date: Oct 7, 2016

Xserve RAID, Apple Fibre Channel PCI Card: Initial Link to a Vixel Fibre Channel Switch Is Uncertain

The Vixel 315 and 335 Fibre Channel Switches do not auto-negotiate speed well with the Apple Fibre Channel PCI Card and the Xserve RAID.
This article has been archived and is no longer updated by Apple.

Symptom

You see:

- an amber light on the affected port of the Apple Fibre Channel PCI Card
- an amber link light on the Vixel 335 port
- an amber link light on the Vixel 315 port
- no fibre channel link light on the controller of the Xserve RAID

Solution

Set the speed for Xserve RAID to 1 Gbit or 2 Gbit, depending on what other devices are connected to the Vixel switch. Follow these steps:

1. Open the RAID Admin Utility.
2. Select the Xserve RAID.
3. Select Settings.
4. Select Fibre Channel.
5. Set Speed to 1 Gbit or 2 Gbit as appropriate for other devices on the Vixel 315 or 335 switch
6. Set topology to Point to Point

Now you should be able to unplug and reconnect the Apple Fibre Channel PCI Card connector in the Vixel switch until it establishes a link.

This document will be updated as more information becomes available.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.
Published Date: Feb 19, 2012

Using RAID Admin with other operating systems

The RAID Admin application included with Xserve RAID can be used with operating systems other than Mac OS, such as Microsoft Windows, Linux, or UNIX.

This article has been archived and is no longer updated by Apple.

You can use RAID Admin on any computer that uses Java 1.3.1 or later. On non-Macintosh computers, note that the admin.app folder is not recognized as an application as it is in Mac OS X or Mac OS X Server. To use the application, follow these steps:

1. Copy the RAID Admin folder from the installation CD to a directory of your choice.
2. Execute the RAID_Admin.jar file, found in the relative path outlined here:

   For RAID Admin 1.2.x and earlier:
   `/RAID Admin/RAID Admin.app/Contents/Resources/Java/RAID_Admin.jar`

   For RAID Admin 1.3 and later:
   `/RAID Admin 1.3.x/RAID_Admin.jar`

Apple recommends that all customers use the latest version of RAID Admin and the accompanying firmware. The latest version of RAID Admin can be downloaded as a Disk Image, a tar file or a zip file from the software downloads section of the Apple Support site.

Also see third-party qualification information for Xserve RAID.

Mac OS X Managed Client: Items in the Dock Do Not Work, or Display a Question Mark (?)

If you choose the wrong location for a managed client Dock item, the item may appear as a question mark (?) in the Dock, or the item may not work.

This article has been archived and is no longer updated by Apple.

Symptom

An item in the Dock does not work, or it appears as a question mark (?), instead of as its normal icon.

Solution

When adding items for the Dock, the full pathname of the item is written. If the administration computer at which you are using Workgroup Manager has that item in a different path than at the client computers, the Dock item may not work. Administration computers should have software or other target files installed in the same location as on managed client computers.

Mac OS X Server 10.2: Cannot Start the NetBoot Server From Server Settings

You may encounter a situation in which Server Settings reports DHCP/NetBoot is not running, and it will not start. This document explains what to do.
This article has been archived and is no longer updated by Apple.

Symptom

- Server Settings reports DHCP/NetBoot is not running, and it will not start.
- Server Status reports DHCP/NetBoot is running.

Solution

When the DHCP/NetBoot service will not start in Server Settings, yet Server Status reports the service is running, check the contents of /etc/xinetd.d/bootps to verify it looks like this:

```
service bootps
{
        disable = no
        socket_type     = dgram
        wait            = yes
        user            = root
        server          = /usr/libexec/bootpd
        groups          = yes
        flags           = REUSE
}
```

If the file is empty (or if the file size is 0), then edit the existing bootps file to look like the example above. Quit and reopen Server Settings, and it should now report the correct status.

Note: You may edit the bootps file in a text editor of your choice. If you are not familiar with editing such files, one method is described in technical document 106619, "**Mac OS X Server: How to Locate and Edit Configuration Files**".
Published Date: Oct 7, 2016

Mac OS X Server 10.2: How to Add Apple Remote Desktop to a Network Install Image

This document explains how to add Apple Remote Desktop administration or client software to a Network Install image.
This article has been archived and is no longer updated by Apple.
Follow the steps below to add Remote Desktop administration or client software to a Network Install image. These steps are written for a version 10.2 installation. If installing version 10.1 then be sure to use the 10.1 pref package in place of the 10.2 pref package in step 7.

1. On the NetBoot Server, log in with the root account. If you need help, see technical document 106290, "**Mac OS X: About the root User and How to Enable It**".

2. In Server Settings, stop the NetBoot/DHCP Service (be sure no NetBoot clients are online).

3. Navigate in the Finder to your Network Install image:

```
/Library/NetBoot/NetBootSPx/<image name>.nbi/<image name>.dmg
```

4. Select the image, and choose File > Get Info.

5. Unlock the image, and close the Info window.

6. Double-click the disk image file to mount it.

7. Copy the following files to the Packages folder in the mounted image (/System/Installation/Packages):

```
RDClient.pkg
RDDocs.pkg
RDPref10_2.pkg
RDAdmin.pkg (optional administration software)
```

8. Control-click the OSInstall.mpkg file in the mounted image (/System/Installation/Packages), and choose Show Package Contents from the shortcut menu that appears.

9. Open the Contents folder (inside OSInstall.mpkg), then open the file Info.plist that you find there, using a text editing application of your choice.

10. Copy and paste one of the existing entries, which take this form:

```
<dict>
    <key>ExampleKeyOne</key>
    <string>example1.pkg</string>
    <key>ExampleKeyTwo</key>
    <string>example_value</string>
</dict>
```

11. Change the value of the IFPkgFlagPackageLocation key to the name of the first package you put in the Packages folder in step 7.

Note: The value is the text between the "string" tags.

12. Change the value of the IFPkgFlagPackageSelection key to "required" or "selected". For example:

```
<dict>
    <key>IFPkgFlagPackageLocation</key>
    <string>RDClient.pkg</string>
    <key>IFPkgFlagPackageSelection</key>
    <string>required</string>
</dict>
```

13. Repeat steps 10 through 12 for each additional package copied in step 7.

14. (Optional) Open the file NBImageInfo.plist (in /Library/NetBoot/NetBootSPx/<image name>.nbi/). Change the value of the Name key to what you would like to appear when selecting a Startup Disk. For example:

```
    <key>Name</key>
```

```
        <string>10.2 + ARD 1.2</string>
```

15. Put away the image.

16. In Server Settings, enable the image (if the image does not appear under the Images tab, quit and reopen Server Settings).

17. Start the NetBoot/DHCP service.

See also page 548 of the 10.2.3 Server Admin Guide for more information on adding packages to a Network Install image, or to technical document 107356, "**Mac OS X Server: How to Add Packages to an OS Install Image**".

Important software license information

In accordance with the Network Install and Mac OS X Server software license agreements, you may use the software in this manner as long as you ensure that each end user of the image files is aware of and complies with the terms of the software license(s) that governs the use of the software contained within the image files. The Network Install and Mac OS X Server software may be used to install and reproduce materials so long as your use is limited to reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce.

Mac OS X Server 10.2: Where to Find the Serial Number

The Mac OS X Server serial number may be found on either the CD sleeve or on a separate sheet in the documentation packet. It is not always on the CD sleeve, as suggested by the Setup Assistant.

This article has been archived and is no longer updated by Apple.

The Mac OS X Server Setup Assistant indicates that the Software Serial Number can be found on the paper sleeve that contained the installation disc. It says:

> "The Software Serial Number is located on the CD envelope"

This is not always the case. The serial number may also be found ona full size sheet of paper that is included in the documentation packet.

Open Firmware: Password Not Recognized When Using Keyboard Layout Other Than U.S.

If you created a password in the Open Firmware Password application while using a keyboard layout other than U.S., your password may not be recognized during the startup process (when you try to access Startup Manager, for example).

This article has been archived and is no longer updated by Apple.

Symptom

Your Open Firmware password is not recognized during startup.

Solution

This issue occurs because keyboard layout mapping is not available early in the startup process. This means your keyboard input is treated as if it were a U.S. keyboard.

Use one of these two workarounds:

1. At the password prompt during startup, type your password as if you had a U.S. (QWERTY) keyboard, **or**

2. Change the keyboard layout to U.S. prior to creating your password in the Open Firmware Password application, but type your password as if you were using a localized keyboard layout.

Either of these workarounds will have the effect of "reverse mapping" your password, so that it is recognized.

Published Date: Oct 7, 2016

Mac OS X: Sendmail Does Not Start

Certain privilege settings that make Mac OS X easier to use can cause the sendmail process not to run properly.
This article has been archived and is no longer updated by Apple.

Symptom

The sendmail process cannot start. The system.log file contains an entry similar to this:

```
sendmail[1195]: NOQUEUE: SYSERR(root): /etc/mail/sendmail.cf: line 93: fileclass: cannot open
'/etc/mail/local-host-names': Group writable directory
```

Note: The Mail application does not require sendmail, which is turned off by default. If you don't know what sendmail is, you probably don't need it and should not be affected by this issue.

Solution

Sendmail requires alternate permissions for the root directory (/).

1. In Terminal, execute this command:

```
sudo chmod g-w /
```

2. Restart the computer.

Note: You may have to repeat these steps after installing software or repairing privileges on the startup volume.
Published Date: Oct 7, 2016

Mac OS X Server: How to Avoid Sending Clear Passwords in a Kerberos Environment With LDAPv3

To avoid sending clear text passwords over the network, turn off LDAP bind authentication when using Kerberos login authentication.
This article has been archived and is no longer updated by Apple.
When using a Kerberos login and integration with an LDAPv3 server, a account password may be sent in clear text format. When the authentication authority attribute is not set, Login Window tries to authenticate the account to the configured LDAP server. After trying to authenticate the user with an encrypted password, Login Window falls back to trying a simple bind on the server. This simple bind transmits the account password in clear text.

To prevent this, map the AuthenticationAuthority attribute to an existing non-null attribute in your LDAP server. Which attribute you map it to is not important as long as that attribute is not null and exists in the directory. Do not use a static map entry. This may keep the Login Window from completing the login process and you may need to restart the computer.

To update your configuration, follow these steps at each client computer:

1. Open Directory Access (/Applications/Utilities/).
2. Click the lock button to authenticate.
3. Select LDAPv3.
4. Click the Configure button.
5. Click the Search and Mappings tab.
6. Select the Users record entry.
7. Click the triangle to expose the configured attributes.
8. Click the Add button.
9. Select the Attributes Types.
10. Scroll down and select AuthenticationAuthority from the list. See Figure 1.

Figure 1

11. Click OK.
12. With AuthenticationAuthority selected, click the Add button on the "Map to in list" window (right side of screen).
13. Type in an existing Attribute to map the AuthenticationAuthority to. In Figure 2, it is mapped to loginshell.

Figure 2

14. Click OK to save the configuration.
15. Click OK again to close configuration entries screen.
16. Quit Directory Access.
17. The changes will propagate in approximately two to three minutes, but you can restart the computer to immediately test the new configuration

System Requirements

- Mac OS X 10.2 and later
- Mac OS X 10.2 Server and later

Note: When using LDAP, you should use it with SSL to reduce risk of other data security issues.
Published Date: Oct 7, 2016

Mac OS X 10.2: Web Sharing Uses Default Configuration After Software Update

Mac OS X 10.2.4 and later include an updated "httpd.conf" file as part of a larger Rendezvous update.
This article has been archived and is no longer updated by Apple.

Symptom

Personal Web Sharing operates in its default state after a software update.

Note: You should not encounter this issue if you did not use the 10.2.4 Update specifically. Example: If you updated from 10.2.3 to 10.2.6 by using the Mac OS X 10.2.6 "combo" update, then you should not have this issue.

Solution

The previous http.conf file that you customized is saved by the Installer and renamed to "httpd.conf.applesaved". By renaming the files, you may put the customized file back into service.

1. Turn off Personal Web Sharing.
2. Open Terminal (/Applications/Utilities/).
3. Type: `sudo mv /etc/httpd/httpd.conf /etc/httpd/httpd.conf.rendezvous`
4. Press Return.
5. Type the password for your administrator account when prompted, and press Return.
6. Type: `sudo mv /etc/httpd/httpd.conf.applesaved /etc/httpd/httpd.conf`
7. Turn on Personal Web Sharing.

Additional information

When using the previous file, Rendezvous will not have features that require the updated file. The steps above saved the updated file as "httpd.conf.rendezvous". This is so that you may customize the new file and put it back into service at a later date.

Mac OS X 10.2.5 and later updates have a different installation method for the new httpd.conf file. The Installer checks to see if you have modified the existing httpd.conf file. If you have not, then it automatically replaces it with the new version. If you have modified it, then your modified file is left in place, and the new file is written as /etc/httpd/httpd.conf.default. At your leisure, you should add your modifications to the new file and retire the old one.
Published Date: Oct 7, 2016

Mac OS X 10.2 cannot connect to file sharing over Ethernet when AirPort is the primary interface

You may not be able to make an Apple Filing Protocol (AFP) connection, such as Personal File Sharing, over wired Ethernet if AirPort is your preferred network port.
This article has been archived and is no longer updated by Apple.
This occurs when you're using Mac OS X 10.2 to 10.2.8 and these three conditions are met:

- Built-in Ethernet is configured via DHCP.
- AirPort is the preferred configuration (listed first) in the Network Port Configurations list.
- You get a local-link (169.254.x.x) IP address.

Use one of these workarounds in Network preferences:

Manually enter a valid IP configuration for the Built-in Ethernet port.

Or

Drag the Built-in Ethernet port to the top of the Network Port Configurations list.
Published Date: Oct 7, 2016

Mac OS X: How to Set Up NetInfo Binding

This document explains how to connect, or bind, a Mac OS X computer to a NetInfo server. Users' home directories may be provided via NetInfo, for example.
This article has been archived and is no longer updated by Apple.
You can configure NetInfo binding by using the Directory Access application (or Directory Setup prior to v10.2). Follow these steps:

1. Open Directory Access (/Applications/Utilities/).
2. If necessary, click the Lock button to authenticate.
3. Click the Services tab.
4. Select NetInfo in the list of services, then click Configure.
5. Select the binding protocols that you want the computer to use (broadcast, DHCP, or specific server). If you use the specific server option, enter the IP address of the parent server in the Server Address field, and the parent domain's NetInfo tag in the Server Tag field.
6. Click OK, then click Apply.
7. Restart the computer.

If the client computer is set to log in automatically with a specific account, then log out to log back in as a NetInfo User. You may need to set the client login option for name and password entry.

Additional information

A Mac OS X computer can bind to a shared NetInfo domain by using any combination of three protocols: static, broadcast, or DHCP. If you configure a computer to use multiple binding protocols and a parent is not located with one protocol, another one is used. The protocols are used in this order: static, DHCP, broadcast.

- With static binding, you specify the address and NetInfo tag of the shared NetInfo domain. This is most commonly used when the shared domain's computer is not on the same IP subnet as the computer that needs to access it.
- With DHCP binding, a DHCP server automatically supplies the address and NetInfo tag of the shared NetInfo domain. To use DHCP binding, the DHCP server must be configured to supply a NetInfo parent's address and tag.
- With broadcast binding, the computer locates a shared NetInfo domain by sending out an IP broadcast request. The computer hosting the shared domain responds with its address and tag. For broadcast binding:
  - Both computers must be on the same IP subnet or on a network that is configured for IP broadcast forwarding.
  - The parent domain must have the NetInfo tag "network".
  - The parent domain must have a machine record for each of its child domains.

Note: This information can be found beginning on page 106 of the Mac OS X Server Administrator's Guide. Please see the guide for additional related information. You may download it from Knowledge Base document 120174, "**Mac OS X Server Admin Guide for Mac OS X 10.2.3: Manual**".
Published Date: Feb 17, 2012

Bluetooth: How to Set Up a Microsoft Bluetooth Mouse

This document describes how to set up a Microsoft Bluetooth Mouse with Mac OS X 10.2.6 or later.

This article has been archived and is no longer updated by Apple.

Important: Before starting, be sure you have updated to Mac OS X 10.2.6 or later. If your Macintosh does not have built-in Bluetooth hardware, connect a USB Bluetooth adapter to one of the USB ports on the computer. If your computer came with a wired mouse, keep it connected until setup of the new Bluetooth mouse is complete. After setup is complete, you can disconnect the wired mouse.

Follow these steps:

1. Open the Bluetooth Setup Assistant (/Applications/Utilities/).
2. Click Continue.
3. At the Select Device Type panel, select Mouse. Do not click Continue yet.
4. Press the Connect/Channel button located on the underside of the Bluetooth mouse.

Note: This button is located next to the battery compartment on recent models.

5. Click Continue. Microsoft Mouse should appear in the device list of the Search pane.

Note: If your mouse is not listed in the Search pane, try pressing the button on the underside of the mouse again, then click the Go Back button in the Setup Assistant, and click Continue to reinitiate the search. If the mouse is still not listed, be sure that you have installed working batteries in the mouse. The light on the underside of the mouse should light when you click a mouse button. See the documentation that came with the mouse for more information.

6. Select the mouse in the Setup Assistant listing, then click Continue. The assistant tries to pair with the mouse.
7. Once the assistant indicates that the computer and mouse have successfully paired, click Continue.
8. The setup should be complete. Click the Quit button to exit setup.

You should now be able to use the Bluetooth mouse.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Bluetooth: How to Set Up a Microsoft Bluetooth Keyboard

This document describes how to set up a Microsoft Bluetooth Keyboard with Mac OS X 10.2.6 or later.

This article has been archived and is no longer updated by Apple.

Important: Before starting, be sure that you have updated to Mac OS X 10.2.6 or later. If your Macintosh does not have built-in Bluetooth hardware, connect a USB Bluetooth adapter to one of the USB ports on the computer. If your computer came with a wired USB keyboard, keep it connected until setup of the new Bluetooth keyboard is complete. After setup is complete, you can disconnect the wired keyboard.

Follow these steps:

1. Open the Bluetooth Setup Assistant (/Applications/Utilities/).
2. Click Continue.
3. At the Select Device Type panel, select Keyboard. Do not click Continue yet.
4. Press the Connect/Channel button located on the underside of the keyboard.

Note: On recent models this button is located near one of the keyboard feet.

5. Click Continue in the Setup Assistant to go to the Search pane. Microsoft Keyboard should appear in the device list of the Search pane.

Note: If your Keyboard is not listed in the search pane, try pressing the button on the underside of the keyboard again. Then click the Go Back button in the Setup Assistant to back up one pane, and click Continue to re-initiate the search. If the Keyboard is still not listed, make sure that you have installed working batteries in your keyboard. See the documentation that came with your keyboard for more information.

6. Select the keyboard from the listing, and click Continue to advance to the next setup screen.
7. You will be prompted to enter a passkey. Using the wired keyboard, type a number between one and nine digits into the passkey field of the assistant, then click Continue.
8. You will then be prompted to enter the same passkey again, this time using the Bluetooth keyboard. Type it, then press enter.
9. The setup should be complete. Select the Quit Button in the Setup Assistant to exit setup.

You should now be able to use the Bluetooth keyboard.

Tip: If you do not have a wired keyboard connected but do have a working mouse, you can use the KeyCaps application to input the passkey in step 7. Open KeyCaps and click the keys represented in the KeyCaps application with your mouse. Select the text in the KeyCaps field, then copy and paste it into the passkey field of the Bluetooth Setup Assistant.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Mac OS X Server 10.2: Server Status Does Not Display LDAP Log

By default slapd.log does not exist, and syslogd does not redirect LDAP logging data to /var/log/slapd.log.
This article has been archived and is no longer updated by Apple.

Symptom

There is no data available when you try to locate the LDAP log in Server Status.

Solution

Important: This procedure requires restarting the server, so it is best performed during off-peak hours. Some LDAP clients, including Mac OS X and Mac OS X Server computers, may not reconnect until you restart them.

1. Open Terminal (/Applications/Utilities/).
2. Type: `sudo touch /var/log/slapd.log`
3. Press Return.
4. Type your administrator account password when prompted, and press Return.
5. Type: `sudo pico /etc/syslog.conf`
6. Press Return.
7. Add the following line to the end of the syslog.conf file, creating the space with the Tab key:

```
LOCAL4.*    /var/log/slapd.log
```

Note: In the line above, four tabs are used. The exact number of tabs does not matter, so long as they are tabs and not spaces. This is an aesthetic choice. You may use only one tab, or use the number of tabs required to align the text with adjacent lines.

8. Press Control-X, then press Y to confirm.
9. Press Return. This will save the data to the syslog.conf file.
10. Restart the server.

When you log into Server Status, you should now see the LDAP log information.

Mac OS X Server 10.2.8 or Earlier: How to Prevent One File From Being Simultaneously Modified by Two Users

Two users connected to the server via different protocols may be able to modify the same file simultaneously.
This article has been archived and is no longer updated by Apple.

Symptom

An Apple File Services (AFP) client is able to obtain read-write access to a file that is already being modified by a Windows File Service (SMB) or NFS client, or vice versa.

Note: It would normally be expected that secondary users of a file get read-only access.

Solution

File locking systems vary between Apple Filing Protocol, SMB, and NFS. Use the following strategies to avoid the issue.

Using AFP with SMB

When sharing simultaneously via AFP and SMB, take these actions:

1. Be sure that client and server are both updated to version 10.2.3 or later.
2. When configuring Windows File Settings for a share point in Workgroup Manager, be sure the checkbox for "Enable strict locking" is selected.

Note: If you cannot immediately update to 10.2.3 or later, use only one protocol per share point.

Using NFS

To prevent this issue when using NFS, separate your share points by protocol. Use one share point for NFS clients, and another share point for AFP and SMB clients.

Note: All versions of Mac OS X can connect to a server over NFS. Mac OS X 10.1 or later can connect to file servers over SMB.
Published Date: Feb 17, 2012

Mac OS X Server 10.2: Installing From Command Line Results in Working But Incorrect System

If you install Mac OS X Server from the command line, the result may be a working system that has incorrect permissions. This occurs if the installation CD does not have permissions enabled. This document explains how to resolve the issue.
This article has been archived and is no longer updated by Apple.

Symptom

After you start up the installed system, the Disk Copy application will not open. If you look at the system.log in Console, you see this message:

> Mac OS X Version 10.2.4 (Build 6I34)
> load_hdi: this tool was improperly installed.
> (The setuid bit was cleared accidentally.)
> You will need to either re-install the system software and/or execute the following as root:
> chown root:wheel /usr/libexec/load_hdi
> chmod 4555 /usr/libexec/load_hdi

Solution

To prevent this issue from occurring, deselect the "Ignore ownership on this volume" checkbox for the installation CD prior to installation.

If you have not yet installed, follow these steps:

1. Insert Disc 1 of the Mac OS X Server CD set that you plan to install from.
2. Select the disc in the Finder.
3. Choose File > Get Info.
4. Click the Ownership & Permissions disclosure triangle.
5. Deselect the checkbox that says "Ignore ownership on this volume".
6. Eject the CD
7. Reinsert the CD.

Now you will get the correct results when installing from the command line.

Note: The steps above update the Volume Information Database, a permanent file of information about each volume that has been used by the Mac OS X system.

If you have already installed and need to correct permissions, follow these steps:

1. Open Disk Utility.
2. Click the First Aid tab.
3. Select the target volume.
4. Click the Repair Disk Permissions button.

Published Date: Feb 17, 2012

Mac OS X: May Not Share AirPort Internet Connection

Internet Sharing may not allow you to share an AirPort Internet connection if AirPort is not set to the highest port priority.
This article has been archived and is no longer updated by Apple.

Symptom

The Internet Sharing preference pane does not allow you to share your AirPort Internet connection to wired Ethernet clients.

Solution

At the sharing computer, drag AirPort to the top of the port configuration list:

1. Choose Apple menu > System Preferences.
2. Choose View > Network.
3. Choose Network Port Configurations from the Show pop-up menu.
4. Drag AirPort to the top of the port configuration list.
5. Click Apply Now.

In the Internet Sharing preference pane, you should now see this message:

"You are connected to the Internet over Airport. This connection will be shared with computers connected to Built-in Ethernet. "

Published Date: Oct 7, 2016

Mac OS X Managed Client: "You are already logged on to another computer" Message

If a client computer stops responding ("freezes") or has a power interruption while connected to the user's home directory, the server may continue to register the volume as mounted. This prevents the user from logging in at a second computer.
This article has been archived and is no longer updated by Apple.

Symptom

A user who tries to log in at a second computer after the first stops responding sees this message:

"You cannot continue because you are already logged on to another computer. You may only log into one computer at a time. Contact your system administrator for help."

Solution

Use one of these methods:

- Have the user log back into the server on the same client computer that stopped responding. You may need to force the client computer to restart.
- Use the Server Status application to manually disconnect the user's AFP connection. If the user has multiple sessions open from the same client computer, disconnect them all.

Note: If this issue affects only 10.4 clients, it may be due to access to the invisible folder ~/.Spotlight-V100. The issue would happen if the owner of this folder were set to read-only permissions, for example. The owner of this folder must have full read-write-execute permissions ("rwx" or "7"). Files inside ~/.Spotlight-V100/ must be set to read-write ("rw" or "6"), with exception of mds-lock-dir and slave-work-dir, which should be set to rwx.

Published Date: Feb 17, 2012

AirPort: "Assistant can only be used to Configure an Apple AirPort Base Station" Message

The AirPort Setup Assistant can only be used with Apple base stations that have DHCP turned on.
This article has been archived and is no longer updated by Apple.

Symptom

When you open the AirPort Setup Assistant, this message appears:

> "The AirPort Setup Assistant is unable to configure the selected base station. The AirPort Setup Assistant can only be used to setup an Apple AirPort Base Station. If you are trying to reconfigure a base station that has DHCP turned off, use the AirPort Admin Utility."

Solution

These are the two possible causes. Either the wireless access point you are trying to set up was not manufactured by Apple, or DHCP is turned off on the Apple base station.

If you have a third-party wireless access point, follow the manufacturer's instructions for setting it up. The AirPort Setup Assistant and AirPort Admin Utility are not used for third-party base stations.

If you have an AirPort base station, follow these steps:

1. At the client computer, choose Apple menu > System Preferences.
2. Choose View > Network.
3. Choose AirPort from the Show pop-up menu.
4. Be sure that TCP/IP for AirPort is set to configure "Using DHCP".

Note: If you had to make any changes, click Apply Now. If the computer is connected to both AirPort and wired Ethernet, be sure to disconnect the wired Ethernet before continuing.

5. Unplug both the base station's power cord and its Internet connection (Ethernet cable or phone wire).
6. Restart the computer.
7. Open a Web browser on the computer.

Note: The browser's connection attempt is intended to fail. It has the effect of forcing the computer to self-assign an IP address in the correct range.

8. Plug in the base station's power cord, and wait for it to start.
9. If the AirPort network is not already selected, join the network by selecting it from the AirPort menu bar item.
10. Open the AirPort Admin Utility.

You may now reconfigure the base station using AirPort Admin Utility.

Note: One possible way to accidentally turn off DHCP is by using the wrong Ethernet port on the base station. Be sure to connect to the base station to the Internet via the WAN port, depicted in Figure 1. This does not apply to the original AirPort Base Station (Graphite), which has only one Ethernet port.

Figure 1 Ports of the AirPort Base Station (Dual Ethernet)

Safari does not resolve certain aliases

If you like to use aliases, you might notice that Safari does not resolve them under certain circumstances.
This article has been archived and is no longer updated by Apple.
You may notice these symptoms:

1. Your Microsoft Internet Explorer bookmarks are not automatically imported by Safari if you have placed an alias in the path to your Explorer bookmarks.
2. If you drag an alias of a compatible file into a Safari window, the file does not open. The file opens if you drag the original file into the window.
3. If you replace the folder ~/Library/Safari with an alias, the alias is not resolved.

For the first symptom, see **Internet Explorer bookmarks not imported when alias is used**.

For the second symptom, the solution is to drag the original file into the window. This document will be updated if that behavior changes.

The third symptom is by design. Allowing Safari to resolve this particular alias could affect the time it takes to open the application.

Advanced technique

If using an alias is very important to you, you may work around the issue by using a symbolic link instead of an alias. Because this is an advanced technique that is not recommended in all circumstances, Apple does not provide technical support for it.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Published Date: Oct 7, 2016

Safari 1.0: Internet Explorer bookmarks not imported when alias is used

If you are using an alias in the place of your Internet Explorer bookmarks, or if you place an alias in the path to them, they are not automatically imported by Safari.
This article has been archived and is no longer updated by Apple.
When your Internet Explorer bookmarks file, "favorites.html", is in the default location, Safari will import it the first time you open Safari. However, if you have placed an alias in the path, the bookmarks are not imported.

If you have already started building a new bookmarks collection in Safari, the best solution may be to copy the bookmarks from Internet Explorer one at a time. If you have not yet built a collection of bookmarks in Safari, follow the steps below. These steps will remove Safari bookmarks and preferences that you have set, simulating a first use of Safari.

For Safari version 1.1 or later, see **Importing bookmarks from other browsers**.

For Safari 1.0 you may use that document or these alternate steps. These steps do not work for Safari 1.1 or later.

1. Quit Safari if it is open.
2. Click the Finder icon in the Dock.
3. From the **Go** menu, choose **Home**.
4. Open your Library folder.
5. Locate the Safari folder there, and drag it to the Trash.
6. Place the Internet Explorer bookmarks (favorites.html) back in their original location (removing the alias from the path).
7. Open Safari.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Published Date: Oct 7, 2016

Safari: You can only drag one bookmark at a time from Internet Explorer

This article has been archived and is no longer updated by Apple.
If you try to drag a selected group of bookmarks from Internet Explorer to Safari, only one will be copied. Most often, only the first or last bookmark of the selection is copied.

You should drag one bookmark at a time from Explorer to Safari. This is the expected behavior.

As a temporary workaround, drag the file ~/Library/Preferences/Explorer/Favorites.html into your Safari bookmarks window. This adds a bookmark to your Explorer favorites file, which you can open as a list of links in Safari. When doing this, beware that the file is only bookmarked and not imported. You must keep the original Favorites.html file.

Additional information

Because Safari automatically imports Explorer bookmarks the first time you use Safari, this issue is normally only relevant if the import could not be completed. For related information, see technical document 107599, "**Safari: Internet Explorer Bookmarks Not Imported When Alias Is Used**".

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Safari only prints the visible portion of the page

Safari may only print the visible portion of a webpage, cutting off the portion you must scroll to see.
This article has been archived and is no longer updated by Apple.
This occurs when the page uses frames.

For best printing results, click on the block of text that you are trying to print immediately before printing. Many websites have these major elements, each of which could be a frame:

- A site identification area, or banner, across the top of the page.
- A table of contents, or navigation links, in a column on the right or left side.
- A central text window in the middle, which shows the main content.

Update to Mac OS X 10.3.6 or later to resolve the issue.

As an immediate workaround, prior to updating, you can click the text in the primary window immediately before printing. This tells Safari that you are focused on the main content frame.

Do not drag install Safari

You should not drag a copy of Safari 1.0 or later to install it. If you do, Safari may not work, or may give unexpected results.

This article has been archived and is no longer updated by Apple.

Beta versions of Safari were compatible with "drag install," the practice of installing software by simply copying an application to the desired location. With Safari 1.0 and later, this is no longer a viable method of installation. Instead, use the Safari Installer, which includes necessary support files.

Published Date: Oct 7, 2016

Safari does not work after installing version 1.0

If you have installed multiple copies of Safari, the Installer will upgrade the first copy it finds. This may not be the copy that is in use. Subsequently, Safari may not work at all.
This article has been archived and is no longer updated by Apple.
To resolve the issue, follow these steps:

1. Click the Finder icon in the Dock.
2. From the **File** menu, choose **Find**.
3. Type "Safari.app" in the File Name Contains field.
4. Click Search.

   Note: The resulting files will be named simply "Safari", since the ".app" suffix is hidden by default.

5. One at a time, double-click the copies of Safari that are found until you find the one that works.
6. Using the copy that works, download Safari again from its website (http://www.apple.com/safari/).
7. Drag all copies of Safari.app to the Trash.
8. Reinstall Safari using the Installer you just downloaded.

Published Date: Oct 7, 2016

Safari: Images dragged or copied from Safari appear upside down

Images dragged or copied from Safari 1.1 or earlier may appear upside down when the screen resolution is set to thousands of colors (16-bit screen depth).
This article has been archived and is no longer updated by Apple.
Images dragged or copied from Safari windows appear upside down.

For best results, change the display to millions of colors. (The issue may still occur infrequently in millions of colors.)

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Displays**.
3. Locate the Colors pop-up menu item on the upper right.
4. Choose Millions from the pop-up menu.
5. Quit System Preferences.
6. Quit and reopen Safari.

Safari doesn‘t sign out of MSN, even though you click Sign Out

The MSN.com webpage refreshes when you click Sign Out, but you may actually remain signed in.
This article has been archived and is no longer updated by Apple.
You can tell because the "Sign Out" button does not switch to "Sign In" after you try to sign out.

This is caused by using the default cookie setting, which is to accept cookies only from sites you navigate to. Changing the cookies preference to Always allows MSN to log out properly. To change the default cookie setting:

1. From the **Safari** menu, choose **Preferences**.
2. Click the Security icon.
3. Locate the Accept Cookies area in the panel.
4. Select the Always radio button for Accept Cookies.
5. Close the preference panel.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Safari: Using with Live Connect

Safari can't display Live Connect pages when using older versions of Java software, in which case you might see some blank pages.
This article has been archived and is no longer updated by Apple.
But you can use Live Connect websites after installing these software updates:

- Mac OS X 10.3.1 or later
- Java 1.4.2
- Safari 1.2 or later

You can get these updates in Software Update preferences, or from Apple Downloads.

Note: Live Connect is a technology used on some websites for Java functions. With the software listed above, Live Connect is able to use JavaScript-to-Java applet communication. It does not facilitate JavaScript-to-plug-in functions, so some Live Connect features may be unavailable.

Workgroup Manager: "Error -14487"

You may see an alert message that includes "error -14487" when using Workgroup Manager.

This article has been archived and is no longer updated by Apple.

Symptom

You see an alert message that contains "error -14487".

Solution

This message means that Password Server is unavailable. There are two likely causes:

- Directory Services cannot open a connection to Password Server, or
- The administrator has a password set to "basic". An Admin user account with a basic password cannot set up users on the Password Server. In order to administer Password Server accounts, you must log into Workgroup Manager with a Password Server-based Admin user account.

To resolve the issue:

1. Verify the Password Server is running.
2. Log into Workgroup Manager as an administrator who has a Password Server password.

Published Date: Feb 17, 2012

Mac OS X Server 10.2: How to Select a Startup Disk via SSH

You may need to change the startup volume via SSH in certain scenarios, such as when remotely installing Mac OS X Server. This document explains how to do so.
This article has been archived and is no longer updated by Apple.
You can use this method any time you prefer to use SSH, but a particularly useful example is when the computer does not start up from the desired volume after installation from CD, or when you wish to select a different volume immediately after remote installation (before restarting the target computer).

If the target computer is currently started up from CD and you don't already know its IP address, see technical document 51846, "**Mac OS X Server for Xserve: How to Find a Server on the Network**".

The following procedure uses the "bless" command to choose a startup disk for a remote Mac OS X Server.

1. Open Terminal (/Applications/Utilities/).
2. Type: `ssh root@<address>`

Note: Replace "<address>" with the actual IP address or DNS name of the target computer. An actual example would look like:

```
ssh root@mycomputer.example.com
```

3. Press Return.
4. Enter the root password for the target computer when prompted, then press Return.

Note: If the target computer is started up from CD, the root password is the first eight digits of the target computer's serial number. If that password does not work when started up from CD, the computer's logic board may have been replaced. You cannot use this method when started up from CD if the logic board has been replaced.

5. Once connected to the server via ssh, type:

```
bless -folder "/Volumes/disk_name/System/Library/CoreServices" -setOF
```

Note: Replace "disk_name" with the actual name of the disk that contains the desired startup volume.

6. Press Return.
7. Type: reboot
8. Press Return.

Your ssh connection will be closed, and the server will restart to the volume selected in step 5.

Server Monitor: How Server Monitor Sends Email Notifications

This document explains the methods Server Monitor uses to send email notifications. This document applies only to Mac OS X Server versions 10.1.5 to 10.2.8.

This article has been archived and is no longer updated by Apple.

Server Monitor consists of two separate pieces of software. The "hwmond" process is the hardware monitoring on the server itself. The Server Monitor application remotely monitors the server via communication with hwmond.

There are two ways to have notifications sent. The server can be configured to send notifications itself. In this case, hwmond just creates a text file and pipes it through sendmail. In order for this to work correctly, make sure the permissions on the root directory (/) don't allow group or other write permissions. The permissions for / are set to 1755 when Mac OS X Server is installed. Some software updates modify this, enabling group write permission, which causes sendmail to exit without sending any mail.

The Server Monitor application can also be configured to send email notifications. Note that it is not possible to have both hwmond and Server Monitor send notifications. Choose one or the other. Server Monitor uses the Message.framework to send the notification. The Message.framework looks in two places for a way to send email. The first is that it looks for an SMTP server configured in the Email tab of Internet preferences. The other way is to use an email account configured in Mail. If an outgoing SMTP server is configured in Internet preferences, there is no need to configure the Mail application.

Mac OS X Server 10.2: How to Authenticate Using an Administrator‘s Password

This document explains how to allow or disallow a normal user from authenticating with an administrator's password.
This article has been archived and is no longer updated by Apple.
An option for Apple File Service (AFP) allows a normal user to authenticate using an administrator's password. This can be useful when troubleshooting user-specific issues, such as permissions.

This feature can only be configured manually, by editing the AFP server's local NetInfo database. Use the steps below to enable or disable this feature:

1. Log into the server with an administrator account.
2. Open NetInfo Manager (/Applications/Utilities/).
3. In the NetInfo Manager navigation window, select the local directory, and go here:

   /config/AppleFileServer

4. Look for this property:

   attempt_admin_auth

5. To enable the feature, the value of this property must be 1. To disable this feature, the value of this property must be 0. Double-click the value to change it.
6. Save the changes in NetInfo Manager.
7. Using Server Settings, stop and restart Apple File Service.

Mac OS X Server 10.2: NetBoot Clients Cannot Use Some Disk Utility Features

While a computer is a NetBoot client, some of the features in Disk Utility do not work.
This article has been archived and is no longer updated by Apple.

Symptom

An alert with this message appears in Disk Utility:

> "Unmount Failed The disk 'Macintosh HD' failed to unmount because it is in use. The operation has been canceled."

Solution

This is expected behavior for NetBoot clients. You may use all features of Disk Utility while started up from any of the following:

- A Network Install image
- An installation CD
- Another volume with Mac OS X installed on it

Published Date: Feb 17, 2012

Mac OS X Server: Maximum UFS partition size is less than 1 TB

This article has been archived and is no longer updated by Apple.

The maximum volume size for a UFS partition in Mac OS X Server 10.0.3 or later is just less than 1 TB.

Symptom

You cannot format a UFS volume as 1 TB or larger.

Solution

Use smaller volumes. The maximum volume size for a UFS partition is slightly less than 1 TB. Precisely, it is 2147475488 blocks.

Published Date: Oct 7, 2016

Mac OS X Server 10.2: Mac OS 9 Users Can‘t Delete Files or Folders

Mac OS 9 Apple File Service clients may not be able to delete items from a server volume with group write permission.
This article has been archived and is no longer updated by Apple.

Symptom

There are two different symptoms:

- When dragging a file to the Trash, an alert message states that you don't have enough privileges or that the item has to be deleted immediately.
- You drag a folder to the Trash, but you can't empty it. The folder icon has a belt on it when viewed in the Trash.

Solution

To resolve the first symptom, Install Security Update 2003-06-09.

To resolve the second symptom, turn off the "use inherited permissions" option for the shared folder, or follow these steps:

1. Open the folder.
2. Drag all the contents to the Trash.
3. Drag the empty folder to the Trash.
4. Repeat for any nested folders.

Published Date: Feb 17, 2012

Mac OS X Server 10.2: Administrator Sees Volumes But Not Home Directory When Connecting via AFP

When an administrator logs into Apple File Service (AFP), he sees all mounted server volumes and no home directory. Normal users see only shared volumes and their home directories. You may change the default administrator behavior if desired.
This article has been archived and is no longer updated by Apple.

Symptom

An administrator sees all mounted server volumes but no home directory when connecting via AFP.

The administrator may navigate to his home directory, but when he does, he will see only the Library and Desktop folders.

Solution

If you want administrators to see their home directories instead of volumes when connecting via AFP over the network, follow these steps:

1. Open NetInfo Manager (/Applications/Utilities/).
2. In the NetInfo Manager window, navigate to

   /config/AppleFileServer

3. Locate this property: admin_gets_sp
4. Change the value of the property to 1. (You double-click the value to edit it.)
5. Save the changes in NetInfo Manager.
6. Use the Server Settings application to stop and restart Apple File Service.

Published Date: Oct 7, 2016

Workgroup Manager: How to Add Volumes for Mount at Login

This document explains how to configure additional server volumes to mount at login when managing Mac OS X computers via Workgroup Manager.
This article has been archived and is no longer updated by Apple.
There are two ways to mount additional volumes while logging into a managed Mac OS X client system: automounts or the Login Items managed preference feature. The Group Folder (or Group Volume) is not covered by this document. For the Group Volume, see technical document 107307, "**Mac OS X Server 10.2: How to Configure the Group Volume to Mount When Logging In**".

Using automounts

Share points set to automount are made available to bound clients at startup and automatically mount when accessed. The item can be accessed by navigating to it in the Finder or by opening an application that looks in this specific location.

Refer to page 225 of the Server Admin Guide v10.2.3 for steps for setting up automounts in Mac OS X Server. You may download the guide from document **120174**.

Optionally, you may also add the share point to the user's dock for easy access. It's recommended to configure this from an administrator's client computer, rather than at the server itself. To do that, follow these steps:

1. Log in on a client or admin computer that has this share point automounted.
2. Open Workgroup Manager, and connect to the server.
3. Select the user, group, or computer list for which you would like to manage this setting.
4. Select Preferences.
5. Select Dock.
6. Under the Dock Items tab, drag the volume (from a local Finder window) into the Documents and Folders list.

   Note: The location of the volume in the local file system must match the location of the volume on the client systems. This is why it's not recommended to perform these steps from the server itself.

7. Save the changes by clicking Apply Now.

Login Items

You can use these steps to mount an additional volume without automount.

1. Connect to the server volume(s) you would like to automatically mount at login. It's recommended to do this from an administrator's client computer, rather than at the server itself.
2. Open Workgroup Manager, and connect to the server.
3. Select the user, group, or computer list you would like to manage this setting for.
4. Select Preferences.
5. Select Login.
6. Under the Login Items tab, drag the volume (from the Finder) into the Login Items list. The kind will appear as "Unknown," which is expected behavior.
7. Save the changes by clicking Apply Now.

Optionally, you may add the share point to the user's dock for easy access.

1. In Workgroup Manager, select Preferences.
2. Select Dock.
3. Under the Dock Items tab, drag the volume (from the Finder) into the Documents and Folders list.
4. Save the changes (Apply Now).

When a user logs into the managed account, she sees a Connect To dialog. This is expected behavior, and the user can then authenticate or log in as a guest.

Note: The account used to authenticate (in step 1) will appear in the Connect To dialog box, which is expected behavior. The user can edit the login information and authenticate as needed.

Keychain

When using the Login Items solution, the user may also choose to add the password to her keychain. To do this, click the Options button in the Connect To dialog.
Published Date: Feb 17, 2012

Mac OS X Server: How to Format User Information For Password Server

If you want to use Password Server (rather than Basic) and need to import users from a separate file, format the user information as described in this document.
This article has been archived and is no longer updated by Apple.
Pages 191-193 of Server Admin Guide v 10.2.3 discuss creating an import file with record descriptions. An example on page 192 shows how to import users who use the Password Server.

A record description identifies the fields in each record you want to import from a character-delimited file; it indicates how records, fields, and values are separated; and it describes the escape character that precedes special characters in a record. Encode the record description using the following elements in the order specified, separating them using a space:

- End-of-record indicator (in hex notation)
- Escape character (in hex notation)
- Field separator (in hex notation)
- Value separator (in hex notation)
- Type of accounts in the file (DSRecTypeStandard:Users or DSRecTypeStandard:Groups)
- Number of attributes per account
- List of attributes

When importing user passwords, you can insert the following in the list of attributes to set the user's password service to the Password Server:

```
dsAttrTypeStandard:AuthMethod
```

Then insert the following in the formatted record (in this example, the user's password is "password"):

```
dsAuthMethodStandard\\:dsAuthClearText:password
```

Note: In this example, the colon (:) is the field separator. As there is a colon in the description for this attribute, the escape character must be used to indicate the colon should not be treated as a delimiter. The backslash (\\ ) is the escape character in this example. If the field separator is anything other than the colon, the escape character is not needed.

This is an example of a header from a standard users import file with users who use the Password Server. It must be typed as one line of text in which the elements are separated by spaces and without line breaks, as presented here. Though your browser will wrap the text for presentation, you can see that it contains no line breaks if you copy and paste it into a text editor that has wrapping turned off:

```
0x0A 0x5C 0x3A 0x2C dsRecTypeStandard:Users 8 dsAttrTypeStandard:RecordName dsAttrTypeStandard:AuthMethod
dsAttrTypeStandard:Password dsAttrTypeStandard:UniqueID dsAttrTypeStandard:PrimaryGroupID
dsAttrTypeStandard:Comment dsAttrTypeStandard:RealName dsAttrTypeStandard:UserShell
```

This is an example of a formatted record with the following attributes and values:

```
<Attribute>: <Value>

Record Name (short name): tuser

Authentication Method: dsAuthClearText

Password: password1

Unique ID: 1242

Primary Group ID: 20

Comment: <blank>

Real Name (long name): Terri User

User Shell: /bin/tcsh

tuser:dsAuthMethodStandard\\:dsAuthClearText:password1:1242:20::Terri User:/bin/tcsh
```

Note: This example also uses the colon (:) as the field separator and the backslash (\\) as the escape character.

Mac OS X Server: Computer Stops Responding at "Starting Network Filesystem"

The computer does not finish starting up if it is providing both DNS Service and NFS Service. It stops when the progress bar reaches "Starting Network Filesystem."
This article has been archived and is no longer updated by Apple.

Symptom

During system startup time, the Mac OS X Server computer appears to stop responding ("hangs" or "freezes") when the progress bar reaches the message "Starting Network Filesystem."

Solution

This occurs when you are providing DNS Service on your network and you have client or network NFS exports (not world). If this is not your configuration, review this alternative cause. To recover, follow these steps.

1. Start up the computer in single-user mode.
2. At the prompt, type: /sbin/fsck -fy
3. Press Return.

   The fsck utility will go through five phases and then return information about the disk. If no issue is found, you should see:

   ```
   ** The volume  appears to be OK.
   ```

   ```
   If fsck alters, repairs, or fixes anything, it will display the message:
   ```

   ```
   ***** FILE SYSTEM WAS MODIFIED *****
   ```

   Important: If this message appears, repeat the "/sbin/fsck -fy" command until this message no longer appears. It is normal for your computer to require several passes of fsck, because first-pass repairs may uncover additional issues.

4. Type: /sbin/mount -uw /
5. Press Return.
6. Type: pico /System/Library/StartupItems/NFS/StartupParameters.plist
7. Press Return. This opens the NFS StartupPararmeters preference file in the pico text editor. The file should look like this:

   ```
   {
     Description     = "Sun network file system";
     Provides        = ("NFS");
     Requires        = ("Portmap", "Resolver");
     Uses            = ("Disks");
     OrderPreference = "None";
     Messages =
     {
       start = "Starting network file system";
       stop  = "Stopping network file system";
     };
   }
   ```

   Note: The "Uses" line only appears in Mac OS X Server 10.1.5.

8. Add "Watchdog" to the Requires section. The file will then look like this.

   ```
   {
     Description     = "Sun network file system";
     Provides        = ("NFS");
     Requires        = ("Portmap", "Resolver", "Watchdog");
     Uses            = ("Disks");
     OrderPreference = "None";
     Messages =
     {
       start = "Starting network file system";
       stop  = "Stopping network file system";
     };
   }
   ```

   Note: Do not add a "Uses" line in Mac OS X Server 10.1.4 and below. It will only exist in Mac OS X Server 10.1.5.

9. Press Ctrl-X to exit, then "y" and Return to save the file.
10. Type: reboot

11. Press Return .

The server should start up normally now.

Mac OS X Server 10.2: Share Point Will Not Automount if It Has Custom AFP Name

A share point cannot automount if you give it a custom AFP name. When this issue occurs, a user's home directory may include only the Desktop and Library folders.

This article has been archived and is no longer updated by Apple.

Symptom

A share point does not automount, or a user's home directory only includes the Desktop and Library folders.

Solution

If you have already given a custom AFP name to a share point, change the custom AFP name to match the actual name of the share point (as it appears in the Finder).

For new share points, do not set a custom AFP names for a share point that is set to automount.

Note: To see the AFP custom name setting, select the share point in Workgroup Manager, then click the Protocols tab. Choose Apple File Settings from the pop-up menu. To see if the share point is set to automount, click the Automount tab.

Apple Remote Desktop: Incorrect "Unavailable" Client Status

Remote Desktop may sometimes incorrectly report a client's status as unavailable even though it is available.
This article has been archived and is no longer updated by Apple.

Symptom

A client's status is reported as unavailable when it is actually available.

Note: If the affected client uses Mac OS 9, see related information in technical document 107500, "**Apple Remote Desktop 1.2: "Communication Error" During Multi-Observe, Client Status Incorrect** ".

Solution

Switching to another computer list and back forces the list to refresh, which normally resolves the incorrect report. If another computer list is not available, quit and reopen the Remote Desktop application to force a refresh.

Mac OS X Managed Client: Default Classic System Folder Behavior

This document describes the behavior of the "default System Folder" option for managing Classic Preferences in Workgroup Manager. This applies to Mac OS X Server 10.2 or later.
This article has been archived and is no longer updated by Apple.
When managing Classic Startup preferences, a Classic System Folder may or may not be specified. If no Classic System Folder is specified, the "default System Folder" is used. The "default System Folder" refers to a single Mac OS 9 System Folder on the startup volume.

If no Mac OS 9 System Folder is on the startup volume, or if multiple Mac OS 9 System Folders are on the startup volume, the user sees the following alert message when starting Classic:

"Classic Startup found no system folder on the boot volume from which to start classic."

If there are multiple Classic System Folders installed on the startup volume or you wish to use a Classic System folder installed on a different local volume, use either of these solutions:

Solution 1

Specify which Classic System Folder clients will use in Workgroup Manager.

Notes

1. If you use the Choose button to do this, the volume that contains the Classic System Folder must have the same pathname at the client computer as it does on the administrator's computer. You must select the file "System" in the System Folder (though the resulting pathname will end with "System Folder", not "System Folder/System" as might be expected).

2. If the administrator and client computers have different paths to the Classic System Folder, then you must type the pathname instead of using the Choose dialog. Remember that paths on the startup volume start with root ("/") but that paths for secondary volumes must be preceded by "/Volumes/". For a secondary volume named "Other_Stuff" that contains the Classic System Folder you would type this, for example:

```
/Volumes/Other_Stuff/System Folder
```

Solution 2

Set "Manage these settings" to "Never" in the Startup tab, and allow access to Classic preferences.

Note: Any Classic preference that is managed cannot be edited by a managed user, so it may not be necessary to prevent access to the Classic preferences pane in System Preferences when managing Classic preferences.

Workgroup Manager: "error -14130" or "error -14136" Message When Using LDAP

If LDAP User and Group types are not properly mapped, Workgroup Manager may issue alert messages that contain "error -14130" or "error -14136".

This article has been archived and is no longer updated by Apple.

Symptom

You see one of these alert messages when attempting to connect to an LDAP server, or a similar message:

"error -14130 on line 369 of UserBasicPlugin.mm"
"error -14136 of line 91 of UserVolumePlugin.mm"

Solution

Using the Directory Access application, map the User and Group Types and Attributes to the proper Attributes on the LDAP server. Figure 1 shows a proper mapping for a user's "UniqueID" mapped to the "uidNumber" of Open Directory server. The mapped value depends on the version of LDAP server. Apple's Open Directory server is based on and uses OpenLDAP.

Figure 1

For more information on LDAP and Directory Access, please see the Mac OS X Server Admin Guide.

Mac OS X Server 10.2: Users With Passwords Left Blank Cannot Log In

Users with passwords intentionally left blank are sometimes unable to log in to a server or connect to a share point. If you experience this, you should reset the password as described here.
This article has been archived and is no longer updated by Apple.

Symptom

A user with a blank password cannot log in.

Solution

Follow these steps:

1. In Workgroup manager, select affected user.
2. Look at the Password and Verify fields. Both should show eight bullets, "·····". If the password fields are blank, select another user, then reselect the affected user.
3. Delete the contents of the Password and Verify fields.
4. Click the Save button. A warning about blank passwords should appear.
5. Click OK.

You have reset the blank password, and the user should be able to log in without a password.
Published Date: Feb 17, 2012

Safari: "Times RO" font may prevent some pages from loading

Mac OS X does not require the "Times RO" font, but certain applications may install it. Installation of this font can cause Safari not to load some web pages, or to load them partially.
This article has been archived and is no longer updated by Apple.

Symptom

Some web pages load partially, or don't load at all.

Products Affected

- Safari 1.0 or later
- Mac OS X 10.2.6 to 10.3.3

Solution

For Mac OS X 10.2.6 to 10.2.8

1. If Safari is open, quit it.
2. Check these two folders for for the Times RO font:

   /Library/Fonts/
   ~/Library/Fonts/

3. If you find Times RO, remove it from either or both folders.
4. Open Safari.

For Mac OS X 10.3 or later

Update to Mac OS X 10.3.4 or later to avoid the issue.

Published Date: Oct 7, 2016

Mac OS X Server: About Using "systemsetup" to Select a Startup Volume With a Space in Its Name

When using interactive mode, the "systemsetup" command cannot designate a startup volume whose name contains a space. This document explains the alternative.
This article has been archived and is no longer updated by Apple.

Symptom

You see a message similar to this one:

> "Not a System Folder: /Volumes/Mac Error: OS is not a valid command"

In this example, the volume selection attempted was:

/Volumes/Mac OS X Server/System/Library/CoreServices

Solution

To choose a startup volume with a space in its name, you cannot use the interactive mode of the systemsetup command. You must enter the command arguments directly. For the volume "Mac OS X Server" you would type the command this way:

```
systemsetup -setstartupdisk "/Volumes/Mac OS X Server/System/Library/CoreServices"
```

For more information on the systemsetup command, see page 600 of the Mac OS X Server Admin Guide for 10.2.3 or later, which you may download from document **120174**.

Note: This document discusses only one of several existing methods for changing the startup disk. You may also use the System Preferences application, or you may use the bless command. For an example of the latter, see technical document 107613, "**Mac OS X Server 10.2: How to Select a Startup Disk via SSH**".
Published Date: Oct 7, 2016

Mac OS X Server 10.1: Security Vulnerability With QuickTime Streaming Server Web Admin

The QuickTime Streaming Server web-based admin agent in Mac OS X Server 10.1 to 10.1.5 contains a potential vulnerability that could allow remote users to execute arbitrary code.
This article has been archived and is no longer updated by Apple.
To avoid this vulnerability, you should disable the QTSS web-based admin.

If you are not actively administrating QTSS via the web-based admin, disabling it should not be an issue for you. But if you are actively using the web-based admin, you will need to use one of these two alternatives:

1. Disable the web-based admin, and directly edit the QTSS configuration files instead, or

2. Limit who is capable of connecting to the web-based admin.

The following sections explain how to use either of these alternatives.

How to disable QTSS web-based admin

1. At the server, open Terminal (/Applications/Utilites/).
2. Type: su root
3. Press Return.
4. Enter your "Admin" account password when prompted, and press Return.

Note: The password you need to enter is not the QTSS administrator password. You must be logged into the server as an administrator (designated "Admin" in the Accounts preference pane), and you use the password for that user account.

5. Type: `sed s/QTSSERVER=-YES-/QTSSERVER=-NO-/ /etc/hostconfig > /etc/hostconfig.tmp`
6. Press Return.
7. Type: `mv /etc/hostconfig.tmp /etc/hostconfig`
8. Press Return.
9. Quit Terminal.
10. Restart the server.

How to limit QTSS web-based admin access

1. Open this file in a text editor:

/Library/QuickTimeStreaming/Config/streamingadminserver.conf

Note: If the file is not there, create a new one. This file only contains information that differs from default settings, so it is OK if the file contains only the line that you will choose in the next step -- you do not need any additional information. If you need help opening and editing the file, see technical document 106619, "**Mac OS X Server: How to Locate and Edit Configuration Files**".

2. Place one of the following lines in the streamingadminserver.conf text file, substituting a valid DNS value for either "server_hostname" or "your_domain_name".

To limit access to only web browsers running locally at the server, use this line:

```
allow=127.0.0.1 server_hostname
```

To limit access to web browsers within your domain, use this line:

```
allow=127.0.0.1 *.your_domain_name.com
```

Published Date: Oct 7, 2016

Apple Remote Desktop 1.2: How to Transfer Computer Lists to Another Administrator Account

Apple Remote Desktop version 1.2 stores encrypted computer list information in a user's keychain. An administrator might want to share her computer list with another administrator or transfer the list from one account/computer to another. This document explains how to do that.

This article has been archived and is no longer updated by Apple.

Note: This document applies only to Apple Remote Desktop version 1.2 (for 2.0 or later, look here).

To transfer a computer list from one administrator account to another, follow these steps:

1. The Remote Desktop administrator who wants to share the computer list(s) should log into the computer where they are stored. This is the "source administrator".
2. Open Keychain Access (/Applications/Utilities).
3. Choose File > New > New Keychain.
4. Enter "Export" as the new keychain's name, and click Create.
5. Enter a password for the new keychain. You will need to provide this password to the target administrator, so don't use your own account password or any other sensitive password.
6. Click the Keychains button to open the tray, if not already open.
7. Select the source administrator's main keychain.
8. If the keychain is locked, click the Unlock button to authenticate.
9. Click the Name column to sort the items by name.
10. Select only the Apple Remote Desktop entries, and copy them (Command-C).
11. Select the Export keychain.
12. Paste the entries into the Export keychain (Command-V).
13. You will be asked to provide a password to decrypt each entry. Provide the password of the source administrator's main keychain (not that of the Export keychain).
14. Quit Keychain Access.
15. Click the Finder icon in the Dock.
16. Choose Go > Go to Folder.
17. Type: ~/Library/Keychains/
18. Click Go.
19. Copy the Export keychain to the same location in the home directory of the target administrator. If you cannot copy the file in the target administrator's Keychains folder, you may copy it to the user's drop box (~/Public/Drop Box).
20. At the computer to which the Export keychain was copied (which may be the same computer), log in as the target administrator. If the keychain is in the user's drop box, move it to the Keychains folder (~/Library/Keychains).Open Keychain Access.
21. Choose File > Add Keychain.
22. Select the Export keychain, and click Open.
23. Click the Keychains button to open the tray, if not already open.
24. Select the Export keychain.
25. Select the ARD entries, and copy them. When prompted for the password, enter the one created in step 5.
26. Select the main keychain of the target administrator. If this keychain is locked, click the Unlock button to authenticate.
27. Paste the entries into this keychain.
28. Open Apple Remote Desktop as the target administrator.

After entering the target administrator's name and password, you will see the computer list(s) transferred from the source administrator.

Mac OS X Server: About the Mac OS X Server 10.2.8 Update

This software updates Mac OS X Server 10.2.6 to 10.2.8.

Note: This also includes an updated ethernet driver for 450Mhz and 500Mhz dual processor Power Mac G4 desktop systems. If you downloaded version 10.2.8 before 2003-10-03, you need this update. If you cannot connect to the Internet at the affected computer, see technical document **107669** for workarounds and a description of the issue.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X Server 10.2.8, you must enter the password for an administrator account. The password cannot contain a space or special characters typed by pressing the Option key.

   If you need to change an administrator account password, on the Apple menu click System Preferences; then on the View menu, click Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X Server 10.2.8.

Automatic Software Update

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from **Apple Software Downloads**.

Two versions of the installer are available. One is for updating version 10.2.6 to 10.2.8; the other updates version 10.2, 10.2.1, 10.2.2, 10.2.3, 10.2.4, 10.2.5, or 10.2.6 to 10.2.8 (a "Combo" update). This document describes the former. If you need to use the Combo update, see technical document 107648, "**Mac OS X Server: About the Mac OS X Server 10.2.8 Update (Combo)**".

Enhancements delivered with this update

This update delivers the enhancements outlined below. This installer is server-specific, but the issues it resolves are not. This update provides the same fixes found in the client version of the Mac OS X 10.2.8 Update. The issues described below are relevant in a server setting, but you must also update the client computers.

Directory Services - LDAPv3

The update addresses these issues that could occur when using the LDAPv3 plug-in:

- The first login by a user works normally, but subsequent login attempts do not.
- Clients do not reestablish connection after entering CLOSE_WAIT state.

Background: If a Mac OS X 10.2.7 (or earlier) LDAP client lost its connection to the LDAP server for any reason (such as server timeout, network interruption, or sleep/wake), the LDAPv3 plug-in would sometimes mishandle the transaction and wait for a standard two-minute timeout period to expire before attempting to reconnect. Version 10.2.8 is far better at noticing a lost connection and attempts to reconnect immediately. This improves performance in environments with heavily loaded LDAP servers or LDAP servers with idle disconnect behavior.

Directory Services - Password Server

- Addresses a situation in which Password Server clients could lose the ability to log in after a period of uptime.

Background: Under moderate to heavy load, Password Server could exhaust the server's available socket resources. Mac OS X 10.2.8 resolves the issue by providing proper server-client cleanup in all circumstances, allowing the system to run for longer periods of time.
Published Date: Oct 7, 2016

Mac OS X Server: About the Mac OS X Server 10.2.8 Update (Combo)

This software updates Mac OS X Server 10.2, 10.2.1, 10.2.2, 10.2.3, 10.2.4, 10.2.5, or 10.2.6 to version 10.2.8. It is a "combo" update that combines enhancements delivered with versions 10.2.1 through 10.2.8. If you already have Mac OS X Server 10.2.6, you may download a smaller update that is not a combo.

Note: This also includes an updated ethernet driver for 450Mhz and 500Mhz dual processor Power Mac G4 desktop systems. If you downloaded version 10.2.8 before 2003-10-03, you need this update. If you cannot connect to the Internet at the affected computer, see technical document **107669** for workarounds and a description of the issue.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X Server 10.2.8, you must enter the password for an administrator account. The password cannot contain a space or special characters typed by pressing the Option key.

   If you need to change an administrator account password, on the Apple menu click System Preferences; then on the View menu, click Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X Server 10.2.8.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from Apple Featured Software (http://www.apple.com/swupdates/).

There are two versions of the update installer available:

- "Mac OS X 10.2.8 Server Update (Combo)" updates Mac OS X Server 10.2, 10.2.1, 10.2.2, 10.2.3, 10.2.4, 10.2.5, or 10.2.6 to version 10.2.8. This document describes how to use this installer.
- "Mac OS X Server 10.2.8 Update" updates only Mac OS X Server 10.2.6 to the new version. To learn more about that installer, see technical document 107647, "**Mac OS X Server: About the Mac OS X Server 10.2.8 Update**".

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with Mac OS X Server versions 10.2.1 through 10.2.8. These enhancements are listed individually in these technical documents:

107038: "**Mac OS X Server: About the Mac OS X Server 10.2.1 Update**"
107142: "**Mac OS X Server: About the Mac OS X Server 10.2.2 Update**"
107265: "**Mac OS X Server: About the Mac OS X Server 10.2.3 Update**"
107364: "**Mac OS X Server: About the Mac OS X Server 10.2.4 Update**"
107491: "**Mac OS X Server: About the Mac OS X Server 10.2.5 Update**"
107491: "**Mac OS X Server: About the Mac OS X Server 10.2.6 Update**"
107647: "**Mac OS X Server: About the Mac OS X Server 10.2.8 Update**"
Published Date: Oct 7, 2016

WebObjects 5.2.2: About the WebObjects 5.2.2 Update

This document contains an overview and download information for Apple's WebObjects 5.2.2 Update. WebObjects 5.2 users who plan to develop their WO applications on Mac OS X 10.3 Panther or who use the Xcode development tool suite or plan to deploy their WO 5.2.2 applications on Mac OS X Server 10.3, Windows or Solaris should install this update.
This article has been archived and is no longer updated by Apple.
Technical document 70037, "**WebObjects Current Patch List**", contains information on all available patches and updates for all versions of WebObjects. Read this document if you're not sure which update you need on your system.

This update addresses the issues and adds support for the features listed below:

- Incompatibilities between WebObjects 5.2 development tools and Xcode 1.0
- Incompatibilities between WebObjects 5.2 and Java 1.4.1 for Mac OS X
- Incompatibilities between WebObjects 5.2 and Mac OS X 10.3
- Fixes for the Enterprise Object Frameworks runtime
- Fixes for WOFileUpload
- Provide tighter integration between WebObjects 5.2 and the new JBoss features on Mac OS X 10.3 Server

Important: WebObjects 5.2.2 requires Java 1.4.1. Java 1.3.1 is no longer supported.

Important: You will not be able to use legacy ProjectBuilder to develop WebObjects applications after installing this update.

The **WebObjects Current Patch List** contains information on all available patches and updates for all versions of WebObjects. Read this document if you're not sure which update you need on your system.

WebObjects 5.2.2 Developer for Mac OS X 10.3

Important: Support for developing WebObjects applications using legacy Project Builder and JDK 1.3.1 have been dropped in WebObjects 5.2.2 update.

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system is visible and available for download. If you prefer to download and install the package manually, follow the instructions below.

Note: WebObjects 5.2.2 Developer requires:

- Mac OS X 10.3 or later
- JDK 1.4.1
- Xcode 1.0 Developer Tools

If you have not yet updated to the correct version of Mac OS X or Developer Tools, you must do so before installing WebObjects 5.2.2.

If you are creating a new Mac OS X WebObjects 5.2 development system, you should install the software in the following order:

1. Mac OS X 10.3
2. Xcode 1.0 Developer Tools
3. WebObjects 5.2 Developer
4. WebObjects 5.2.2 Developer

Manually Installing WebObjects 5.2.2 Developer on Mac OS X 10.3

These instructions are for manually downloading and installing WebObjects 5.2.2 Developer. If you are installing using Software Update, see the previous section of this document, WebObjects 5.2.2 for Mac OS X 10.3.

Note: WebObjects 5.2.2 Developer requires:

- Mac OS X 10.3 or later
- JDK 1.4.1
- Xcode 1.0 Developer Tools

If you have not yet updated to the correct version of Mac OS X, Java, or Developer Tools, you must do so before installing WebObjects 5.2.2.

1. Download WO522Developer.pkg.tar, the update package for Mac OS X 10.3. The update is available from:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.2/WO522Developer.dmg

The disk image should expand when double clicked in the finder, leaving WO522Developer.pkg.

2. Open WO522Developer.pkg.

The Authenticate panel opens.

Important: Only an administrator can install the update.

3. Type the proper administrator name and password to authenticate.

4. Click OK to proceed. The Introduction panel appears.

5. Click Continue. The Software License Agreement appears.

6. Read the software license agreement, then click Continue.

7. Click Agree to agree to the license agreement and continue the installation.

8. Select the volume containing Mac OS X and WebObjects 5.2 Developer.

9. Click Continue.

10. Make sure that there are no WebObjects or EOF applications running.

11. Click Install to proceed with installation. The Installer window displays information about the progress of the installation, which may take several minutes.

12. Restart your computer.

WebObjects 5.2.2 Deployment for Mac OS X 10.3 Server

WebObjects 5.2.2 deployment now comes pre-installed on Panther Server only. To install WebObjects 5.2.2. Deployment, install or upgrade to Mac OS X 10.3 Server.

Configuration tasks:

1. wotaskd is not configured to autostart by default. Open the file /System/Library/StartupItems/WebObjects/WebObjects and uncomment the following line:

```
#/usr/bin/su appserver -c "$WOSERVICE -appPath $WOTASKD" >/var/log/webobjects.log 2>&1 &
```

2. If you are planning to use Apache, you will need to update the httpd.config file. Add the following to the end of the file /etc/httpd/httpd.config:

```
# Including WebObjects Configs
Include /System/Library/WebObjects/Adaptors/Apache/apache.conf
```

Installing WebObjects 5.2.2 on Windows 2000

Notes

1. During the installation, if you see panels indicating that certain files being replaced by the update are "locked", click Reboot to continue the installation. The files will be replaced upon restarting.
2. This update cannot be uninstalled alone. Once you have upgraded to WebObjects 5.2.2 you cannot revert to WebObjects 5.2. However, the entire WebObjects 5.2.2 installation can be uninstalled using the Add/Remove Programs control panel.

Steps

1. Install JDK 1.4.1 if not yet installed (available from http://java.sun.com). This version is required.

2. Download WO522.exe, the self-extracting update installer for Windows 2000.

The update is available from:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.2/WO522.exe

3. Log in as a user with Administrator privileges.

4. Make sure that there are no WebObjects or EOF applications running.

5. Double-click on the update installer, WO522.exe, to start the installation process. A screen appears with some information about this update.

6. After you have read the information screen, click Next to continue. The license agreement for this update appears.

7. To agree to the license and continue the installation, click Yes. The update will be installed on your system and you will be asked if you want to restart.

8. Select "Yes, I want to restart my computer now" to restart Windows.

The WinZip self-extractor automatically quits and removes its temporary files in about 20 seconds.

Installing WebObjects 5.2.2 on Solaris

1. Install JDK 1.4.1, if not yet installed (available from http://java.sun.com). This version is required.

2. Download WO522Solaris.TAR.Z, the update installer for Solaris.

Note: You will also need to download the update installation script, patcher.sh.

The update is available from:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.2/WO522Solaris.tar.gzip

The installation script is available at:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/scripts/patcher.sh

After you have downloaded the files, the patcher.sh script needs its executable bit set. At the command prompt enter:

chmod 511 patcher.sh

3. Log in as root.

4. Make sure that there are no WebObjects or EOF applications running, including Monitor.

5. If a web server is running on the computer on which you are installing the update, stop it.

6. Stop WebObjects services (wotaskd and woservice) using the WOServices script. At the command prompt enter:

cd $NEXT_ROOT/Library/WebObjects/Executables ./WOServices stop

These services will restart when you restart the computer after installing the update.

7. To Install the update, cd to the directory containing the update and the patcher.sh installation script. Then at the command prompt enter:

patcher.sh -install WO522Solaris.TAR.Z

For more information on using patcher.sh, at the command prompt enter:

patcher.sh -help

8. Copy the updated WODocument root to your web server's document root.

cp -r $NEXT_ROOT/Library/WebObjects/WODocumentRoot/WebObjects <webserver doc root>/WebObjects

9. Restart your computer.

Issues resolved in WebObjects 5.2.2

EOBeanBuilder does not handle entities with relationships properly.

Apple Reference 3012075

ISSUE:

EOBeanBuilder does not handle entities with relationships properly.

RESOLUTION:

This issue has been resolved and support for Container Managed Persistence 2.0 (CMP) in Enterprise Java Beans (EJBs) have been added.

WOFileUpload is improperly setting filePath when no file is uploaded.

Apple Reference 3078140

ISSUE:

Sometimes the filePath binding was munged after repeated uploads.

RESOLUTION:

If the user submits a file upload without a filepath binding, the filePath string will be set to "".

EOModeler does not support double quotes in building qualifiers.

Apple Reference 3081517

ISSUE:

When double quotes are used in building qualifiers, an extra space is added to the end of the qualifiers. For example, (title like "A*") would be treated as (title like A*), which breaks the data browsing and filtering functionality.

RESOLUTION:

This issue has been resolved.

wotaskd does not launch upon start up after specifying it to launch using a non-root user.

Apple Reference 3088811

ISSUE:

A few double quotes are misplaced in the startup script /System/Library/StartupItems/WebObjects.

RESOLUTION:

This issue has been resolved.

The class EOAttribute throws the exception ClassCastException when illegal arguments are encountered under certain situations.

Apple Reference 3101631

ISSUE:

The method adaptorValueByConvertingAttributeValue() defined in the class EOAttribute throws the exception ClassCastException when illegal arguments are encountered.

RESOLUTION:

The exception IllegalArgumentException is thrown upon encountering illegal arguments.

Content encoding related exceptions are thrown when WebObjects encounters Chinese/Japanese characters.

Apple Reference 3135465

ISSUE:

WebObjects determines the content encoding based on HTTP headers only and ignores other encoding information in XML content.

RESOLUTION:

This issue has been resolved.

Checked boxes generated by WOCheckedboxMatrix do not align correctly in some cases.

Apple Reference 3148863

ISSUE:

If the text to the right of the checked boxes takes more than one line and if it wraps, the checked boxes are aligned between the lines instead of aligning at the first line.

RESOLUTION:

This issue has been resolved.

Accesses to EOObjectStore are blocked after calling EODatabaseDataSource.qualifyWithRelationshipKey() in some cases.

Apple Reference 3177592

ISSUE:

The lock acquired by calling EODatabaseDataSource.qualifierForRelationshipKey() never gets released.

RESOLUTION:

This issue has been resolved.

The name "shared" cannot be used as an attribute name for an entity in WebObjects 5.2, but it can in WebObjects 5.0.

Apple Reference 3179807

ISSUE:

Some private methods introduced to EOCustomObject in WebObjects 5.2 conflict with users specified property names.

RESOLUTION:

This issue has been resolved.

The Object Inspector of WebObjects Builder does not handle binding values started with the character "^" correctly.

Apple Reference 3179819

ISSUE:

Whenever a value started with "^" get assigned to a binding using Object Inspector, the binding value get double-quoted undesirable

RESOLUTION:

This issue has been resolved.

WebObjects Builder does not handle binding value starting with the character "-" correctly.

Apple Reference 3180520

ISSUE:

Whenever WebObjects Builder encounters a binding value starting with the character "-", it interprets it as an incorrect declaration.

RESOLUTION:

This issue has been resolved.

The binding "overwrite" in the WOFileUpload example shipped in WebObjects 5.2 is not being respected.

Apple Reference 3188888

ISSUE:

There are some issues with files renaming in some cases, which causes overwriting to fail.

RESOLUTION:

This issue has been resolved.

JDBCContext does not respect the value returned by EOAdaptorContext.Delegate.adaptorContextShouldCommit()

Apple Reference 3190939

ISSUE:

Even if EOAdaptorContext.Delegate.adaptorContextShouldCommit() returns true, JDBCContext always does the commit instead of delegating the responsibility to the delegate.

RESOLUTION:

This issue has been resolved.

False warnings about missing locks are issued in some cases inside the method EOEditingContext._undoManagerCheckpoint() .

Apple Reference 3192337

ISSUE:

Certain assertion checks in EOEditingContext are invalid.

RESOLUTION:

This issue has been resolved.

NullPointerException is thrown in EOAttribute.adaptorValueType() upon generating an error message.

Apple Reference 3192384

ISSUE:

If an illegal internal type presents in the definition of a stored procedure, EOAttribute.adaptorValueType() would throw an NullPointerException upon generating an error message.

RESOLUTION:

This issue has been resolved.

NSTimeZone.timeZoneWithName() returns null in some cases, when handling certain names and abbreviations of some well-known time zones in JVM 1.4.1.

Apple Reference 3203985

ISSUE:

Some new names/abbreviations for well-known time zones was introduced in Java Virtual Machine (JVM) ver. 1.4.1. NSTimeZone.timeZoneWithName() could not handle those names/abbreviations.

RESOLUTION:

This issue has been resolved.

willRead() will throw a NullPointerException when an EO is in an invalid state.

Apple Reference 3223265

ISSUE:

EOCustomObject can throw an NullPointerException in willRead() if the EO is either not inserted in an EOEditingContext or is somehow a zombie.

RESOLUTION:

It now throws an IllegalStateException instead.

The width of some JComboBoxes in Direct to Java Client applications is not scaled according to the list of selectable values.

Apple Reference 3252950

ISSUE:

In some cases JComboBox.getPerferredSize() returns less than optimal dimension in Java Virtual Machine ver. 1.4.1.

RESOLUTION:

This issue has been resolved.

EOEditingContext throws NullPointerException in some cases.

Apple Reference 3252964

ISSUE:

In some cases notifications are sent to an already disposed nested EOEditingContext.

RESOLUTION:

This issue has been resolved.

There is an extra non-black space in the closedLabel attribute of the WOCollapsibleComponentContent.

Apple Reference 3252969

ISSUE:

The closedLabel attribute of the WOCollapsibleComponentContent contains an extra non-blank space.

RESOLUTION:

This issue has been resolved.

An error message is returned to Safari by Apache Web Server upon calling session.terminate().

Apple Reference 3253004

ISSUE:

Cookies expiration is not being handled correctly, which causes issues with Safari and Apache Web Server.

RESOLUTION:

This issue has been resolved.

The binding codebase of WOApplet is being ignored.

Apple Reference 3255852

ISSUE:

The binding code base of WOApplet is not being respected.

RESOLUTION:

This issue has been resolved.

Interface Builder crashes upon opening the MainMenu.nib file of a Cocoa Enterprise Objects Application project.

Apple Reference 3319422

ISSUE:

When a Cocoa Enterprise Object Application project was created, a MainMenu.nib file was created by default. Upon opening such nib file, Interface Builder crashes.

RESOLUTION:

This issue has been resolved.

An alter panel was displayed when launching Interface Builder on a system with Java Virtual Machine (JVM) ver. 1.4.1 installed as default JVM.

Apple Reference 3319683

ISSUE:

Although the system default JVM was 1.4.1. Interface Builder still uses JVM 1.3.1 in some cases, which causes an error java.lang.UnsupportedClassVersionError.

RESOLUTION:

This issue has been resolved.

Upon disposing an editing context, NSDelayedCallbackCenter throws an IllegalArguementException in some cases.

Apple Reference 3323451

ISSUE:

Upon disposing an editing context, an IllegalArgumentException was thrown in NSDelayedCallbackCenter._cancelAllActionsWithTarget() due to encountering an array out of bound issue.

RESOLUTION:

This issue has been resolved.

Troubleshooting:

1. My application is throwing the exception "com.webobjects.foundation.NSForwardException for java.lang.NoClassDefFoundError: javax/servlet/ServletContext"

For some reason, the necessary packages are not in your classpath. Debug your classpath to make sure the javax.servlet.* classes are there. If the classes are not found, the resolution is to download the servlet.jar and put it into /Library/Java/Extensions or in your classpath. The servlet.jar can be found with

many open source distributions (e.g tomcat).

2. How do I convert my legacy WebObjects application to build as a true war bundle?

1. In Xcode, configure your build settings to the following:

```
SERVLET_SINGLE_DIR_DEPLOY = NO
SERVLET_STUB_WAR = NO
SERVLET_TRUE_WAR = YES
SERVLET_DEPLOY_LICENSE = <your deployment license>
SERVLET_WEBAPPS_DIR = /Library/JBoss/3.2/deploy
```

2. add the JavaWOJSPServlet.framework to your project

3. You should also verify that all of your custom frameworks are being built as jar files and are installed or linked into /Library/WebObjects/lib.

Apple Hardware Test: May Incorrectly Report That Bluetooth Is Not Present

Apple Hardware Test may incorrectly report that the Bluetooth module is not present. You may use Apple System Profiler to test for presence of the module.

This article has been archived and is no longer updated by Apple.

Symptom

Apple Hardware Test (AHT) may state that the Bluetooth module is not present when it actually is present.

Solution

To verify presence of the module:

1. Restart the computer from the hard disk.
2. Open Apple System Profiler (/Applications/Utilities/).
3. Click the Devices and Volume tab.
4. Look to see if the Bluetooth module appears on the USB bus (Figure 1).

Apple Remote Desktop: How to Manage a "Dual Boot" Computer From One Computer List

When configured properly, you may manage a computer that starts up alternatively from Mac OS 9 and Mac OS X (also known as "dual boot") from a single computer list.
This article has been archived and is no longer updated by Apple.
You can manage the client from the same list when both of the following are true:

1. The Remote Desktop administrator's password is the same for Mac OS 9 and Mac OS X. (See Notes, below.)

2. The client computer was added to the list while started up from Mac OS 9, entering both the name and the password (not just the password).

Notes:

1. In Mac OS 9, the Remote Desktop administrator's password is set in the Remote Desktop Security application.

2. In Mac OS X, the Remote Desktop administrator's password belongs to a user who has been granted privileges in the Remote Desktop System Preferences pane.

Example

This example illustrates the configuration, using the name "ARD User" and the password "Apple".

1. In Mac OS X, create a user named "ARD User" with the password "Apple".
2. In the Remote Desktop System preference pane, give this user access.
3. Change the startup system folder to Mac OS 9, and restart the computer.
4. Open Remote Desktop Security, and authenticate.
5. Change the current administrator's password to "Apple".
6. While the computer is still started up from Mac OS 9, add it to the computer list in the Remote Desktop application. When entering the authentication info, enter both the user name ("ARD User") and the password ("Apple").

The computer will now appear in the list whether started up from Mac OS 9 or Mac OS X.

Mac OS X 10.2 or Later: Firewall Blocks Internet Sharing

If you don't open an extra port, Firewall will block the use of Internet Sharing.
This article has been archived and is no longer updated by Apple.

Symptom

A client of your shared Internet connection can get an IP address from your computer, but it cannot actually access the Internet.

Solution

These steps open port 443, which should resolve the issue.

1. Turn on Personal Web Sharing in the Sharing preference pane.
2. Click the Firewall tab.
3. Click the New button.
4. From the Port Name pop-up menu, choose Other.
5. In the Port Number field, type: 443
6. In the description field, type: https

7. Click OK.
8. Turn off Firewall and Internet Sharing.
9. Turn on Firewall and Internet Sharing.

Mac OS X Managed Client: How to allow use of unbundled applications in Mac OS X 10.2, 10.3

This article has been archived and is no longer updated by Apple.

This document explains how to allow the use of unbundled applications when managing clients. You need to do this when applications open sub-applications which have no bundle ID.

This document applies to the Workgroup Manager component of Mac OS X Server 10.2, when used to manage Mac OS X 10.2 or later clients. For Mac OS X Server 10.3, use the "Allow UNIX tools to run" option, which can be found in the Application Managed Preference section of Workgroup Manager. Mac OS X 10.2 and 10.3 client systems will respect this setting when bound to a 10.3 server. Similarly, 10.2 and 10.3 client systems will respect this setting when bound to a 10.2 server.

Note: This advanced procedure requires manual editing of a value in NetInfo Manager. This is provided for information purposes only. Apple does not provide any further technical support or assistance for performing this task.

About unbundled applications

An unbundled application is an executable that does not have an assigned Type/Creator or Bundle ID. Some applications open (or launch) unbundled application utilities to perform certain tasks. When one application launches another, it is known as "sub-launching."

Unbundled applications cannot be sub-launched if you are managing applications and have deselected the preference for "User can also open all applications on local volumes".

To allow sub-launching in this scenario, you may use the procedure below.

Note: To locate the "User can also open all applications on local volumes" setting discussed here, you would select your managed user or group in Workgroup Manager, then click the Preferences icon, then click the Applications icon. The adjacent setting "Allow approved applications to launch nonapproved applications" is not relevant to unbundled applications.

Part I: Preparing Workgroup Manager and NetInfo Manager

1. Open Workgroup Manager (/Applications/Utilities), and connect to your server.
2. Using the Preferences, enable the option to "Allow approved applications to launch nonapproved applications" for each of the Users, Groups, and Computer Lists that you will be allowing unbundled applications to launch within.
3. Apply the changes, and quit Workgroup Manager.
4. Open NetInfo Manager (/Applications/Utilities).
5. Choose Domain > Open By Tag.
6. Enter the host name or IP address of the server that manages the Mac OS X Clients.
7. Enter the NetInfo database tag for that server (Default: network).
8. Click the Open button to connect to the designated server and NetInfo domain.
9. Choose Security > Authenticate.
10. Enter the necessary authentication information, and select OK.

Part II: Locate and Copy mcx_settings

1. In NetInfo Manager, navigate to the user, group, or computer list that you will be allowing unbundled applications to launch within. For example, to edit the group "8thgrade", navigate to /groups/8thgrade in NetInfo Manager. To edit the computer list "Macs near me", navigate to "/computer_lists/Macs near me" in NetInfo Manager.
2. Locate the mcx_settings property, and select its value by double-clicking the field to its right. All of the text should be highlighted.
3. Choose Edit > Copy.

Part III: TextEdit

1. Open TextEdit (/Applications/). A new, untitled document should appear. If not, create a new document.
2. Choose Format > Make Plain Text.
3. Choose Edit > Paste.
4. Choose File > Save As.
5. Name the file "mcx_settings.org.plist", and click Save.
6. Select the file you just saved in the Finder.
7. Choose File > Duplicate.
8. Name the copy "mcx_settings.plist".

9. Open the mcx_settings.plist file in TextEdit.
10. Locate the AlwaysAllowedList-Raw dictionary (<dict>) under the mcx_preference_settings domain.

Note: If this dictionary is not present, then applications are not being managed for this user, group, or computer list. There may be multiple instances of this dictionary. Only edit the dictionary located under the mcx_preference_settings (Figure 1).

Figure 1 The AlwaysAllowedList-Raw dictionary

11. Add this text just above the AlwaysAllowedList-Raw dictionary, as in Figure 2:

```
<key>AllowUnbundledApps</key>
<true/>
```

Figure 2 The AllowUnbundledApps key

12. Save the changes.

Note: You can test the validity of your plist file by attempting to open it in the Plist Editor application (installed with the developer tools, also found on the NetBoot for Mac OS 9 CD). If the file does not open in Plist Editor, there may be an issue with how you added the key.

13. Choose Edit > Select All.
14. Choose Edit > Copy. (You should be copying all contents of the mcx_settings.plist file to the clipboard.)

Part IV: Replacing mcx_settings

1. Switch to the NetInfo Manager application.
2. Select the mcx_settings value that you previously copied from NetInfo Manager in Section II.
3. Choose Edit > Paste.

Note: You can use the Up and Down Arrow keys to scroll down and verify that text was successfully pasted.

4. Save the changes in NetInfo Manager.
5. Confirm the modification by clicking the "Update this copy" button.

Part V: Additional Users, Groups, or Computers

Repeat the steps in Part I through Part IV for each additional managed user, group, or computer list you would like to be able to open unbundled applications.

Part VI: Empty the Cache

1. Via Workgroup Manager, select your managed computer list(s) and click the Empty the Cache button.
2. Restart your managed client computers.

Upon subsequent logins, the users, groups, and computer lists you edited will now be able launch unbundled applications.

Server Monitor: What Triggers Email Notifications?

You can configure Server Monitor to send email notifications of certain events. Events that generate a notification email are listed here.

This article has been archived and is no longer updated by Apple.

Drives

Server Monitor sends a notification email if the number of drives changes.

Power

Voltage rails: 12, 5V, 3.3V, 2.5V, Logic (1.7V), Processor (CPU specific)

Server Monitor sends email notification when:

- A voltage rail crosses a threshold of +/-5% (warning message).
- A voltage rail crosses a threshold of +/-10% (failure message).
- A voltage rail returns to acceptable value (normal message).

Network

There are no warning emails in this category.

Temperature

Nominal temperature for the enclosure is 40C. Thresholds occur at nominal +15C and +25C. Processor temperature is CPU specific, with thresholds at +5C and +10C.

Server Monitor sends email notification when:

- Enclosure temperature crosses 55C (warning message).
- Enclosure temperature crosses 65C (failure message).
- Processor temperature crosses nominal +5C (warning message).
- Processor temperature crosses nominal +10C (failure message).

Blowers

This applies to blowers for enclosure and processor.

Server Monitor sends email notification when:

- A blower is less than 1000 RPMs (warning message).
- A blower is less than 661 RPMs (failure message).

Security

Server Monitor sends email notification when the enclosure is opened or closed.

Published Date: Feb 17, 2012

Safari: A Website Does Not Work as Expected

Sometimes certain features on a website may not work as expected. This document explains what to do when that happens.
This article has been archived and is no longer updated by Apple.

Symptom

A particular website, or one of its features, does not work as expected.

Solution

When a particular website does not work as expected, the issue may be caused either by the site itself or by the software on your computer. Sometimes you can resolve the issue by updating your software, or by performing other troubleshooting.

You cannot identify the cause of the issue in all cases, so it may help engineers identify the issue If you send feedback to Apple and the affected website. To send feedback to Apple, choose Safari > Report Bugs to Apple.

For troubleshooting that you can perform yourself, see technical document 107657, "**Safari: Safari Unexpectedly Quits**". Even if Safari does not actually quit, the steps you can use to troubleshoot unexpected website behavior are the same in either case.
Published Date: Feb 19, 2012

Mac OS X Server: How Many NetBoot Clients Can Connect to a Server

This document explains how many clients you can connect to a NetBoot server using Mac OS X Server versions 10.0 and later. **Note:** This document covers Mac OS X Server versions 10.0 and later. For versions 1.0 to 1.2, see technical document 60144, "**Mac OS X Server: How Many NetBoot Clients Can Connect to a Server**".
This article has been archived and is no longer updated by Apple.
The number of NetBoot client computers you can connect to your server depends on server hardware and a number of other factors.

Server Hardware

A NetBoot server with these specifications can easily support 50 NetBoot client computers:

- PowerPC G3 or G4 microprocessor at 400 MHz or faster
- 256 MB of memory (RAM)
- Gigabit Ethernet and/or a four-port, 100BASE-T or faster Ethernet card
- Two or more hard disks of 9 GB or larger (Multiple hard disks allow more efficient NetBoot operation.)

Note: For best performance and reliability, avoid starting up more than 20 computers simultaneously. After a few moments, you may start up the next 20 computers.

Other Factors

If you want to support more than 25 client computers or use a server that has a different configuration, consider these factors:

Ethernet speed
For best performance, use 100BASE-T or faster connections for both client computers and the server.

Hard disk capacity and number of NetBoot clients
The NetBoot server requires a certain amount of hard disk space for each client connected to it. The amount of space depends on the size and configuration of the system image.

Hard disk capacity and number of users
If you have a large number of users, consider adding a separate file server to your network to store user documents. User documents and preferences are stored by default on the NetBoot server when you use Macintosh Manager, but any Apple Filing Protocol (AFP) server can store this information.

Location of server and client
NetBoot client computers that must use BootP must be located on the same subnet as the server, and there can be only one BootP server on that subnet. However, there can be multiple NetBoot servers serving images on the same subnet.

Number of Ethernet ports on the server
If you have a four-port Ethernet card at the server, distributing NetBoot clients over the ports offers a performance advantage. You can add ports by adding Ethernet cards, or by using several ports on a multi-port Ethernet card. Each port must serve a distinct segment.

Shadow image
As a client starts up from a NetBoot server, it creates a shadow image on the server's hard disk. Each NetBoot client's shadow image takes up the full space of a system disk image for a short time. The size of the server's shadow disk image increases and decreases as needed.

Open Firmware: Password Not Recognized When It Contains the Letter "U"

If you used Open Firmware Password utility to create a password that contains the capital letter "U", your password will not be recognized during the startup process (when you try to access Startup Manager, for example).

This article has been archived and is no longer updated by Apple.

Symptom

Your Open Firmware password is not recognized during startup.

Solution

Don't use a capital letter "U" when setting up an Open Firmware password. Change your password if necessary.

For more information, see technical document 106482, "**Mac OS X 10.1, 10.2: How to Set Up Open Firmware Password Protection**".

WebObjects 5: How to Specify the Character Encoding for a Web Browser

A WebObjects application may set the character encoding used by the client Web browser so that international characters are displayed correctly.
This article has been archived and is no longer updated by Apple.
Character encodings can be set at various places in a WebObjects application, such as string encoding for session data, XML encoding, database server encoding, or the encoding used to communicate with the client Web browser. This document only discusses the latter.

It is important to select the proper character encoding and initialize WebObjects accordingly, so that the characters of your chosen language are displayed correctly. This document discusses using Japanese characters, but this information can be used for other languages as well.

Setting the encoding inside WebObjects

UTF-8, which is a way to represent Unicode, covers a wide range of Japanese characters and allows Japanese text to be mixed with other languages (European, Asian, and so forth). Therefore, this encoding is preferred compared to other Japanese-only encodings such as Shift-JIS.

In your Application.java file, override two methods, takeValuesFromRequest() and appendToResponse() to specify the proper encoding (UTF-8 is used as an example here). The method appendToResponse() also sets the proper encoding in each WOResponse header.

```
      public void takeValuesFromRequest(WORequest r, WOContext c) {
        r.setDefaultFormValueEncoding("UTF8");
        super.takeValuesFromRequest(r,c);
    }

    public void appendToResponse(WOResponse r, WOContext c) {
        r.setContentEncoding("UTF8");
        super.appendToResponse(r,c);
        r.setHeader("text/html;charset=utf-8", "Content-Type");
    }
```

See Sun's encoding documentation (http://java.sun.com/j2se/1.3/docs/guide/intl/encoding.doc.html) to determine the correct encoding for your environment.

Example: Resolving a browser display problem when using Shift_JIS (JIS X0208:1997)
Problem description: Web browser does not display correctly the vendor specific characters
Encoding used: Shift_JIS

Solution:

1. Windows-31J is the correct character set for displaying the vendor specific characters.

2. Modify the character encoding to "MS932", Windows Japanese.

3. The request header should be set to ("text/html;charset=Windows-31J", "Content-Type")

Code example:

```
public void takeValuesFromRequest(WORequest r, WOContext c) {
        r.setDefaultFormValueEncoding("MS932");
        super.takeValuesFromRequest(r,c);
    }

    public void appendToResponse(WOResponse r, WOContext c) {
        r.setContentEncoding("MS932");
        super.appendToResponse(r,c);
        r.setHeader("text/html;charset=Windows-31J", "Content-Type");
    }
```

For more information, see:

Microsoft Windows Codepage : 932 (Japanese Shift-JIS)
<http://www.microsoft.com/globaldev/reference/dbcs/932.htm?&gssnb=1>

Mapping Differences Between JIS X 0221 and Code Page 932
<http://support.microsoft.com/default.aspx?kbid=286776>

Windows31-J and other character sets
<http://www.iana.org/assignments/character-sets>

Important: On Mac OS X, Internet Explorer may not display the Japanese characters correctly even with the MS932 encoding. Use Safari 1.0 or later instead.

Apple Remote Desktop: About the ARD 1.2.4 Update for Mac OS X

This software updates Apple Remote Desktop to version 1.2.4 on computers using Mac OS X 10.1 or later.

Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
2. To install Apple Remote Desktop 1.2.4, you must enter the password for an administrator account. The password cannot contain a space, or special characters typed by pressing the Option key. If you need to change an administrator account password, use Accounts preferences.
3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Apple Remote Desktop 1.2.4.

Software Update

You may have been referred to this document by Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from **Apple Downloads**.

Enhancements delivered with this update

These are some of the enhancements delivered with the Apple Remote Desktop v1.2.4 Update:

- Large files copy up to 30 percent faster on 100BASE-T networks.
- Improves performance when using the Observe, Control, or Sharing screen on 100BASE-T networks.
- Includes new Apple Remote Desktop menu extra icons and status indicators.
- Includes a new command line tool can be used in lieu of the GUI preference pane.
- Includes new defaults keyword AdminConsoleAllowsRemoteControl, which allows you to administer a client that is also running the administration application.
- Computer status windows no longer "flicker" when Apple Network Assistant 3 clients are present.

Xserve: How to Enable Ethernet Jumbo Frames on the PCI Gigabit Card

Learn how to enable Jumbo Frames on supported Ethernet PCI network interfaces.
This article has been archived and is no longer updated by Apple.
Warnings:

1. All devices on a local network must be configured to use Jumbo Frames, or loss of connectivity could occur on that network.

2. All devices on the local network must support use of Jumbo Frames. Few network switches support Jumbo Frames, and sending them to a switch that does not support them may cause the switch to stop operating. Check the specifications of network hardware prior to enabling Jumbo Frames. Even if your devices are Jumbo Frame compatible, Jumbo Frames are not needed under most circumstances. Be sure you have a need for them before using this procedure.

3. This procedure is intended only for computers with Mac OS X Server and the PCI Gigabit Card, or for the Xserve G5. Jumbo Frames can be used on the built-in Ethernet port **only** on the Xserve G5.

Enabling Jumbo Frames

If you have Mac OS X Server 10.3 or later, you can set up Jumbo Frames via normal administration applications. The steps below would not be needed.

If you have Mac OS X Server 10.2.4 to 10.2.8, follow these steps to create a script that is executed during startup:

Warning: Users who are unfamiliar with command line interface and manual configuration in general should proceed with caution or preferably seek assistance. Assistance in setting up or creating Startup Items is not part of Apple's complimentary technical support for new products. Users interested in fee-based support for setting up and creating Startup Items or shell scripts should contact Apple Professional Services (http://www.apple.com/services/). If you do not follow these steps precisely, the script may not work, which could prevent the computer from starting up normally.

1. Make sure you are logged in with an administrator account.
2. Open Terminal (/Applications/Utilities).
3. Type: `mkdir -p /Library/StartupItems/JumboFrame`
4. Press Return.
5. Type: `cd /Library/StartupItems/JumboFrame`
6. Press Return.
7. Type: `pico JumboFrame`
8. Press Return.
9. In the pico editor, paste in the following text.

Begin copying below this line.

```
#!/bin/sh

##
# Configure kernel parameters for Jumbo Frame support
##

. /etc/rc.common

StartService ()
{
ConsoleMessage "Configuring for Jumbo Frames"

if [ "${JUMBOFRAME:=-NO-}" = "-YES-" ]; then

/usr/sbin/sysctl -w  net.inet.raw.maxdgram=16384
/usr/sbin/sysctl -w  net.inet.raw.recvspace=16384
/usr/sbin/sysctl -w  net.inet.tcp.sendspace=65536
/usr/sbin/sysctl -w  net.inet.tcp.recvspace=65536
/usr/sbin/sysctl -w  net.inet.udp.recvspace=65536

fi

}

StopService ()
{
```

```
return 0
}

RestartService ()
{
return 0
}

RunService "$1"
```

End copying above this line.

10. Save the file (Control-O, Return), and exit pico (Control-X).
17. Type: `chmod 755 JumboFrame`
18. Press Return.
19. Type: `pico StartupParameters.plist`
20. Press Return.
21. Paste the following text into the pico editor:

Begin copying below this line.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple Computer//DTD PLIST 1.0//EN"
"http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
        <key>Description</key>
        <string>Can set Jumbo Ethernet Frames</string>
        <key>OrderPreference</key>
        <string>None</string>
        <key>Provides</key>
        <array>
                <string>JumboFrame</string>
        </array>
        <key>Requires</key>
        <array>
                <string>Network Configuration</string>
        </array>
</dict>
</plist>
```

End copying above this line.

22. Save the file (Control-O, Return) and exit pico (Control-X).
23. Type: `chmod 644 StartupParameters.plist`
24. Press Return.
25. Type: `sudo pico /etc/hostconfig`
26. When prompted, enter your account password.
27. Press Return.
28. In the pico editor, add this line at the bottom (use the down arrow key to navigate to the file end):

```
JUMBOFRAME=-YES-
```

29. Save it (Control-O, Return) and exit pico (Control-X).

When you restart the computer, the script makes the kernel parameter settings necessary to support Ethernet Jumbo Frames. Once that is done, you can enable Jumbo Frames on the PCI Gigabit port using this command:

```
sudo networksetup -setMTU en1 9000
```

If your PCI Gigabit card has a port name different from "en1", you should change the port name in the command to match. Repeat this command if you have multiple PCI Gigabit cards, substituting the other port names.

This setting is retained after a restart and does not need to be entered after each startup.

How to disable Jumbo Frames

If you experience any issues or do not want to use Jumbo Frames, you can change the port back by using this command:

```
sudo networksetup -setMTU en1 1500
```

Then change the JUMBOFRAME line in /etc/hostconfig to:

```
JUMBOFRAME=-NO-
```

After that, restart the computer.
Published Date: Oct 7, 2016

Mac OS X 10.2: How to allow use of unbundled applications with Account Capabilities

This article has been archived and is no longer updated by Apple.

You may not be able to open unbundled applications with an account that is managed by the Capabilities feature. You may notice this when one application cannot open another sub-application, sometimes called "sub-launching." This document explains how to allow unbundled applications.

Note: This advanced procedure requires manual editing of a value in NetInfo Manager. This is provided for information purposes only. Apple does not provide any further technical support or assistance for performing this task. The Capabilities feature is available in Mac OS X 10.2.

About unbundled applications
An "unbundled" application is one that does not have an assigned Type/Creator or Bundle ID. These applications cannot open if you have selected the "Use only these applications" checkbox in the Capabilities pane of Accounts preferences. Some applications may open (or sub-launch) unbundled application utilities to perform certain tasks.

Allowing use of unbundled applications
Using the steps below, you can allow use of unbundled applications while still managing application access.

Part I: Accounts Preferences

1. From the **Apple** menu, choose **System Preferences**.
2. Click the Accounts icon.

Figure 1 Selecting the Accounts pane

3. Click the New User button, and follow the prompts to create a new user.
4. Select the user you just created from the Users list.
5. Click the Capabilities button.
6. Set the Capabilities options as desired.
Note: If your are restricting applications by selecting the "Use only these applications" option, click the Locate button to add support applications to the allowed list.
7. Click OK to save the Capabilities settings.

Part II: NetInfo Manager

1. Open NetInfo Manager (/Applications/Utilities).
2. From the **Security** menu, choose **Authenticate**.
3. Enter your administrator account name and password.
4. Using the columns in NetInfo Manager, navigate to the user that you just created. For example, to edit the user with the short name "grethe", you would go to /users/grethe in the columns.
5. Locate the mcx_settings property, and select its value by double-clicking the field to its right. All of the text should be highlighted.
6. Press Command-C to copy the contents of the mcx_settings property to the Clipboard.

Part III: TextEdit

1. Open TextEdit (/Applications/).
2. If a new, blank document did not appear, create one now. From the **File** menu, choose **New**.
3. From the **Format** menu, choose **Make Plain Text**.
4. Press Command-V to paste the contents of the mcx_settings value into the document.
5. From the **File** menu, choose **Save As**.
6. Name the file: `mcx_settings.org.plist`
7. Save the file to the desktop.
8. Using the Finder, select the file you just saved.
9. From the **File** menu, choose **Duplicate**.
10. Rename the duplicate to: `mcx_settings.plist`
11. Open the mcx_settings.plist file in TextEdit.
12. Locate the "AlwaysAllowedList-Raw" dictionary (<dict>) that is under the mcx_preference_settings domain (highlighted in Figure 1).

Note: If this dictionary is not found, then applications are not being managed for this user. Conversely, there may be multiple instances of

this dictionary. In that case you should only edit the one located under the mcx_preference_settings, as illustrated in Figure 2.

Figure 2 Locating the AlwaysAllowedList-Raw dictionary

13. Add the following text above the AlwaysAllowedList-Raw dictionary (highlighted in figure 3):

```
<key>AllowUnbundledApps</key>
<true/>
```

Figure 3 Adding the AllowUnbundledApps key

14. Save the changes.

Note: You can test the validity of your plist file by trying to open it in the Plist Editor application (installed with the developer tools, also found on the NetBoot for Mac OS 9 CD). If the file does not open in Plist Editor, there may be an issue with how you added the key.

15. From the **Edit** menu, choose **Select All**. (This should select all of the mcx_settings.plist document).
16. Press Command-C to copy the text to the Clipboard.

Part IV: Replacing mcx_settings

1. Go back to the NetInfo Manager application.
2. Paste the text from the Clipboard into the mcx_settings value that you previously selected in NetInfo Manager.

Note: You can use the Up Arrow and Down Arrow keys to scroll down and verify that text was successfully pasted.

3. Save the changes in NetInfo Manager.
4. Confirm the modification by clicking the "Update this copy" button.

Go back to Part II, Step 4 and repeat this process for each account that needs to be able to open unbundled applications.

The accounts you edited will be able use unbundled applications when they next log in.

This document will be updated when more information is available.

Additional information

You may see this issue when using iPhoto, Image Capture, Apple Remote Desktop, or a custom desktop picture. For related information, see these technical documents:

107539: "**Mac OS X Managed Client: Stops Responding During Login When Using Custom Desktop Picture**"
25400: "**iPhoto, Image Capture: Managed Mac OS X Clients May Not Recognize a Camera**"
107410: "**Apple Remote Desktop: Managed Clients Become Unavailable**"

Workgroup Manager: Troubleshooting "A computer with that description already exists" Messages

This article has been archived and is no longer updated by Apple.

When you try to add to a computer list in Workgroup Manager, a message may say the computer already exists in a list.

Symptom

You see one of these alert messages in Workgroup Manager:

> "Unable to save. A computer with that description already exists in this or another list."
>
> "Unable to save. A computer with that address already exists in this or another list."

Solution

LDAPv3 (Mac OS X Server 10.3 or later)

Using Workgroup Manager, manually remove the computer record using the inspector. Follow these steps:

1. Open Workgroup Manager (/Applications/Server).
2. Connect to the directory domain (default: /LDAPv3/127.0.0.1).
3. From the **Workgroup Manager** menu, choose **Preferences**.
4. Select the "Show 'All Records' tab and inspector" checkbox, and save the changes.
5. Click the All Records tab.
6. Click the Options button, and be sure that only these options are selected (you may have to deselect some options):

   Show Standard Attributes
   Show Native Attributes

7. From the pop-up menu, choose **Computer Lists**.
8. Select the Computer List that you were trying to add this computer to.
9. Click the disclosure triangle next to Computers, and you will see a list of computers.
10. Locate the record for the computer you were trying to add. Note: The computer may or may not be in this list. If the computer is in the list, continue to step 11; otherwise skip to step 13.
11. Select the Computer you were trying to add.
12. From the **Server** menu, choose **Delete Selected Records**.
13. Click the disclosure triangle next to "apple-computers", and you will see a list of computers.
14. Locate and select the record for the computer you were trying to add. Note: The computer may or may not be in this list. If the computer is in the list, continue to step 15; otherwise skip to step 17.
15. Select the Computer you were trying to add.
16. From the **Server** menu, choose **Delete Selected Records**.
17. Save the changes.
18. From the pop-up menu, choose **Computers**.
19. Locate and select the record for the computer you were trying to add.
20. From the Server menu, choose 'Delete Selected Records'
21. Save the changes.

You may now add this computer to a list.

Mac OS X Server 10.2 only

Using NetInfo Manager, manually remove the computer record from the /computers directory. Follow these steps:

1. Open NetInfo Manager (/Applications/Utilities)
2. Connect to the directory domain (default: network).
3. From the **Security** menu, choose **Authenticate**.
4. Enter the necessary authentication information.
5. In the NetInfo Manager columns, browse to /computers. You will see a list of computers in this directory.
6. Locate the record for the computer you were trying to add.
7. Delete the record.
8. Save the changes in NetInfo Manager.
9. Confirm the modification by clicking the "Update this copy" button.

You may now add this computer to a list.

Published Date: Oct 7, 2016

Workgroup Manager: Select Local When Browsing Computers to Add to a List

When browsing to add to a computer list in Workgroup Manager, you should select Local in the network dialog. The Local option searches via Bonjour (formerly "Rendezvous").
This article has been archived and is no longer updated by Apple.
When using the browse feature in Workgroup Manager to add to a computer list, a standard Connect to Server dialog appears. Select the Local option, which uses Bonjour to discover client computers on the network.

Clients that display their media access control (MAC) address in the list can be successfully added to the computer list.

Additional information

The search options, such as Local and AppleTalk, that appear in a Connect to Server dialog depend on which services are enabled in Directory Access (/Applications/Utilities). If AppleTalk is enabled, for example, you will see a list of all the available AppleTalk Zones. If SMB is enabled, you will see a list of all the available SMB Workgroups.

You can disable any service that you are not using to reduce the number of directory service choices in a Connect to Server dialog. Services such as AppleTalk, SLP, and SMB can appear in a Connect to Server dialog. Some other services cannot appear in a Connect to Server dialog. These include Active Directory, BSD Configuration Files, LDAPv2, LDAPv3, and NetInfo.

For more information, see technical document 107675, "**Workgroup Manager: Why a MAC Address May Not Appear When Adding to a Computer List**".
Published Date: Feb 17, 2012

Workgroup Manager: Why a MAC Address May Not Appear When Adding to a Computer List

When browsing to add computers in Workgroup Manager, MAC addresses may not appear for some client computers. You cannot add these clients to the computer list.
This article has been archived and is no longer updated by Apple.

Symptom

When using the browse feature in Workgroup Manager to add computers to a computer list, some clients display their Media Access Control (MAC) address, while others do not.

Solution

MAC address information appears for clients that identify themselves via Rendezvous, supplying information such as the MAC address of the built-in Ethernet port and the computer name. You can successfully add these clients to the computer list when browsing.

To see only clients broadcasting via Rendezvous, select the Local option when browsing. This is discussed further in technical document 107674, "**Workgroup Manager: Select Local When Browsing Computers to Add to a List**".

Clients that do not display their MAC address information are using another directory service protocol, such as AppleTalk or SMB. These clients cannot be added to the computer list when browsing.

Additional information

Disabling Rendezvous in Directory Access only prevents the ability to discover services via Rendezvous. It does not prevent broadcast via Rendezvous. This means clients with Rendezvous disabled in Directory Access will still appear in the list when browsing to select a computer.

Apple Remote Desktop: Primary Language on Administrator and Client Computers Must Match

For Apple Remote Desktop to work properly, the most preferred (or "primary") language must be the same for the administrator's user account and a client computer's root account.
This article has been archived and is no longer updated by Apple.
Note: The client computer's primary root account language is the one that was selected in the Mac OS X Setup Assistant. The administrator account's primary language is whichever the administrator has selected for her (non-root) administrator account at any given time. The root account language of the administrator's computer is not a factor.

Individual users of the client computers are still free to choose any language, so long as the client computer's root user language matches the administrator's current choice. Remember to choose the same language on all computers during initial setup.

To change or view the root account's language preference on a client computer that has already been set up, follow these steps:

1. Log in as the root user at the client computer. For help with this step, see technical document 106290, "**Mac OS X: About the root User and How to Enable It**".
2. From the **Apple** menu, choose **System Preferences**.
3. From the **View** menu, choose **International**.
4. Click the Language tab.
5. Drag the most preferred language to the top of the list. In this case, make sure the same language is at the top of the list on both the client and administrator computers.

Mac OS X 10.2: Software Update Command Requires DNS

DNS must be available for the "softwareupdate" command-line tool to work. When there is no DNS service, softwareupdate incorrectly reports that software is already up-to-date.
This article has been archived and is no longer updated by Apple.

Symptom

The softwareupdate tool incorrectly reports that software is up-to-date. This happens when it cannot reach or resolve the target server.

Solution

There are two workarounds to this issue:

- Use Software Update preferences instead of the command-line tool, or
- Change the computer's Network settings to include a working DNS server.

Published Date: Feb 17, 2012

Mac OS X Server 10.2: How to Change Password Server Host to Password Server Client

You can change the status of a server from hosting Password Server service to being a Password Server client.
This article has been archived and is no longer updated by Apple.
To change the status of a server from hosting Password Server service to being a Password Server client:

1. Open the Open Directory Assistant at the server to be changed, which in this example will be called Server 1.
2. In the Security panel, select "stored and accessed locally in user records".
3. Restart Server 1.
4. Open the Open Directory Assistant again at Server 1.
5. In the Directory Use panel, select "get directory information from another system". The parent server from which you intend to get information will be referred to as Server 2 in this example.
6. In the Configure panel, enter information appropriate for your directory configuration.
7. Finish by clicking "Go Ahead".
8. Restart Server 1.
9. To verify that the change has been completed you may wish to log in locally at Server 1 using user information known to exist on Server 2.

Published Date: Feb 17, 2012

Mac OS X Server 10.2: Changing the grade of encryption used with Apache

You can change the grade of encryption used with Apache in Mac OS X Server 10.2. The Cipher Suite directive designates the cryptographic algorithms for data encryption. Examples are DES, IDEA, and RC4.
This article has been archived and is no longer updated by Apple.
To change the grade of encryption used with Apache on Mac OS X Server, follow these steps:

1. Open Terminal (/Applications/Utilities/).
2. Type: `sudo pico /etc/httpd/httpd_macosxserver.conf`
3. Press Return.
4. Enter your administrator password when prompted, and press Return. The httpd_macosxserver.conf file opens in the pico text editor.
5. Review the guidelines at the top of this file. Be sure to follow these when editing.
6. Use the arrow keys to scroll down to the SSLCipherSuite directives. There will be one for each virtual host. By default it looks like this:

```
SSLCipherSuite "RSA:-HIGH:-MEDIUM:-LOW:+EXP"
```

7. Modify this directive as necessary to provide the desired level of encryption. Examples:

- To require strong encryption:

```
SSLCipherSuite HIGH:MEDIUM
```

- To use the default cipher, but remove the no-longer-recommended SSLv2:

```
ALL:!ADH:RC4+RSA:+HIGH:+MEDIUM:+LOW:!SSLv2:+EXP:+eNULL
```

- One way to add stronger encryption would be to change it to the following:

```
SSLCipherSuite "ALL"
```

8. Press Control-O to save the file, and Return to confirm.
9. Press Control-X to exit pico.
10. Restart Apache.

Notes

1. To list the available ciphers, use the "openssl ciphers -v" command, in Terminal.

2. For more information about the SSLCipherSuite directive follow the below web link to the modssl site:

http://www.modssl.org/docs/2.8/ssl_reference.html#ToC9

Mac OS X Server 10.3: Tested and theoretical maximums (limits)

The table below lists the tested and theoretical maximums (limits) for services offered by Mac OS X Server 10.3 or later.

This article has been archived and is no longer updated by Apple.

Note: Tested maximums reflect the test configuration and do not represent a guarantee of performance. Your experience may vary depending on factors such as computer model, microprocessor speed, network conditions, hard disk space, disk fragmentation, installed memory (RAM), client load, total number of services running on the server, or other software used on the server. Information left blank in the table is not yet available.

Tested and Theoretical Maximums

Component	Maximum	Tested	Theoretical
AFP Server	Number of Connected Users	1000	N/A
AFP Server	Shareable Volume Size	16 TB	16 TB
AFP Server	Number of Files per Volume	250 million	2 147 483 646
AFP Server	Number of Shared Items (Share Points)	255	255
BSD Kernel	Number of Processes (Note 1)	2048	
BSD Kernel	Number of Processes per UID (Note 2)	1000	
BSD kernel	Size of Argument	256 KB	256 KB
Core OS	Number of Open Files	1000	12288
Directory Services	Number of Groups	10000	
Directory Services	Number of Users	10000	
Directory Services	Number of Users per Group	10000	
Directory Services	Number of Groups per User	16	16
FTP Server	Number of Connected Users		16384
FTP Server	Number of Connections per User		16384
Macintosh Manager Client	Number of Approved Desktop Printers Per Workgroup	5	10
Mail Server	Number of Incoming SMTP Connections	256	2000
Mail Server	Number of Outgoing SMTP Connections	256	2000
Mail Server	Number of POP Connections	512	2000
Mail Server	Number of IMAP Connections	512	2000
Mail Server	Number of Messages in System (Note 3)	1.5 million	File system maximum
Mail Server	Number of Entries in SMTP Server Rejection List	128	N/A
Mail Server	Number of Entries in Approved SMTP Hosts List	128	N/A
NetBoot	Number of Clients Simultaneously Using NetBoot	50	
Print Server	Number of Queues	60	
QTSS	Number of Connected Users per Streamed File		12288
QTSS	Number of Simultaneously Streamed Files		12288
QTSS	Number of Connected Users		12288
SMB Server	Number of Open Files	1000	12288
SMB Server	Number of Connected Users	1000	1000
User Accounts	User Comments Character Limit	54662	N/A
Web Server	Number of Connected Users		2048
Web Server	Number of Open Files		12288

Notes:

1. For comparison, the maximum is 532 in the standard version of Mac OS X 10.3 Panther.
2. Many applications run with their own UID. For comparison, the maximum is 100 in the standard version of Mac OS X 10.3 Panther.
3. Mail is no longer stored in a database, but rather as a file per message.

Mac OS X Server 10.0 to 10.3: System Requirements

Use of Mac OS X Server requires computer hardware with the amounts of RAM and hard disk space described in this document. Other considerations, as noted, may apply to your setup. This document applies to server versions 10.0.3 and later.
This article has been archived and is no longer updated by Apple.

Computers that can use Mac OS X Server

These computers can use Mac OS X Server versions 10.0.3 to 10.2.8 only:

- Power Macintosh G3 All-In-One
- Power Macintosh G3 Mini Tower
- Power Macintosh G3 Desktop
- Macintosh Server G3

Generally speaking, these computers may use Mac OS X Server versions 10.0.3 or later:

- eMac
- iMac
- Power Macintosh G3 (Blue and White)
- Macintosh Server G3 (Blue and White)
- Power Mac G4
- Macintosh Server G4
- Power Mac G4 Cube
- Power Mac G5
- Xserve

Note that some of these computers require a minimum version, as listed in this table:

Computer Model	Minimum Server Version
Macintosh Server G4 (QuickSilver)	10.0.4
Power Mac G4 (QuickSilver Dual 800 MHz)	10.1
iMac (Flat Panel)	10.1.2, see Note 1
Power Mac G4 (QuickSilver 2002)	10.1.2, see Note 1
eMac	10.1.4, see Note 1
Xserve	10.1.5, see Note 2
iMac (17-inch Flat Panel)	10.1.4, see Note 1
Power Mac G4 (Mirrored Drive Doors)	10.2
Macintosh Server G4 (Mirrored Drive Doors)	10.2.1
Power Mac G4 (FW 800)	10.2.3, see Note 3
iMac (17-inch 1 GHz)	10.2.3, see Note 3
Xserve (Cluster Node)	10.2.4
Xserve (Slot Load)	10.2.4
eMac (ATI Graphics)	10.2.4, see Note 3
Power Mac G4 (MDD 2003)	10.2.6, see Note 3
Power Mac G5	10.3

Important: Only the listed computers meet the system requirements for Mac OS X Server. Apple provides technical support **only** for hardware-software combinations that appear on this list. Power Mac G5 computers cannot be used with Mac OS X Server 10.2.8 or earlier.

Notes

1. For installation instructions, see technical document 106699,"**Mac OS X Server 10.1: How to Install on Power Mac G4 (QuickSilver 2002) or iMac (Flat Panel) Computer**".
2. Mac OS X Server 10.1.5 was only available when bundled with some earlier Xserve computers. Users of Mac OS X Server 10.1.5 should upgrade to 10.2 or later.
3. For installation instructions, see technical document 107496, "**Mac OS X Server 10.2.3: How to Install on Power Mac G4 (FW 800) or eMac (ATI Graphics)**".

Use on Unsupported Computers

Because software developers sometimes must use older computers with developer releases or need to demonstrate their software using PowerBook computers, Apple has allowed for Mac OS X Server to be installed on certain unsupported computers. Services are only qualified for use on the supported computers listed above by version. If you use Mac OS X Server in an unsupported configuration in a production server environment, performance, reliability, and functionality may all be significantly degraded.

Memory (RAM)

- 128 MB

Note: This is the minimum amount of RAM required. More RAM may be required for certain services, to support a large number of clients, or for best performance.

Hard disk space

- 4 GB

Note: This is the minimum amount of available disk space required. More available disk space may be required for certain services, to support a large number of clients, or for best performance.

Mac OS X Server: NetBoot Capable Computers

Find out which computers can be used as NetBoot clients.
This article has been archived and is no longer updated by Apple.

NetBoot capable computers

These computers may be used as NetBoot clients. Server versions 10.0.3 to 10.2.8 offer both NetBoot 1 and NetBoot 2, which adds DHCP during NetBoot. With exception of certain older models listed in the next section, the listed computers can use NetBoot 1 or NetBoot 2.

- eMac (all models)
- iBook (all models)
- iMac (all models)
- Macintosh Server G3 (Blue and White)
- Power Macintosh G3 (Blue and White)
- Power Mac G4 (all models)
- Macintosh Server G4 (all models)
- Power Mac G4 Cube (all models)
- Power Mac G5
- PowerBook ("Bronze Keyboard" and later models)

Note: Some computers require a firmware update to use NetBoot 2. Use the Software Update feature to be sure your firmware is up to date.

Computers not capable of NetBoot 2

Certain models of NetBoot 1- capable computers are not capable of NetBoot 2. This section describes those.

- iBook (see Note)
- iMac (models with tray-loading optical drives)
- Macintosh Server G3 (Blue and White)
- Power Macintosh G3 (Blue and White)
- Power Mac G4 (PCI Graphics)
- PowerBook G3 (Bronze Keyboard)

Note: This refers to variations of the original iBook that were released prior to iBook (Dual USB). Some versions of the original iBook are NetBoot 2 capable, and others are not. If an original iBook will accept firmware update 4.1.7 or later, then it is NetBoot 2 capable.

Mac OS X Server 10.1, 10.2: Network Settings for Ethernet Port Are Incorrect After Using Setup Assistant

After using the Server Assistant, a port may be misconfigured with IP information intended for a different port.
This article has been archived and is no longer updated by Apple.

Symptom

Network settings entered in the setup assistant appear on the wrong port.

This does not affect the built-in Ethernet port. It occurs when the computer has AirPort or an additional PCI Ethernet card, or if the computer is capable of IP over FireWire.

Solution

Use Network preferences to correct the settings.
Published Date: Feb 17, 2012

Mac OS X Server 10.3: Server Setup Assistant Doesn‘t Work When Date and Time Are Wrong

Server Assistant only works when the date and time settings are correct.
This article has been archived and is no longer updated by Apple.

Symptom

Server Assistant does not allow you to continue.

Solution

Prior to installing Mac OS X Server, be sure that that server's date and time settings are correct in Date & Time preferences.

You can set the clock in single-user mode if you need to. For information on single-user mode, see document 106388, "**Mac OS X: How to Start up in Single-User or Verbose Mode**".

Follow these steps:

1. Type: `mount -uw /`
2. Press Return.
3. Type: `date +0307210800`
   Note: In this example, the date is 2003-07-21, 8:00 A.M. Using that format, insert values that are current. Time must be entered in 24-hour format.
4. Press Return.
5. Type: `sync`
6. Press Return.
7. Type: `sync`
8. Press Return.
9. Type: `reboot`
10. Press Return.

Published Date: Oct 7, 2016

Mac OS X Server 10.2: NetBoot Clients Stop Responding During Startup Due to Image Creation Issue

If you create a NetBoot or Network Installation image while serving active NetBoot clients from the same server, clients may subsequently stop resounding ("hang" or "freeze") during startup or network installation.
This article has been archived and is no longer updated by Apple.

Symptom

NetBoot clients do not start up successfully. A computer may stop responding at a blue screen, or a kernel panic may occur. You may notice other unexpected behavior.

Solution

First, try restarting the affected clients. If that is not successful, create your NetBoot or Network Installation images during off-peak hours when clients are least likely to be using the service.
Published Date: Feb 17, 2012

Power Mac G5: Stops Responding During Login As a NetBoot Client

A Power Mac G5 NetBoot client may stop responding ("hang" or "freeze") during login. A workaround is to resize the NetBoot image, as described in this document.
This article has been archived and is no longer updated by Apple.

Symptom

When a user tries to log in, the Power Mac G5 NetBoot client stops responding.

This usually affects NetBoot images that were created using the Network Image Utility in Mac OS X Server. NetBoot images created from existing systems are usually not affected.

Solution

1. At the server, log in as the root user. For help with this step, see technical document 106290, "Mac OS X: About the root User and How to Enable It".
2. In Server Settings, stop the NetBoot service.
3. Unlock the NetBoot image.
4. Open Disk Copy and use it to resize the NetBoot image, adding about 100 MB.
5. Start the NetBoot service in Server Settings.

Note: This issue does not occur in Mac OS X Server 10.3 or later.
Published Date: Oct 7, 2016

Mac OS X Server 10.3, 10.4: NetBoot images over 2 GB cause kernel panic when served via HTTP

If a NetBoot image larger than 2 GB is served over HTTP, the NetBoot client may stop responding ("hang" or "freeze").

This article has been archived and is no longer updated by Apple.

Symptom

Clients experience kernel panic when using a NetBoot image served via HTTP.

Because the same image may work normally when served via NFS, this issue is especially notable when changing an image from NFS to HTTP.

Solution

Use either of these workarounds:

- Use NFS to serve images larger than 2 Gb.
- Compress the image. If the compressed image is 2 Gb or smaller, you can serve it via HTTP.

Published Date: Oct 7, 2016

Mac OS X Server 10.3: Can‘t add a third-party package to NetBoot image

Learn how to add a third-party (non-Apple) package to a NetBoot image.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to add a package to the NetBoot image, Network Image Utility issues these alert messages:

> "There was an error creating the image."
> "Disabled volume <VolumeName> because there is not enough free space."

Solution

When adding non-Apple pkgs or custom-created pkgs, take one of these actions:

- Make sure the pkg has the IFPkgFlagInstalledSize set in the Info.plist, or
- Stretch the image and try adding the pkg later.

Published Date: Oct 7, 2016

Mac OS X Server 10.3: Additional LDAP configuration parameters

Here you can learn about two LDAPv3 plugin parameters that are not documented in the Open Directory administration guide.
This article has been archived and is no longer updated by Apple.
These two parameters are in (or can be added to) the server's LDAP configuration file (/library/preferences/directoryservice/DSLDAPv3PlugInConfig.plist).

Delay Rebind
The parameter takes this form:

```
<key>Delay Rebind Try in seconds<\\key>
<integer>n<\\integer>
```

This parameter should be located near "<key>OpenClose Timeout in seconds<\\key>".

The value "n" specifies how long the LDAP plugin waits before trying to reconnect to a server that fails to respond. You can increase this value to prevent continuous reconnection attempts.

Idle Timeout
The parameter takes this form:

```
<key>Idle Timeout in minutes<\\key>
<integer>n<\\integer>
```

If this parameter is not already in the file, add it near "<key>OpenClose Timeout in seconds<\\key>".

This setting specifies how long the LDAP plugin will sit idle before disconnecting from the server. You can adjust this value to reduce overloading the server's connections from remote clients.

Related document

If you need help modifying a configuration file, see technical document 106619, "**Mac OS X Server: How to Locate and Edit Configuration Files**".
Published Date: Oct 7, 2016

Mac OS X Server 10.3: About disk quotas, home directory disk quotas, and BSD quotas

Learn about the different ways quotas can be used on Mac OS X Server 10.3 volumes and directories. You can implement one type of quota or a combination, depending on your needs.
This article has been archived and is no longer updated by Apple.

Soft and Hard quotas--the differences

"Soft" Disk Quotas - User accounts have a fixed amount of disk space in their Documents folder. This disk space can be used for any purpose. Soft Quotas allow users to exceed the defined disk quota in order to save a single file. However, users are subsequently prevented from saving additional files. Note that neither the user nor the administrator has an interface for viewing the status of soft quotas.

"Hard" Disk Quota - This feature prevents users from exceeding their defined quotas. A hard quota does not allow a file that would exceed the quota to be saved. When using AFP, the hard quota is represented to the user as available space remaining on the volume.

Setting quotas with Workgroup Manager

Worgroup Manager allows you to set hard quotas for user home directories. In the Sharing pane of Workgroup Manager, there is an option to enable quotas on a given volume. You must select this for the home directory share point(s) prior to setting home directory quotas for specific users. Next, you can use the "disk quota" setting in the User Home pane to regulate the disk usage of a particular user's home directory on a volume.

AFP applies quotas to the file system when a user with a home directory quota logs in. Quota limits always apply to the entire volume. In the case of home directories, the quota will apply to any files saved or owned by the user within the volume the homes are shared from.

For example: If an administrator were to share both a group folder and home directories from the same server partition, enable quotas for that partition, and set a quota for a user who had a home directory in that share point, then the quota would apply to files owned by the user in both her home directory and group folder.

Setting quotas in Terminal

You can use the "edquota" command in Terminal to set quotas for users and groups outside the scope of quotas set in Workgroup Manager. For example: You could use this tool to set quotas for any user or group volumes that are not home directories.

If you make any settings that overlap with Workgroup Manager, Workgroup Manager will override edquota.

Usage of the edquota command is documented in its man page (execute "man edquota" in Terminal to see it). You should be proficient in command line usage before using the command. See also the man pages for repquota, quotaon, and quotaoff.

Note: Apple does not provide any free-of-charge technical support for use of these commands.

For more information on Disk Quotas, see the Mac OS X Server 10.3 User Management Administration Guide
Published Date: Oct 7, 2016

Mac OS X Server 10.3 or later: Kerberos authentication may not work after changing to LDAP master or replica, or Kerberizing a particular service

If you change your server LDAP directory configuration to Master or Replica, or if you re-Kerberize a service, the creation of duplicate keytab files may cause Kerberos authentication to stop working in some cases. Deleting older keytab files resolves the issue.
This article has been archived and is no longer updated by Apple.

Symptom

Kerberos authentication no longer works.

Products Affected

- Mac OS X Server 10.3 or later

Solution

There are normally three keys within the keytab file per kerberized service. If there are duplicate sets of keys, execute the following commands in Terminal. Commands are preceded by the number sign (#).

To examine the keytab file:

```
# sudo ktutil
```

At the ktutil prompt:

```
ktutil: read_kt /etc/krb5.keytab
ktutil: list
ktutil: exit
```

If duplicate keys exist or Kerberos authentication is no longer working, remove the keytab file with this command:

```
#sudo rm /etc/krb5.keytab
```

Then recreate the keytab file with this command:

```
#sudo sso_util configure -r KERB-REALM -a LDAP-ADMIN -p LDAP-ADMIN-PASSWORD all
```

The new keytab file should allow kerberized services to authenticate correctly.

Note: The "LDAP-ADMIN" mentioned above represents the user (or administrator) created on the master LDAP server in Server Assistant during initial server setup. This step may fail if the root user is used.
Published Date: Oct 7, 2016

Mac OS X 10.3: Some Zones, Workgroups, or SLP Scopes Don‘t Appear When Browsing Network

Sometimes, you can't see all AppleTalk Zones, Windows Workgroups, Windows Domains, or SLP Scopes in the Network Browser. If some devices appear and others don't, the missing ones may have duplicate names.
This article has been archived and is no longer updated by Apple.

Symptom

Some network resources appear in the zone list, but others you expect do not appear.

Products Affected

- Mac OS X 10.3 to 10.3.2

Solution

Update to 10.3.3 or later.
Published Date: Oct 7, 2016

Mac OS X 10.3: Slows or Stops Responding While Using VISE Installer

Your computer may slow down or stop responding when you install software that uses the VISE Installer.
This article has been archived and is no longer updated by Apple.

Symptom

When you install software, the computer slows down or stops responding ("crashes", or "freezes").

This can happen if the software you're installing uses the VISE installer and you've connected to a server volume, such as your iDisk.

Many software publishers use VISE to install their products. You can normally tell you are using VISE by a VISE-specific icon for the installer, a reference to VISE in the installer splash screen, or mention of VISE in some other part of the installer.

Note: This issue affects all remote volumes other than AFP volumes. This includes WebDAV, SMB, and NFS volumes.

Solution

Before you install any software, disconnect from remote volumes, such as your iDisk, before opening the installer application.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Mac OS X 10.3: About Sleep and Windows File Sharing (SMB)

After your computer wakes from sleep, shared disks (or "shares") from a Microsoft Windows computer or other Windows File Sharing (SMB) server may not be available.
This article has been archived and is no longer updated by Apple.
If a Windows shared disk is no longer available after sleep, reconnect to the server.

To prevent this from occurring, avoid putting the computer to sleep while SMB shared disks are mounted, especially when using an SMB-based home directory. The computer will not go to sleep automatically while SMB shared disks are mounted, but it can still be put to sleep manually (from the Apple menu or by closing the display on a portable computer).

Warning: You may lose unsaved changes to documents stored on the shared disk when your computer goes to sleep. Either always save your work or do not put the computer to sleep to prevent this from happening.

Published Date: Oct 7, 2016

Mac OS X 10.3 or later: Can‘t connect via PPTP with some Internet service providers

PPTP login attempts may fail when using certain Internet service providers. PPTP is the point-to-point tunneling protocol, which may be used as part of a virtual private network (VPN).
This article has been archived and is no longer updated by Apple.

Symptom

Your attempt to authenticate (or log in) fails, even when you are certain that your name and password are correct.

An entry similar to this one will appear in the connection log, but with IP address and time code information that matches your situation:

```
Mon Aug  4 20:56:02 2003 : acsp check options
Mon Aug  4 20:56:02 2003 : PPTP connecting to server '169..192.1.253' (169.192.1.253)...
Mon Aug  4 20:56:02 2003 : PPTP connection established.
Mon Aug  4 20:56:03 2003 : Using interface ppp0
Mon Aug  4 20:56:03 2003 : Connect: ppp0 <--> socket[34:17]
Mon Aug  4 20:56:03 2003 : MPPE required, but MS-CHAP[v2] auth not performed.
Mon Aug  4 20:56:03 2003 : Connection terminated.
Mon Aug  4 20:56:03 2003 : PPTP disconnecting...
Mon Aug  4 20:56:03 2003 : PPTP disconnected
```

Solution

First, be sure you have updated to Mac OS X 10.3.4 or later.

Follow these steps:

1. Open Internet Connect.
2. Click VPN (PPTP).
3. From the **Configuration** pop-up menu, choose **Edit Configuration**.
4. From the **Encryption** pop-up menu, choose **None**.

Notes

- The change is persistent.
- This PPTP connection must be used only to connect to the ISP for which you configured it.
- If you need an additional VPN PPTP connection, you must create a new one using Internet Connect.

Published Date: Oct 7, 2016

Mac OS X Server 10.3: Delaying an automatic restart

You can time delay the automatic restart feature of your server. Some peripheral devices require this extra time to initialize and become accessible after a power failure.
This article has been archived and is no longer updated by Apple.
You can set the time delay by using the "systemsetup" command. Follow these steps:

1. Open Terminal (/Applications/Utilities/).
2. Type: `sudo systemsetup -setWaitForStartupAfterPowerFailure seconds`

   Note: Replace "seconds" with the delay time in multiples of 30 seconds. For example, to allow a five-minute delay, type:

   sudo systemsetup -setWaitForStartupAfterPowerFailure 300

3. Press Return.
4. Enter your administrator password when prompted, and press Return.

Example scenarios

These two examples illustrate when this feature might be required.

- Your Xserve RAID requires a minute to become available, so you set the Xserve restart delay to two minutes. The RAID is up and ready to go by the time the Xserve starts up.
- You have a large number of servers relative to your electrical circuit's capacity. To reduce load on the circuit, you decide to stagger the startup time of the servers so that they start up over several minutes.

Published Date: Oct 7, 2016

Mac OS X 10.3: IP address conflict not resolved when connected to a switch

An IP address conflict may not be resolved during startup if your computer is connected to a switch. You can avoid the issue by changing a configuration file.
This article has been archived and is no longer updated by Apple.
This happens if your computer takes an IP address that is being used by another computer. After the duplicate address is identified, one or both computers shut down their network interfaces. You may see a message explaining what happened.

This can happen in either Mac OS X or Mac OS X Server version 10.3 or later.

Tip: A switch is a more sophisticated type of Ethernet hub. This document only applies if you are using one. If you are on a large network, ask your administrator if you are using a switch.

To resolve the issue:

During startup, Mac OS X sends four ARP probes to determine whether a duplicate IP address exists on the network. Four is not enough when using certain switches. To solve the issue, increase the number of ARP probes sent at startup by editing a configuration file.

Important: The following steps describe an advanced technique using the command line in Terminal. Review the instructions before you begin. If you are not comfortable following these instructions, you should seek assistance. Inappropriate changes to the configuration file could prevent system features from working properly.

Follow these steps:

1. Open Terminal (/Applications/Utilities/).
2. Type: `sudo pico /System/Library/SystemConfiguration/IPConfiguration.bundle/Resources/IPConfiguration.xml`
3. Press Return.
4. Enter your administrator password when prompted, and press Return.
5. Use the arrow keys to scroll to these lines:

```
<key>ARPProbeCount</key>
<integer>4</integer>
```

6. Change the integer value (4) to 15 or more.
7. Press Control-O to save the file, and press Return to confirm.
8. Press Control-X to exit pico.

Note: Increasing the number of ARP probes at startup increases the amount of time the computer takes to start up.
Published Date: Oct 7, 2016

Mac OS X 10.3: Firewall Unavailable After Upgrade Installation

The Mac OS X firewall may no longer be available if you perform an upgrade installation of Mac OS X Panther. An "upgrade" installation is when you install version 10.3 over an earlier version, such as 10.2.8, without first erasing the disk.
This article has been archived and is no longer updated by Apple.

Symptom

Firewall is no longer available in Sharing preferences. When you look there, you may see this message:

> "Other firewall software is running on your computer. To change the Apple firewall settings, turn off the other firewall software."

The status may say "Firewall Unavailable," and the Start button may be dimmed.

Solution

This happens if both printer sharing and the firewall were turned on in Mac OS X 10.2. Download and install Mac OS X 10.3.2 or later.

If you're not ready to update, follow these steps to resolve the issue:

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Go to Folder**.
3. Type: /Library/Preferences/
4. Click Go.
5. Locate this file: com.apple.sharing.firewall.plist
6. Drag this file to the Trash (see Note).
7. From the **Apple** menu, choose **Restart**.

Note: This step removes any custom port settings you have made to the firewall. If you previously opened any ports, you will need to do so again. If you do not want to lose your custom settings, use the Advanced solution below.

Advanced solution

You can use this solution to avoid losing your custom settings, but you must be comfortable with editing a text file in Terminal. Follow these steps:

1. Open Terminal (/Applications/Utilities/).
2. Type: sudo pico /Library/Preferences/com.apple.sharing.firewall.plist
3. Press Return.
4. Enter your administrator password when prompted, and press Return.
5. Using the arrow keys, scroll down to these two lines:

```
<key>allports</key>
<array>
```

6. Directly under "<array>", add a new line containing this text:

```
    <string>515</string>
```

7. Press Control-O to save the file, and Return to confirm.
8. Press Control-X to exit pico.
9. Restart the computer.

Published Date: Oct 7, 2016

Mac OS X 10.3: Windows File Sharing (SMB) Users Can‘t Connect After Upgrade

Learn what to do if Windows File Sharing (SMB) clients can't connect to your computer after you upgraded to Mac OS X Panther.
This article has been archived and is no longer updated by Apple.

Symptom

Windows File Sharing (SMB) clients can't connect to your computer.

Products Affected

- Mac OS X 10.3
- Windows File Sharing (SMB)

Solution

1. From the Apple menu, choose System Preferences.
2. From the View menu, choose Accounts.
3. Click the icon for an account that can't log in.
4. Change that account's password.
5. Repeat steps 3 and 4 for any account that uses Windows File Sharing.

Published Date: Oct 7, 2016

AirPort: Update your firmware to use WPA and WDS together

To use Wi-Fi Protected Access (WPA) and Wireless Distribution System (WDS) at the same time, be sure your AirPort Express or AirPort Extreme has the latest firmware. WPA and WDS can't be used together with earlier firmware versions.

This article has been archived and is no longer updated by Apple.

Note: To review the requirements for joining a WPA network, see document **107795**. Only AirPort Extreme and AirPort Express can host a WPA or WDS network. Earlier AirPort base stations cannot. All AirPort base stations can use WEP.

Safari 1.1: Safari Quits Unexpectedly When PithHelmet Is Installed

If you have installed PithHelmet software on Mac OS X Panther, Safari may unexpectedly quit when opened.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to open Safari on Panther, its icon bounces in the Dock as if it's going to open, but it doesn't. An alert appears instead.

Solution

PithHelmet version 0.7.1 is compatible with Mac OS X 10.2.8 or earlier. See the developer's website for information on a Panther-compatible release.

You can resolve the issue by removing the PithHelmet "SIMBL" file, which will disable PithHelmet but allow Safari to work.

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Go to Folder**.
3. Type: `~/Library/Application Support`
4. Click Go.
5. Search this folder for a file named "SIMBL".
6. If present, drag it to the Desktop.
7. Try to open Safari again.

If this does not resolve the issue, the issue may not be related to PithHelmet. Review the troubleshooting in technical document 107567, "**Safari: Unexpectedly Quits**."

AOL Internet access requires an update when using AirPort

You may not be able to access websites using your AOL account, even if you still get email. An AOL update can get you back on the web.
This article has been archived and is no longer updated by Apple.
This happens when using:

- AirPort or AirPort Extreme Base Station
- Mac OS X 10.3 or later
- AOL dial-up or DSL account

First, be sure you have AOL software v.10.3 (revision 4136.208) or later:

Then use the AOL keyword "MacAirportFix", and install the AOL update the keyword takes you to.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Remote Desktop: Package Installation Does Not Finish

When using the Remote Desktop package installation feature with Mac OS X 10.3 clients, package installations do not appear to be completed.

This article has been archived and is no longer updated by Apple.

Symptom

The installation of the package itself is completed, but the installation process does not exit.

Solution

You should update to **Apple Remote Desktop 1.2.4** to avoid this issue in the future. If you are currently experiencing this issue, you need to follow these steps before updating:

1. At the client, open Activity Monitor (/Applications/Utilities).
2. From the **Monitor** menu, choose **Show Activity Monitor**.
3. Choose **All Processes** from the **Show** pop-up menu.
4. In the Filter field, type: `installer`

   If the installer process is present (Figure 1), the installation process has not yet completed. Continue to step 5 after the installer process completes (it will disappear from the list in Activity Monitor).

   Figure 1 Installer Process still running

5. In the Filter field, type: `ARD`

   Figure 2 ARD Agent Process

6. Select the process named ARD Agent.
7. Click the Quit Process button in the toolbar.
8. When asked if you're sure you want to quit the process, click Force Quit.

The ARD Agent process will then disappear and reappear a few moments later. Once it reappears, the client will report the correct status in Remote Desktop Admin.

Note: The steps above must be done at the affected clients because you can't use ARD to control an affected client in this situation. If Remote Login is enabled on the client, you may also connect to the affected computer with ssh and use top or ps to see if the installer process is still running. Once the installer process has quit, use the following command to kill the ARD Agent process:

```
sudo kill `cat /var/run/ARD.pid`
```

Note: The quote marks are back quotes, not straight quotes. The back quote character is found on the same key as the tilde (~) on the keyboard.

Mac OS X Server: About the Mac OS X Server 10.3.1 Update

This software updates Mac OS X Server 10.3 to 10.3.1.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
2. To install Mac OS X Server 10.3.1, you must enter the password for an administrator account. The password cannot contain a space, or special characters typed by pressing the Option key. If you need to change an administrator account password, use Accounts preferences.
3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X Server 10.3.1.

Software Update

You may have been referred to this document by Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from **Apple Software Downloads**.

Enhancements delivered with this update

This update delivers the enhancements outlined below. This installer is server-specific, but resolves issues found in both the client and server versions of the operating system.

FireWire

- Apple has identified an issue with external FireWire hard drives using the Oxford 922 bridge chipset with firmware version 1.02 that can result in the loss of data stored on the drive. Even with the improvements available in this update, Apple recommends you update the firmware on your FireWire drive. Contact the drive's manufacturer for more information.

Core OS

- Resolves an issue in which FileVault users can potentially lose their home directory settings.
- Addresses issues you may experience with USB printers after upgrading to Mac OS X 10.3 or Mac OS X Server 10.3.

Web Server (WebDAV)

- Addresses issue in which Mac OS X 10.3 or Mac OS X Server 10.3 users may not be able to browse iDisk contents or otherwise connect to a WebDAV server.
- Addresses a potential issue in which files appear to copy successfully to a WebDAV server, but do not appear in the folder and are not on the server volume.

Mac OS X Server: About the Mac OS X Server 10.3.2 Update

This software updates Mac OS X Server 10.3 or 10.3.1 to version 10.3.2.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

- You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
- To install Mac OS X Server 10.3.1, you must enter the password for an administrator account. The password cannot contain a space, or special characters typed by pressing the Option key. If you need to change an administrator account password, use Accounts preferences.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X Server 10.3.2.

Software Update

You may have been referred to this document by Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

An installer is also available from **Apple Software Downloads**.

Enhancements delivered with this update

This update delivers the enhancements outlined below.

Open Directory / Password Server

- Resolves a Directory Access plug-in issue in which attributes received from an Active Directory Windows 2003 server, such as user "Name" and "Realname", do not propagate to a client computer.
- Can join an Active Directory domain when server names in DNS entries have uppercase and lowercase characters. For example: SERVER1x.mydomain.com
- SMB Directory Services plug-in now defaults to other Local Master Browsers (LMB's) when primary LMB is not available, providing a more reliable SMB network browsing experience.
- SMB servers are more readily detectable when browsing the network with a Mac OS X 10.3.2 client.

File Services

- Resolves an issue in which searching a remote AFP volume finds files outside of a share point being searched.
- Provides ability for a Mac OS X 10.3 AFP client to connect to a Mac OS X 10.2 Server using Kerberos.
- Improved responsiveness of NFS from client when attempting to access NFS mounts immediately after startup. (When using previous versions of Mac OS X 10.3, attempting to access NFS-mounted volumes immediately after startup would result in the alert message "Permission Denied".)
- WebDAV file system supports use of Apache virtual host names.

Administration

- Includes enhanced Server Admin and Workgroup Manager applications.
- Includes improved Network Image Utility and QTSS Publisher applications.
- Increases speed of importing of user records.

Other

- Improves printing to PostScript printers.
- Includes FileVault, FireWire 800, WebDAV and USB Printing improvements from Update 10.3.1.
- Includes previous standalone security updates.
- Updates MySQL to version 4.0.16.

Mac OS X Server 10.3: Mobile accounts feature does not copy home directory contents

The Mobile Accounts feature synchronizes account data between a network and a local (mobile) user account. Items such as account name, password, and managed preferences are synchronized, but not other user data such as Documents, Pictures, or Preferences.
This article has been archived and is no longer updated by Apple.
Synchronization of account data, such as name, password, and managed preferences, allows network users to log in while the computer is away from the Directory Service server.

The Mobile Accounts feature is not intended to synchronize the entire contents of a user's home directory.

Java 1.4.2: JBoss and Tomcat Do Not Start After Installing Java 1.4.2 Update

Find out what to do if JBoss and Tomcat do not start after installing the Java 1.4.2 update.

This article has been archived and is no longer updated by Apple.

The run.conf script for starting the JBoss server has a hardcoded reference to the 1.4.1 JVM. Installing the Java 1.4.2 Update removes the Java 1.4.1 installation, and JBoss/Tomcat services will not be able to start. Neither the Server Manager application nor Console will indicate why the service cannot start.

Solution for Mac OS X Server

A JBoss/Tomcat software update is available for Panther server. It installs a new /Library/JBoss/3.2/bin/run.conf file. The original file will be renamed to run.conf.applesaved. It is up to the administrator to merge any customizations back into the new run.conf file.

Solution for Mac OS X (client)

If you have optionally installed the ApplicationsServersDev.pkg from the Developer Tools CD, just update the reference.

The reference below should be changed in the file: /Library/JBoss/3.2/bin/run.conf

```
JAVA=/System/Library/Frameworks/JavaVM.framework/Versions/1.4.1/Home/bin/java
```

to

```
JAVA=/usr/bin/java
```

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Bluetooth: About Encrypted Communication (Key Icon)

Some Bluetooth devices can encrypt data exchanged with your computer. This helps prevent eavesdropping.
This article has been archived and is no longer updated by Apple.
Some devices allow you to encrypt the data that is exchanged with your computer. Encrypted communication makes it more difficult for others to eavesdrop on the information exchanged between your computer and the Bluetooth device. When you pair such a device with your computer, you may be prompted to create a passkey. Some devices automatically generate a random passkey.

When a paired device uses encrypted communication, its icon in the device list of Bluetooth preferences looks like a key (Figure 1).

Figure 1 A paired device with encrypted communication.

For a list of other Bluetooth icons, see technical document 107679, "**Bluetooth: About Bluetooth Icons**".
Published Date: Oct 7, 2016

Bluetooth: About Favorite Devices (Heart Icon)

You can set a "Favorite" device to automatically re-pair with your computer.
This article has been archived and is no longer updated by Apple.
Your computer may lose the connection to a paired Bluetooth device if you temporarily move it out of range, turn it off, or if it has low batteries. By making the device a Favorite in Bluetooth preferences, it will automatically re-pair with the computer as soon as it is back in range or turned on again.

You can set Favorites in Bluetooth preferences. Select a device from the device list, then click the Add to Favorites button. Favorites appear with a heart icon (Figure 1).

Figure 1 A Favorite paired device

For a list of other Bluetooth icons, see technical document 107679, "**Bluetooth: About Bluetooth Icons**".

Apple Remote Desktop: Preference Pane Missing From System Preferences

The Remote Desktop preference pane may not appear for all Mac OS X 10.2 user accounts. Learn how to resolve this issue.
This article has been archived and is no longer updated by Apple.

Symptom

The Remote Desktop preference pane may or may not appear, depending on which user account is logged in to the computer.

Solution

The Remote Desktop preference pane may not appear for users accounts created prior to installing the application. It may appear only for users whose accounts were created after Remote Desktop was installed. You can resolve this on a per-account basis by following these steps:

1. Log in with the affected account.
2. From the **Go** menu, choose **Go to Folder**.
3. Type: `~/Library/Caches`
4. Click Go.
5. Drag the file named "com.apple.preferencepanes.cache" to the Trash.

The Remote Desktop preference pane should appear the next time you open System Preferences.

If the issue persists after deleting the appropriate cache file, troubleshoot following the suggestions in document 25398, "**Mac OS X: How to Troubleshoot a Software Issue**".
Published Date: Oct 7, 2016

Mac OS X: Get Info Comments May Not Appear for Remote Volumes

When you add or edit a Get Info comment for an item on a server volume, the change is not visible to other clients or at the server itself.
This article has been archived and is no longer updated by Apple.
Mac OS X treats comments as a Finder property, such as icon position and view setting. Writing of these properties is local, which means your changes are not saved back to the server. Thus someone connecting to the server from a different computer may not see the Get Info comments you add to an item on the server from another remote client of the server.

For a comment to be visible to all clients, it may be changed at the server itself (see Note 2).

Notes

1. Comment changes do not appear to clients immediately, but they will eventually.
2. Copying a folder to the server yields a different result than editing an existing file or folder. Comments for that folder and items within it will be transferred when you copy it. If you must modify a comment on the server from a client, a user with adequate privileges may do so in this manner.

Mac OS X 10.3.2: Menu Bar Items Blink On and Off

When you are using certain languages, connecting to an AFP server may cause your menu bar items to blink (disappear and reappear every few seconds).
This article has been archived and is no longer updated by Apple.

Symptom

Menu bar items blink, such as the clock, AirPort menu, Input menu (flag), and Volume menu.

If Crash Logging is enabled, a log for "SystemUIServer" is generated each time the menu extras disappear.

Note: The Apple Filing Protocol (AFP) is known by service names such as Apple File Service, AppleShare, and Personal File Sharing. It may be offered by Apple or third-party operating systems.

Solution

Update to Mac OS X 10.3.3 or later.

Additional information

The menu bar items will stop blinking when you eject, or disconnect, the AFP server.

This happens when certain languages are selected as the primary language in International preferences. The affected languages use Cyrillic, Greek, Central European, or Modified Roman characters. These languages are:

- Belarusian
- Bulgarian
- Czech
- Croatian
- Hungarian
- Icelandic
- Greek
- Kirghiz
- Kazakh
- Latvian
- Lithuanian
- Macedonian
- Polish
- Romanian
- Russian
- Serbian
- Slovakian
- Slovenian
- Tatar
- Tajiki
- Turkish
- Turkmen
- Ukrainian
- Uzbek

DVD Studio Pro 2.0.3: Scale Issue With Still Images in PAL Projects

Still menus, slideshows, or tracks containing stills do not have the correct scale in PAL projects.

This article has been archived and is no longer updated by Apple.

Symptom

A PAL project containing still images appears to be scaled correctly when played back from the Simulator, but it is not scaled correctly when played back from the Apple DVD Player or Hardware DVD Players.

NTSC projects are not affected by this issue.

Solution

The DVD Studio Pro 2.0.4 Update addresses this issue. You can download it from Software Update preferences, or from the DVD Studio Pro website (http://www.apple.com/dvdstudiopro/).

Published Date: Oct 7, 2016

WebObjects 5.2.2: Moving Projects From Project Builder to Xcode

Learn how to update a WebObjects 5.x application developed with Project Builder on Mac OS X to Xcode.
This article has been archived and is no longer updated by Apple.
When you use Xcode to open a WebObjects 5.x application developed with Project Builder on Mac OS X, the upgrade process may fail if the main aggregate target name of the project does not match the project name.

To avoid build errors, make sure the main target name matches the project name. If there is a mismatch, rename the target before doing a build.

1. Open the WebObjects application with Xcode, and select Targets.
2. Option-click the target name, and edit it accordingly.
3. From Xcode's **File** menu, choose **Close Project**.
4. Re-open the same project again in Xcode.

The build should now work.

Note: For the change to take effect, it is very important to perform steps 3 and 4.

Important: Projects created with Xcode and WebObjects 5.2.2 cannot be opened with the legacy Project Builder for Mac OS X 10.2.

Safari: You Can‘t Open RealOne Player Content

Safari may not be able to open RealOne Player links if the player is saved on the desktop, or was installed by someone who is using FileVault to protect her account.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to open a RealOne Player link or file, a message appears that says the alias cannot be resolved. An authentication dialog to open another account's home directory may also appear.

Solution

When you install RealOne Player, it downloads as a compressed application. If a FileVault user leaves that application on her desktop, it may be unavailable to other accounts.

Put the RealOne Player application in the Applications folder so all accounts can use it.

1. Log in using the account that installed RealOne Player (see Note).
2. Drag the RealOne Player application to the Applications folder.
3. Open RealOne Player once after moving it. This creates links to its new location.

RealOne content should now work as expected.

Note: If you don't have an administrator account, you cannot move the RealOne Player to the Applications folder. Instead, move it to the Shared folder (/Users/Shared), and ask a user with an administrator account to move it to the Applications folder.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Remote Desktop 1.2.1 to 1.2.4: How to Configure Remotely via Command Line (kickstart)

Learn about the command line utility named "kickstart," which you can use to configure Apple Remote Desktop.

Note: This document does not apply to ARD version 1.2 or earlier or version 2.0 or later.
This article has been archived and is no longer updated by Apple.
Remote Desktop 1.2.1 and later includes the "kickstart" command line utility. It allows you to install, uninstall, activate, configure, and/or restart components of Apple Remote Desktop without restarting the computer. You can configure all the features found in Apple Remote Desktop preferences.

The kickstart utility is saved here:

/System/Library/CoreServices/ARD Agent.app/Contents/Resources/kickstart

To use the kickstart utility, administrative permissions are required. To begin using the kickstart utility, use the sudo command, such as:

```
# sudo '/System/Library/CoreServices/ARD Agent.app/Contents/Resources/kickstart' -restart -agent
```

Note: All commands presented in this document should be typed as one line of text, though some of them may appear wrapped in your browser. To see the commands as one line, you may temporarily decrease text size in your browser or copy them to another application.

1. Activate Remote Desktop Sharing, enable access privileges for all users, restart ARD Agent:

```
# sudo '/System/Library/CoreServices/ARD Agent.app/Contents/Resources/kickstart' -activate -configure -access
-on -restart -agent -privs -all
```

2. Activate Remote Desktop Sharing, enable access privileges for the users "admin", grant full privileges for the users "admin", restart ARD Agent and Menu extra:

```
# sudo '/System/Library/CoreServices/ARD Agent.app/Contents/Resources/kickstart' -activate -configure -access
-on -users admin -privs -all -restart -agent -menu
```

Note: The -users flag should reference the shortname of a user of the system.

3. Activate Remote Desktop Sharing, disable access privileges for all users:

```
# sudo '/System/Library/CoreServices/ARD Agent.app/Contents/Resources/kickstart' -activate -configure -access
-off
```

Tip: For more information about using the kickstart command, add the -help
flag. For example:

```
# sudo '/System/Library/CoreServices/ARD Agent.app/Contents/Resources/kickstart' -help
```

Mac OS X Server 10.3: Sometimes Windows XP clients can‘t save to an SMB share point

Under certain circumstances, Windows XP clients cannot save larger files to an SMB share point hosted by Mac OS X Server.
This article has been archived and is no longer updated by Apple.
This happens only in certain applications, such as Adobe applications and AutoCAD.

To resolve the issue, update to Mac OS X Server 10.3.6 or later.
Published Date: Oct 11, 2016

AirPort Extreme: Computer Doesn‘t Start After Installing Card

Learn what to do if your computer doesn't start up normally after you install an AirPort Extreme Card.
This article has been archived and is no longer updated by Apple.

Symptom

After installing an AirPort Extreme card, the computer starts up into an unresponsive state known as a kernel panic. A message says to restart your computer, and it appears in several languages. In rare cases you might see lines of code-like text. To learn more about kernel panics, see technical document 106227, "**Mac OS X: What Is a Kernel Panic?**"

Solution

This can happen if the AirPort software on your computer is too old to be used with your AirPort Extreme Card. To resolve the issue, follow these steps:

1. Shut down the computer.
2. Remove the AirPort Extreme Card.
3. Restart the computer. It should start normally but may take a moment longer to check the disk.
4. Optional: Connect the computer to the Internet using wired Ethernet or a dial-up modem.
5. Update your software (this step may be done over an Internet connection or from software Installation CDs, if you have the right versions).

The following sections can help you with steps 4 and 5.

Connecting to the Internet

If you are going to update by downloading software, you need to connect a phone line or Ethernet cable to the computer. To use a phone line, you must have access to a dial-up Internet service provider account. Ethernet is used for broadband modems (such as cable and DSL) or when you are on an institutional network. If you have an AirPort Base Station, temporarily transfer its Ethernet or phone line to the computer.

Tip: Any time you move a broadband modem's Ethernet cable between a computer and a base station, you should unplug the modem's power source for a few seconds to ensure that it will recognize the newly-connected device. Many modems require this "reset" step when connecting to a different device. After you have updated your software and reconnected the Ethernet cable to your AirPort Base Station, you need to power cycle the modem again.

If you have Mac OS X 10.3 and need help connecting to the Internet, click the Assist Me button in the Network preference pane.

If you have Mac OS X 10.2.8 or earlier and need help connecting, see **Mac OS X Internet and Networking Topics**.

Updating Software

Method 1: Use Software Update

When you are connected to the Interenet, use the Software Update feature to ensure that you get the latest software versions.

Tip: Sometimes you have to update your Mac OS X software before you can use the latest AirPort software. For example: AirPort software version 3.1.1 requires Mac OS X 10.2.6 or later.

Follow these steps:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Software Update**.
3. Click the Update Now button.
4. Select any available AirPort or Mac OS X update, and follow the prompts to install them.

   Note: Because some updates are prerequisites for others, you may have to repeat steps 1 through 5 to be sure you have all relevant updates.

5. Restart the computer, and wait for the restart to finish.
6. Shut down the computer.
7. Reinstall the AirPort Extreme Card.

Method 2: Use the in-box AirPort Installation Disc

Your AirPort Extreme Card should come with a software installation disc. You may install software from this disc rather than connecting to the Internet via wire. However, this does not guarantee the latest software version. If you reinstall the AirPort Extreme Card after using the CD and find that the issue still occurs, then you should follow Method 1.

Important: When reinstalling the AirPort Extreme card, be sure that it is inserted in the correct direction and fully seated. The issue may occur if the card is upside down or partially seated.
Published Date: Oct 11, 2016

AirPort and AirPort Extreme: Using Public Networks, or "Hot Spots" to Access the Internet

You can use your AirPort-equipped computer at public Wi-Fi access points, known as "hot spots", which are frequently available at coffeehouses, book stores, hotels, airports, restaurants, and other public places around the world.
This article has been archived and is no longer updated by Apple.
All AirPort- and AirPort Extreme-equipped computers are Wi-Fi certified 802.11 devices, which means you can use them at public hot spots. All devices that earn the Wi-Fi certification are capable of interacting with each other, regardless of manufacturer. This is why you may see hot spots advertised as Wi-Fi. To learn more about Wi-Fi, see technical document 106421, "**AirPort and AirPort Extreme: Certified by Wi-Fi**."

There's a movement in progress to set up hot spots just about anywhere you can imagine. The movement can be characterized by two driving forces, which affect how you will log on at the hot spot. The first is commercial network providers. When you subscribe to one of their services, you can access the Internet from any of the hundreds or thousands of hot spots owned by that provider. This is especially useful when traveling between airports and hotels. The second driving force is a grass roots movement of small businesses and local Wi-Fi clubs that establish independent hot spots in a variety of locations.

Joining a network provider's hot spot

To join a network provider's hot spot, you need to set up an account with that provider. The provider typically offers a way for you to sign up immediately, at the hot spot itself. The provider may add variations to this theme, but it goes something like this:

1. Choose the provider's network from the AirPort menu, just as you would choose your own AirPort Base Station.
2. Open a Web browser, such as Safari.
3. The provider automatically pushes a page to your browser, or you enter the address specified in writing at the hot spot.
4. The page offers you a form where existing account holders may log in, and it includes a link for new customers to set up an account.

If your experience differs, follow the instructions that you find at the hot spot.

Joining an independent hot spot

The experience at non-network hot spots varies and is generally less formal (you are not as likely to see a web-based subscription form). Typically, you will choose the network from the AirPort menu, just as you would your own AirPort Base Station. If access is unrestricted, nothing else is required. If access is restricted, you would enter a password when prompted, just as you would for a password-protected AirPort Base Station.

You might get the password of the day if you buy a lattÃ© at a coffeehouse, for example. Just ask a staffer at the location what the wireless access policy is.

Establishing a hot spot

If you wish to establish a hot spot at your location, it can be simple. For the most basic hot spot, you only need two things: an appropriate connection from your Internet service provider (ISP) and a Wi-Fi certified wireless access point, such as the AirPort Extreme Base Station.

Because many people may use your hot spot at once, you will probably want to use a broadband ISP, such as a DSL, cable, or T-1 provider. Additionally, make sure not to violate the terms of your ISP contract. When allowing others to join your network, you may need a commercial account with your ISP.

A hot spot may involve multiple devices and may be much more complex. If you have questions about creating a hot spot, talk with a local network consultant. If you think your location might be eligible for contracting with a commercial network provider, you could consider that option.

Finding hot spots and network providers

Well-known hot spot providers in the United States and Europe include:

- T-Mobile
- Wayport
- Surf and Sip
- iPass
- Metronet

To locate a hot spot near you, use locator sites like these:

http://www.wi-fihotspotlist.com
http://www.wifinder.com
http://www.wififreespot.com/

Safari: AutoFill Is Turned Off by Some Websites

A website author may request that a browser temporarily turn off its auto fill feature, usually for security reasons. Safari honors these requests.
This article has been archived and is no longer updated by Apple.
If AutoFill does not work at a particular website or for part of a form, it is probably because the site author has turned it off. Financial sites do this most often (banks, brokerage houses, credit unions, and others).

Safari honors the AutoComplete="off" flag used by website authors. You can verify that the site author has turned off AutoFill by searching for this tag in the webpage's source file. From the **View** menu, choose **View Source**.

Mac OS X 10.3 or later: "Invalid user name and password combination" Message When Using Active Directory

When binding a Mac OS X client computer to Active Directory, the account entered is not validated (resolved) at that time. It is used as entered. If entered incorrectly, you will see an alert message later.
This article has been archived and is no longer updated by Apple.

Symptom

After configuring the Active Directory Directory Access plug-in, an alert message appears at the client computer that says "invalid user name and password combination."

Solution

This happens when an incorrect name and/or password is entered, including a username entered with incorrect syntax.

The user's login name (also known as "PrincipalName") is required when binding a computer to Active Directory.

The user can also use the short part of the login name (such as "virginia"). The typical syntax of a login name is similar to "virginia@domain.forest.company.com".

Note: If the user's login name has been modified from the default "virginia@domain.forest.company.com", then the default login name must be used. The modified login name (such as "virginia@email.company.com") cannot be used.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Activity Monitor: Process Name Appears Twice, or With Wrong PID

Under certain circumstances, Activity Monitor may show an application's name twice, and/or with the wrong process identification number ("PID"). The correct PID appears in Terminal.

This article has been archived and is no longer updated by Apple.

This issue does not affect system performance or behavior. If you notice this while troubleshooting a different issue, it shouldn't cause any additional concern.

The PID that appears in Terminal is correct.

If you don't know how to view process information in Terminal, you may do so using the "ps" or "top" commands. For example:

1. Open Terminal (/Applications/Utilities).
2. At the prompt, type: ps -aux
3. Press Return.

To learn more about ps or top, type "man ps" or "man top" in Terminal.

Network Image Utility: Can‘t add metapackages

The Network Image Utility allows you to add packages to be installed after the initial installation of the operating system. This feature works with individual packages, not metapackages.
This article has been archived and is no longer updated by Apple.

Symptom

You can't add metapackages to Network Installation Images using Network Image Utility.

Solution

This feature is not designed to work with metapackages. Follow the steps outlined in the System Image Administration guide for adding individual packages.

Macintosh Manager 2: AppleWorks Font Menu Lacks Font Previews

The AppleWorks font menu does not display font names in their own typefaces when the MMLocalPrefs extension is enabled.
This article has been archived and is no longer updated by Apple.

Symptom

Fonts in the AppleWorks fonts menu do not appear in their own typefaces.

Solution

This is the expected behavior when the MMLocalPrefs extension is enabled.

Important: You should not disable this extension without consulting with your network administrator. Other applications may not perform as expected if this extension is disabled.

About the Mac OS X Server 10.3.3 Update

This software updates Mac OS X Server version 10.3.2 to version 10.3.3.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.3. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

5. If you use a MySQL database, you must back it up prior to upgrade. See the Additional Information for MySQL section, below.

6. If you have set up a loginhook, a custom serial port configuration, or have edited the "/etc/ttys" file for other reasons, you will need to back it up prior to installation of this update.This is because the 10.3.3 update overwrites the file with a new copy. The new file will set the Xserve's serial port to communicate at 56Kbps. If your serial device cannot communicate at this speed, you must edit this file to reduce the speed.

Installation

There are two ways to update to Mac OS X Server 10.3.3: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see **How to Update Your Software**.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from **Apple Featured Software**.

The Mac OS X Server 10.3.3 Update is specifically for updating version 10.3.2. There is also a "**combo**" installer available, which will update version 10.3, 10.3.1, or 10.3.2.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the **Server Admin** application or the "**softwareupdate**" command-line tool. Choose the method that works best for you.

Enhancements

These are some of the enhancements that are part of Mac OS X 10.3.3 Server Update:

Open Directory (Directory Services)

- Improved Directory Services reliability in Active Directory Domains with large number of hosts/clients.
- Addresses an issue in which a Kerberized AFP server may return a "-5023" error when a client attempts mount a volume on the server.
- The Active Directory plug-in is no longer sensitive to the case of the domain; the plug-in now works in ".local" domain environments; the plug-in can now work with DNS records that don't have matching reverse lookup; and the plug-in can work in environments that are not hierarchical.
- Addresses an issue in which the response to certain DNS lookups could cause the lookupd process to quit, which would in turn cause the server to stop responding if Crash Reporter was enabled.

Network Services

- NAT Service: Port redirects function correctly after the natd.plist is modified with the appropriate redirect entries. Addresses an issue of incorrectly parsed redirect_port entries in /etc/nat/natd.plist causing an incorrect natd command to be written to /etc/nat/natd.conf.apple.
- NAT Service: Addresses an issue in which all network interfaces would be available for port forwarding under the "Network connection to share" menu in Server Admin. Now only the active network interfaces (as configured in Network preferences) should be available for selection.
- VPN Service : Addresses an issue in which VPN Server daemon may not be installed when upgrading from Mac OS X Server 10.2 to Mac OS X Server 10.3.
- VPN Service: Adds a tool which allows users in an LDAP domain to make VPN connections to the server via PPTP.
- VPN Service: Addresses an issue in which the server may experience a kernel panic if the VPN service is enabled and has active PPP interfaces.

General Networking

- Provides 802.1q Virtual LAN (VLAN) support on secondary PCI gigabit Ethernet cards available or included with Xserves. VLAN allows multiple computers that are on different physical LANs to communicate with each other as if they were on the same LAN. Benefits include more efficient network bandwidth utilization and greater security, because broadcast or multicast traffic is only sent to computers on the common network segment.
- Increases the size of the Ethernet receive ring elements (RxRingElements) from 64 to 256, which allows the server to handle high-volume inbound network traffic more efficiently.
- Addresses issues that could occur when connecting to a network device that is "locked" (the device forces the network speed and/or duplex setting), such as losing the network connection.
- AppleTalk Browsing is on by default in Directory Access. This setting allows browsing for servers in AppleTalk Zones with the default installation of this update.
- Resolves an issue in which name conflicts could occur among Network Service Entities, such as SLP, AppleTalk and SMB.
- All available servers can be seen when browsing Windows Workgroups or Domains.
- Enhancements to /Network browsing include: Servers appear on the desktop and in Finder window Sidebars; AFP Authentication options are available; and you can disconnect a server by dragging its icon on the desktop to the Trash or by clicking the Eject icon in the Sidebar.
- Improves compatibility for certain third-party wireless PC cards, such as the Honda AH-G10. More...
- Finder and applications that allow you to browse the file system now refresh the contents of a remote network volume's folder or directory if the folder's contents change.

File Services

- AFP: Addresses an issue in which files residing on a share point may have received a new modification date when opened but not modified. Refreshing the view of modification dates of files on a share point, when viewed from an AFP client, provides more consistent and rapid feedback to users.
- AFP: Improves handling of unexpected network interruptions while editing/saving files to a share point. A file may not have opened because it erroneously appeared to be locked or in use. In some cases this condition may have caused a kernel panic.
- Samba: This release includes Samba 3.0.2 distribution, providing additional features. See the samba.org **website** for more information about this release.

System Imaging (NetBoot/Network Install)

- Improves system reliability for NetBoot clients when used in "Diskless" configuration.
- Network Image Utility: Addresses issue in which the Image Information scroll arrow (up) does not appear to function.
- Network Image Utility: Addresses issue in which selecting Japanese as the default language for a newly created image reverts to English after clicking the Create button.
- Network Image Utility: Addresses issue in which the "Diskless" NetBoot option did not remain active after updating a NetBoot image to Mac OS X 10.3.2.
- Server Admin properly displays the available protocol for Mac OS 9 NetBoot Images as AFP when using the Japanese language.
- Addresses issue where non-English language NetBoot users with network home directories get the English Finder by default rather than language selected during NetBoot image creation.

Printing

- Addresses a missing text issue that could occur in Mac OS X 10.3.2 when printing a document that contains Japanese Hiragino OTF or

Kozmin CID fonts.

Mail Service

- Addresses an issue in which mail server preferences such as host lists, "bcc to", and relay were not retained when migrating to a new server using "amsmailtool".
- Addresses issue in which "seen flag" settings for each user are not migrated during mail migration using "amsmailtool".
- Improves the mailing list server configuration in Server Admin. You may now save multiple newly-created lists with a large number of members at once.
- Addresses an issue in which the WebMail login window displays English when user had set display options to Japanese.

Web Services

- Addresses an issue In Server Admin (Websites : General) in which erroneous IP addresses could have appeared in the IP Address pop-up menu. This could have occurred if you had recently viewed the same information in another Server Admin connection to another site.
- Allows more flexibility to use special characters in passwords, such as "$", during initial configuration in Server Assistant. In previous releases, inclusion of such characters prevented authentication during login.
- The Web Server log format has been revised to improve the data output for processing by third-party web log analysis software.
- Addresses an issue in which newly saved realms in the httpd.conf file may include artifacts, such as authentication name and limit directives from removed realms.

QuickTime Streaming Server

- Addresses potential denial of service attack that could prevent legitimate usage of the content. This issue is also addressed in a separate Security Update.
- Provides QTSS Live Broadcast with ability to provide streaming content to 3G phone users.
- Addresses an issue in which QuickTime Broadcaster does not send Japanese language annotations correctly to iTunes.
- Addresses an issue in which QTSS Publisher unnecessarily consumes CPU time if left open for a long time (such as 48 to 72 hours).
- Addresses an issue in which MP3 playlists couldn't be removed once published using QTSS Publisher.
- Addresses an issue in which QTSS Publisher does not hint or allow editing of annotations where filenames exceed 32 characters.

Server Administration Tools

- Server Assistant now offers activation of Apple Remote Desktop for the default administrator user account. This option provides automatic activation of the Apple Remote Desktop client service for remote control, software distribution, and so forth to the server before the first login.
- Optimized the way servermgrd plug-ins store history data to reduce idle time CPU load. This should increase responsiveness in server administration and general performance of services.
- Workgroup Manager: Sharing panel display performance improved, reducing the time required to display a large number of share points.
- Workgroup Manager: Sharing panel allows the Shared Library network mount to reside on a non-startup volume on the server. This allows for better organization and management of server network mounts.
- Addresses an issue in which "Copy these privileges to enclosed items" may time out on share points with large numbers of nested folders.
- Workgroup Manager: Addresses a cosmetic issue in the Sharing Panel in which a newly created share point icon may not have appeared.
- Workgroup Manager: Network Mounts: Re-authentication is no longer required after an unsuccessful mount record creation attempt.
- Workgroup Manager: Addresses an issue in the Sharing Panel which prevented dragging and dropping Active Directory groups into the Group ownership field from the Users & Groups list.

Application Server

- The Application Server component JBoss has been updated to allow administrators to take advantage of the new JDK 1.4.2.
- Japanese localized text is changed/corrected in Server Admin:Web:Realms and Server Admin:Mail:Overview.

Finder enhancements

- Improves security after an administrator authenticates a Finder action that the current user wouldn't normally be allowed to perform.

- Addresses an issue in which Finder does not refresh the contents of a remote network volume's folder or directory if the folder's contents change on the server.
- Addresses an issue in which Finder unexpectedly quits when many icons are dragged when the View menu option "Show icon preview" is enabled.
- Improvements when dragging hundreds of items, in both applications and Finder.

Disk Utility (AppleRAID)

- Provides support for online rebuilding of a failed mirrored RAID drive.

Other

- A System Preferences pane for UPS is now available in Energy Saver preferences when a UPS power management system is connected; overall support for UPS systems is improved.
- Mac OS X Server (10-User License) allows 10 individual client computers to connect to the server even when each computer has multiple connections in the form of directly connected users or automounts.
- The Xserve security lock option can now provide USB function for mouse and keyboard while still preventing drive modules from being ejected. This options is configured in the Security system preference for Xserve hardware and may also be remotely configured via command line.
- When the Xserve security lock option is enabled, it ejects any CD/DVD media that is inserted.

Additional Information for MySQL

Data stored in MySQL databases with the version of MySQL that is pre-installed Mac OS X Server 10.3.2 or earlier must be exported and re-imported in order to be compatible with version of MySQL that is pre-installed on Mac OS X Server 10.3.3, in which a byte-ordering issue is fixed.

As with any upgrade install, you should back up your old data. In this particular upgrade, the following process is recommended to convert the data to the correct byte ordering:

Before the upgrade, use the terminal to export the data from your pre-10.3.3 database:

```
#  mysqldump -p table > backup-file.sql
```

or

```
#  mysqldump  --opt database > backup-file.sql
```

After the upgrade, and after initializing the MySQL database, import the data:

```
#  mysql -p table < backup-file.sql
```

or

```
#  mysql  database < backup-file.sql
```

About the Mac OS X Server 10.3.3 Update (Combo)

This software updates Mac OS X Server version 10.3, 10.3.1, or 10.3.2 to version 10.3.3. It is a "combo" update that combines enhancements delivered with versions 10.3.1 through 10.3.3. If you already have Mac OS X Server 10.3.2, you may download a smaller update that is not a combo.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.3. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

5. If you use a MySQL database, you must back it up prior to upgrade. See the Additional Information for MySQL section, below.

Installation

There are two ways to update to Mac OS X Server 10.3.3: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see **How to Update Your Software**.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from **Apple Featured Software**.

Mac OS X Server 10.3.3 Update (Combo) updates Mac OS X Server 10.3, 10.3.1, or 10.3.2 to the later version.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the **Server Admin** application or the "**softwareupdate**" command-line tool. Choose the method that works best for you.

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with Mac OS X Server versions 10.3.1, 10.3.2, and 10.3.3.

Additional Information for MySQL

Data stored in MySQL databases with the version of MySQL that is pre-installed Mac OS X Server 10.3.2 or earlier must be exported and re-imported in order to be compatible with version of MySQL that is pre-installed on Mac OS X Server 10.3.3, in which a byte-ordering issue is fixed.

As with any upgrade install, you should back up your old data. In this particular upgrade, the following process is recommended to convert the data to the correct byte ordering:

Before the upgrade, use the terminal to export the data from your pre-10.3.3 database:

```
#  mysqldump -p table > backup-file.sql
```

or

```
#  mysqldump  --opt database > backup-file.sql
```

After the upgrade, and after initializing the MySQL database, import the data:

```
#  mysql -p table < backup-file.sql
```

or

```
#  mysql  database < backup-file.sql
```

Mac OS X Managed Client - List of Users Does Not Appear in Login Window

A list of users may no longer appear in the Login Window after updating to Mac OS X 10.3.2 or 10.3.3.
This article has been archived and is no longer updated by Apple.
This issue can happen when using:

- Mac OS X 10.3.2 or 10.3.3 managed clients
- Mac OS X Server 10.3 to 10.3.3
- Workgroup Manager

You should update the clients and server to 10.3.4 or later.

WebObjects 5.2: How to Specify the JDBC URL and Choose Database Server Character Encodings

Learn how to specify the correct JDBC URL to connect to a database from a WebObjects application, and see examples of database server encodings that support international characters.
This article has been archived and is no longer updated by Apple.
Character encodings can be set at various places in a WebObjects application, such as string encoding for session data, XML encoding, database server encoding, or the encoding used to communicate with the client Web browser. This document only discusses how to specify the correct JDBC URL syntax for a WebObjects application and shows examples of database server encodings to support international characters.

To enter the JDBC URL and connection dictionary:

1. Start the EOModeler tool.
2. Select Model, then New to get a new connection panel.
3. Enter the username and password.
4. For proper JDBC URL syntax, consult the following table.

Database Name	Example Database Server Encoding(s)	Example JDBC URL Format	WebObjects Default Encoding
Oracle	JA16SJIS, Unicode (AL32UTF8)	jdbc:oracle:thin:@<SERVERNAME>:1521:<DBNAME>	MS932, UTF8
Sybase	sjis, utf8	jdbc:sybase:Tds:<SERVERNAME>:11222/<DBNAME>	MS932
		jdbc:sybase:Tds:<SERVERNAME>:11222/<DBNAME>?CHARSET=utf8&JCONNECT_VERSION=6	UTF8
Microsoft SQL Server 2000	Japanese (cp932)	jdbc:microsoft:sqlserver://<SERVERNAME>:1433;DatabaseName=<DBNAME>	MS932, UTF8
MySQL	Unicode	jdbc:mysql://<SERVERNAME>/<DBNAME>?useUnicode=true&characterEncoding=MS932	MS932
		jdbc:mysql://<SERVERNAME>/<DBNAME>?useUnicode=true&characterEncoding=UTF8	UTF8
OpenBase	SHIFTJIS, Unicode UTF-8, Unicode Extended	jdbc:openbase://<SERVERNAME>/<DBNAME>	SJIS, UTF8
OpenLDAP	Unicode	ldap://<SERVERNAME>:389/<dn>	UTF8

Notes

1. Database Server Encoding:

Although Unicode or UTF is preferred for its portability, database server encoding tends to be selected by other system requirements or usage patterns. For example, if the database is only used in Japan, then Shift-JIS is probably the better choice. Typically, Japanese database servers are configured using "Shift-JIS" (and its variants such as "MS932"), Japanese EUC, UTF8, and UTF16.

2. WebObjects Default Encoding for Oracle, Sybase, Microsoft SQL Server 2000, MySQL:

If you use "MS 932" as the default encoding, you will be able to use the vendor's Japanese-specific character set. However, using "MS932" is limited to Japanese, while "UTF8" will cover a broad range of characters used in other languages.

See technical document **107667** for setting the browser's character encoding from a WebObjects application.

3. Database Adaptors and JDBC Drivers

For Mac OS X 10.2, Windows 2000, and WebObjects 5.2.1, see the Deploying Applications guide at:

http://developer.apple.com/documentation/WebObjects/Deployment/Deploying_Applications/Installation/chapter_3_section_4.html

Also see technical document **72598** on WebObjects Compatibility.

For Mac OS X 10.3, WebObjects 5.2.2, the following newer database versions and JDBC driver can be used, but they have not been officially

qualified by Apple:

- New JDBC driver MySQL Connector/J 3.0

  Important: Using the JDBC driver MySQL Connector/J 3.0 with OS X 10.3 allows you to use Japanese with the "text" external type. To avoid seeing garbled text with the "text" external type when using the older driver MySQL Connector/J 2.0, the JDBC URL must include the character encoding type "UTF8".

  Example:

  jdbc:mysql://<SERVERNAME>/<DBNAME>?useUnicode=true&characterEncoding=UTF8

  Note: The MySQL Connector/J 3.0 does not work with Windows 2000.

- OpenBase 8.0.0, which is the updated version of OpenBase 7.0.5.
- OpenLDAP 2.1.22

4. Additional information

For additional information, consult your JDBC driver documentation.

Oracle 9i
Database encoding supported for Japanese: JA16SJIS, or Unicode
JA16SJIS is Oracle's NLS style specifier for MS 932 and SHIFTJIS. It is usually chosen when the database is only used in Japan.

Sybase
JDBC URL Format: To specify the UTF-8 character set to support international characters, you need to add the CHARSET and JCONNECT_VERSION parameter values.Example:

jdbc:sybase:Tds:localhost:11222/JTest?CHARSET=utf8&JCONNECT_VERSION=6

Microsoft SQL Server 2000
The following data types are not supported in EOModeler or WebObjects applications:
'nchar', 'nvarchar', and 'ntext' data types.

OpenBase: To use vendor specific Japanese characters, select "Unicode UTF-8" or "Unicode Extended" as the database server encoding.

Bluetooth: Pairing takes longer when using a headset with Mac OS X 10.3

When you use a Bluetooth headset, it might take a little longer than normal to connect to other Bluetooth devices. This is expected.
This article has been archived and is no longer updated by Apple.
This delay can happen when adding a new device in the Bluetooth Setup Assistant or when reconnecting to a favorite device, such as a wireless mouse. If you'd rather not wait, turn off your headset while you pair other devices, then turn the headset back on.

This issue affects Mac OS X 10.3. For best results, use Software Update to get Mac OS X 10.3.9 and other suggest updates.
Published Date: Feb 17, 2012

Bluetooth: Headset doesn‘t appear in Sound preferences or Setup Assistant

Find out what to do if the "headset" choice doesn't appear in Sound preferences or in the Bluetooth Setup Assistant.

This article has been archived and is no longer updated by Apple.

If you use Bluetooth preferences to pair a headset, the headset choice may not appear in Sound preferences.

To avoid the issue, follow these tips:

- Use the Bluetooth Setup Assistant to pair the headset to the computer. For best results, do not pair the headset from Bluetooth preferences.
- In the Setup Assistant, select "headset" as the device you are trying to pair.

If the headset choice is missing in the Setup Assistant:

- Make sure you have installed Bluetooth 1.5 software or later, and that your Bluetooth adapter's firmware is up to date.
- To connect the headset to your computer, be sure to use your computer's built-in Bluetooth hardware or a D-Link DBT-120 USB adapter.

Bluetooth: System Requirements for Using a Headset

If you want to use a Bluetooth headset, your computer must meet the requirements listed in this document.

This article has been archived and is no longer updated by Apple.

Using a headset

To use a Bluetooth headset, your computer needs:

- Bluetooth 1.5 software or later
- Built-in Bluetooth hardware, or the D-Link DBT-120 USB adapter (rev. B2 or later)
- Up-to-date firmware for the adapter

To use with iChat

To use the headset with iChat, you should use iChat AV 2.1 Public Beta or later, which you can download from the iChat website (http://www.apple.com/ichat/). Earlier versions of iChat AV may not work reliably with a Bluetooth headset.

Mac OS X Server 10.3: Using the Case Sensitive/Journaled file system

Mac OS X Server 10.3 allows you to use the Case Sensitive/Journaled file system for data volumes. It is not intended for use on startup disks. This article has been archived and is no longer updated by Apple.
If you format a volume as Case Sensitive/Journaled and try to install Mac OS X Server on it, the Installer will tell you that you can't install on the selected volume until settings are changed.

When you need to use the Case Sensitive/Journaled file system, you should partition the server's hard disk (or use multiple hard disks). Put case sensitive items on a Case Sensitive/Journaled volume, and install Mac OS X Server on a volume that is not case sensitive.

Examples of reasons to use the Case Sensitive/Journaled file system are:

- When hosting (non-boot) data volumes containing case sensitive files
- As a higher performance alternative to UFS
- Situations where you need a file system that supports case sensitivity and journaling
- When you need to use case sensitive volumes larger than 1 TB (UFS supports volumes up to 1 TB ; HFS Plus supports volumes up to 16 TB)
- Situations where you have legacy UNIX applications and scripts that require or were only designed for case sensitive file systems

Mac OS X 10.2, Managed Client: Printing from Classic applications while restricting access

Using the Capabilities feature of Accounts preferences, you can limit the applications available to local user accounts. Workgroup Manager allows you to do the same thing for managed network clients if you use Mac OS X Server.

This article has been archived and is no longer updated by Apple.

When you start managing application access, Classic applications may not be able to print. If that happens, simply add the PrintMonitor utility to the list of allowed applications.

Published Date: Feb 17, 2012

Mac OS X Server 10.2: AFP is required to start Mac OS 9 NetBoot clients

For Mac OS 9 clients to successfully use NetBoot, Apple File Service (AFP) must be running on the server.
This article has been archived and is no longer updated by Apple.
When AFP is not running at the server, Mac OS 9 clients that try to use NetBoot process will display a gray screen, pause, then possibly start up from a local volume.

If this happens when AFP is running, be sure that none of your network hardware, such as a switch or router, is interfering with AFP traffic. A simple test for isolating your network hardware is to run a crossover cable between a Mac OS 9 client and the server.

Be sure that any switches and routers have the latest firmware that is available from their manufacturers.
Published Date: Feb 17, 2012

Mac OS X and AirPort: About "Using DHCP with manual address"

The "Using DHCP with manual address" feature is for connecting to routers that use the DHCPINFORM protocol. AirPort base stations assign addresses without using this protocol.
This article has been archived and is no longer updated by Apple.
In Mac OS X 10.2 and later, Network preferences lets you choose the "Using DHCP with manual address" option as a way to configure your computer's TCP/IP settings.

If you choose this option when connected to an AirPort or AirPort Extreme base station, you are assigned a subnet mask of 255.0.0.0, and no router address is assigned. You can't connect to the Internet. This could also happen when connecting to any router that doesn't use DHCPINFORM.

To connect to an AirPort base station, configure "Using DHCP" or "Manually".

Mac OS X Server 10.3: Changing the hostname with the changeip command

The Mac OS X Server Setup Assistant gives examples of proper hostnames. If you need to change the hostname after using the assistant, this document explains how.
This article has been archived and is no longer updated by Apple.
The Setup Assistant gives these examples when it asks you to enter a hostname:

server.example.com
www.example.com

This is the correct form for a hostname in Mac OS X Server 10.3, and it's the form that will be listed for the HOSTNAME in the "/etc/hostconfig" file on a properly configured server.

If you need to change the hostname later, you can use the "changeip" command in Terminal. To learn more about the command, see the Mac OS X Server Command-Line Administration Guide or type "man changeip" in Terminal.

About the Application Servers Update 2.0 for Mac OS X Server 10.3

This document contains an overview and download information for the Application Servers Update 2.0. Apple recommends this update to deployers of applications on WebObjects, JBoss, or Tomcat on Mac OS X Server 10.3. The update also includes WebObjects 5.2.3, which has formal support for Java 1.4.2.
This article has been archived and is no longer updated by Apple.
This update upgrades various Java application server components shipped in Mac OS X Server 10.3. WebObjects 5.2.3 deployment, which contains many important fixes and is qualified on the Java 1.4.2 platform. JBoss is upgraded to version 3.2.3 and contains new security features and fixes. Tomcat has been updated to version 4.1.29 and is fully integrated with the JBoss distribution.

Installing Application Servers Update on Mac OS X Server 10.3

The update requires:

- Mac OS X Server 10.3.3 or later
- Mac OS X Server 10.3.3 is available via Software Update.
- Java 1.4.2 (bundled with Mac OS X Server 10.3.3)

Follow these steps:

1. Install Mac OS X Server 10.3, and update to 10.3.3 via Software Update.
2. Install the Applications Server Update via Software Update or manual download.

Important: For JBoss deployers who have customized their /Library/JBoss/3.2/bin/run.conf file: This update installs a new /Library/JBoss/3.2/bin/run.conf file. The original file will be renamed to run.conf.applesaved. It is up to the administrator to merge any customizations back into the new run.conf file.

For more information on WebObjects 5.2.3, see document **107873**.

See the JBoss website for more information on JBoss, or the Apache website for more information on Tomcat

Mac OS X Server: Holding N key does not select the default NetBoot image

Some server documentation says that pressing the N key as the computer starts up chooses the default NetBoot image. This is not actually the case.

This article has been archived and is no longer updated by Apple.

The NetBoot image for a client is stored on the server. The client will start up from the previously selected NetBoot image, whether or not you hold down the N key during startup.

To select a NetBoot startup image for a Mac OS X 10.2 or later client, use Startup Disk preferences. To select a NetBoot startup image for a Mac OS 9 client, use the Startup Disk control panel version 9.2.4 or later.

Published Date: Oct 7, 2016

Mac OS X Server 10.2: The "No such directory" message may safely be ignored

The System Log may contain a specific "No such directory" message that you can safely ignore.
This article has been archived and is no longer updated by Apple.
The specific message is:

bootpd[915]: ni_pathsearch '/config/NetBootServer' failed: No such directory

This message can safely be ignored.
Published Date: Oct 7, 2016

Mac OS X Server 10.2: Portmap must be running if you use an /etc/exports file

You can use Workgroup Manager to configure NFS exports, but Mac OS X Server also allows you to use a standard /etc/exports file. In the latter case, the portmap process must be running for the NFS exports to be shared.
This article has been archived and is no longer updated by Apple.
The server must meet one of the following conditions for portmap to start during system startup:

- The server is a NetInfo parent.
- There are already NFS exports in NetInfo (as happens when using Workgroup Manager to create the export).
- /etc/hostconfig has an entry that says RPCSERVER=-YES-
- /etc/hostconfig has an entry that says NETINFOSERVER=-YES-

WebObjects: About the 5.2.3 Update

This document contains an overview and download information for the WebObjects 5.2.3 Update. WebObjects 5.2 users who want formal qualification and support for Java 1.4.2 should install this update. WebObjects 5.2 users who plan to develop their WebObjects applications on Mac OS X 10.3.3 or who use the Xcode development tool suite or plan to deploy their WO 5.2 applications on Mac OS X Server 10.3.3, Windows, or Solaris should also install this update.
This article has been archived and is no longer updated by Apple.
The WebObjects Current Patch List contains information on all available patches and updates for all versions of WebObjects. Read this document if you're not sure which update you need on your system.

This update address issues with CLOSE_WAIT states in deployment using JavaMonitor and wotaskd. It also addresses a number of issues related to EOF under high load.

WebObjects 5.2.3 Developer for Mac OS X 10.3.3

Important: There are two mutually exclusive updates for this platform. If you have WebObjects 5.2 Developer installed on Mac OS X 10.3, you need the WebObjects 5.2.3 Developer update. If you have WebObjects 5.2 Deployment installed on Mac OS X Server 10.3, you need the WebObjects 5.2.3 Deployment update. You do not need both on any system.

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system is visible and available for download. If you prefer to download and install the package manually, follow the instructions below.

System requirements

WebObjects 5.2.3 Developer requires:

- Mac OS X 10.3.3 or later
- Xcode 1.1 Developer tools
- Java 1.4.2

If you have not yet updated to the correct version of Mac OS X or Developer Tools, you must do so before installing WebObjects 5.2.3. Mac OS X 10.3.3 and the Xcode 1.1 Developer tools are available through Software Update.

If you are creating a new Mac OS X WebObjects 5.2.3 development system, you should install the software in the following order:

1. Install Mac OS X 10.3
2. Update to Mac OS X 10.3.3
3. Xcode Developer tools CD
4. Xcode 1.1 Software Update
5. WebObjects 5.2 Developer
6. WebObjects 5.2.2 Developer
7. WebObjects 5.2.3 Developer

Manually installing WebObjects 5.2.3 Developer on Mac OS X 10.3.3

These instructions are for manually downloading and installing WebObjects 5.2.3 Developer. If you are installing using Software Update, see the previous section of this document.

System requirements

WebObjects 5.2.3 Developer requires:

- Mac OS X 10.3.3 or later
- JDK 1.4.2
- Xcode 1.1 Developer Tools

If you have not yet updated to the correct version of Mac OS X, Java, or Developer Tools, you must do so before installing WebObjects 5.2.3.

1. Go to http://www.apple.com/support/downloads and download the WebObjects 5.2.3 Developer update. The disk image should expand after downloading, leaving WO523Developer.pkg.
2. Open WO523Developer.pkg. The Authenticate panel opens.
   Important: Only an administrator can install the update.
3. Type the proper administrator name and password to authenticate.
4. Click OK to proceed. The Introduction panel appears.
5. Click Continue. The Software License Agreement appears.
6. Read the software license agreement, then click Continue.
7. Click Agree to agree to the license agreement, and continue the installation.
8. Select the volume containing Mac OS X and WebObjects 5.2 Developer.
9. Click Continue.
10. Make sure that there are no WebObjects or EOF applications running.
11. Click Install to proceed with installation. The Installer window displays information about the progress of the installation, which may take several minutes.
12. Restart your computer.

WebObjects 5.2.3 Deployment for Mac OS X 10.3.3 Server

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system is visible and available for download. See document **107869** for more information on the Applications Servers update for Mac OS X Server.

Important: If you have installed the Application Servers update and have WebObjects services that do not run upon restart, see document 107909.

System requirements

WebObjects 5.2.3 Deployment requires:

- Mac OS X Server 10.3.3 or later
- Java 1.4.2

If you have not yet updated to the correct version of Mac OS X Server, you must do so before installing WebObjects 5.2.3. Mac OS X Server 10.3.3 is available through Software Update

If you are creating a new Mac OS X WebObjects 5.2.3 deployment system, you should install the software in the following order:

1. Mac OS X Server 10.3
2. Mac OS X Server 10.3.3
3. Application Server Update

Configuration tasks:

1. wotaskd is not configured to autostart by default. Open the file /System/Library/StartupItems/WebObjects/WebObjects and uncomment the following line:

   ```
   "$WOSERVICE" -appPath "$WOTASKD" >/var/log/webobjects.log 2>&1 &
   ```

2. If you are planning to use Apache, you will need to update the httpd.config file. Add the following to the end of the file /etc/httpd/httpd.config:

   ```
   # Including WebObjects Configs Include /System/Library/WebObjects/Adaptors/Apache/apache.conf
   ```

Manually Installing WebObjects 5.2.3 Deployment on Mac OS X Server 10.3.3

These instructions are for manually downloading and installing WebObjects 5.2.3 Deployment. If you are installing using Software Update, see the previous deployment section of this document, WebObjects 5.2.3 for Mac OS X Server 10.3.

System requirements

WebObjects 5.2.3 Deployment requires:

- Mac OS X Server 10.3.3 or later
- Java 1.4.2

Follow these steps:

1. Go to http://www.apple.com/support/downloads
2. Download the Application Servers Update package for Mac OS X Server 10.3.3. Stuffit Expander should automatically expand the archive, leaving a disk image with the ApplicationsServerUpdate.pkg.
3. Open ApplicationsServerUpdate.pkg. The Authenticate panel opens.
   Important: Only an administrator can install the update.
4. Type the proper administrator Name and Password to authenticate.
5. Click OK to proceed. The Introduction panel appears.
6. Click Continue. The Software License Agreement appears.
7. Read the software license agreement, then click Continue.
8. Click Agree to agree to the license agreement and continue the installation.
9. Select the volume containing Mac OS X and WebObjects 5.2 Deployment.
10. Click Continue.
11. Make sure that there are no WebObjects or EOF applications running.
12. Click Install to proceed with installation. The Installer window displays information about the progress of the installation, which may take several minutes.
13. Restart your computer.

Installing WebObjects 5.2.3 on Windows 2000

System Requirements

WebObjects 5.2.3 Developer/Deployment requires:

- Java 1.4.2 (J2SE SDK)
- WebObjects 5.2.2

If you see panels indicating that certain files being replaced by the update are "locked" during installation, click Reboot to continue the installation. The files will be replaced upon restarting.

This update cannot be uninstalled alone. Once you have upgraded to WebObjects 5.2.3 you cannot revert to a previous version of WebObjects 5.2. However, the entire WebObjects 5.2.3 installation can be uninstalled using the Add/Remove Programs control panel.

Follow these steps:

1. Download the self-extracting update installer for Windows 2000.
2. Log in as a user with Administrator privileges.
3. Make sure that there are no WebObjects or EOF applications running.
4. Open WO523.exe to start the installation process. A screen appears with some information about this update.
5. After you have read the information screen, click Next to continue. The license agreement for this update appears.
6. To agree to the license and continue the installation, click Yes. The update will be installed on your system and you will be asked if you want to restart.
7. Select "Yes, I want to restart my computer now" to restart Windows.
8. The WinZip self-extractor automatically quits and removes its temporary files in about 20 seconds.

Installing WebObjects 5.2.3 on Solaris

System Requirements

WebObjects 5.2.3 Deployment requires:

- Java 1.4.2 (J2SE SDK)
- WebObjects 5.2.2

If you have not yet updated to these versions, you must do so before installing WebObjects 5.2.3.

Follow these steps:

1. Download the update installer for Solaris and the update installation script, patcher.sh.
2. After you have downloaded the files, the patcher.sh script needs its executable bit set. At the command prompt enter:

   ```
   chmod 511 patcher.sh
   ```

3. Log in as root.
4. Ensure that there are no WebObjects or EOF applications running, including Monitor.
5. If a web server is running on the computer on which you are installing the update, stop it.
6. Stop WebObjects services (wotaskd and woservice) using the WOServices script. At the command prompt enter:

```
cd $NEXT_ROOT/Library/WebObjects/Executables ./WOServices stop
```

These services will restart when you restart the computer after installing the update.

7. To Install the update, cd to the directory containing the update and the patcher.sh installation script. Then at the command prompt enter:

```
patcher.sh -install WO523Solaris.tar.gzip
```

For more information on using patcher.sh, at the command prompt enter:

```
patcher.sh -help
```

8. Copy the updated WODocument root to your web server's document root.

```
cp -r $NEXT_ROOT/Library/WebObjects/WODocumentRoot/WebObjects <webserver doc root>/WebObjects
```

9. Restart your computer.

Issues resolved in WebObjects 5.2.3

Support for single byte numbers broken

Apple Reference 3100683

ISSUE:

Specifying an attribute that mapped to a single byte external database type with a value type of 'b' and NSNumber value class was broken.

RESOLUTION:

This specific case has been enabled.

Checked boxes generated by WOCheckedboxMatrix do not align correctly in some cases.

Apple Reference 3148863

ISSUE:

If the text to the right of the checked boxes takes more than one line and if it wraps, the checked boxes are aligned between the lines instead of aligning at the first line.

RESOLUTION:

This issue has been resolved.

The escapeHTML binding was missing in certain WOComponent such as WOSubmitButton.

Apple Reference 3197639

ISSUE:

The logic for handling the escapeHMTL binding of WOSubmitButton was missing.
As a result, JavaWebObjects.framework always replaced the "&" character with the "&" string.

RESOLUTION:

The logic for handling the escapeHTML binding has been added to WOInput. The escapeHMTL binding can be manually added to subclasses of WOInput such as WOSubmitButton by using the Binding Inspector of WebObjects Builder.

NullPonterException raised in com.webobjects.eocontrol.EOEditingContext._eoForGID

Apple Reference 3206657

ISSUE:

Under some circumstances, this exception is thrown when calling EOEditingContext.saveChanges().

RESOLUTION:

This issue has been resolved.

Multithreaded EOF access causes NPE in EODatabaseContext

Apple Reference 3219139

ISSUE:

Under heavy load, multithreaded EOF throws a NullPointerException while saving changes.

```
java.lang.NullPointerException
        at com.webobjects.eoaccess.EODatabaseContext.createAdaptorOperationsForDatabaseOperation(EODatabaseContext.java:5467)
        at com.webobjects.eoaccess.EODatabaseContext.performChanges(EODatabaseContext.java:6291)
        at com.webobjects.eocontrol.EOObjectStoreCoordinator.saveChangesInEditingContext(EOObjectStoreCoordinator.java:411)
        at com.webobjects.eocontrol.EOEditingContext.saveChanges(EOEditingContext.java:3130)
```

RESOLUTION:

This issue has been resolved.

WOMessage.appendHeader() needs to check for duplicate values

Apple Reference 3219197

ISSUE:

Under some circumstances, appendHeader can continually add duplicate values to a header.

RESOLUTION:

This issue has been resolved.

Certain cookies were not handled properly.

Apple Reference 3274806

ISSUE:

Whenever the last attribute-value pair of a cookie contains a null value, an NSForwardException for java.lang.StringIndexOutOfBoundsException get thrown.

RESOLUTION:

This issue has been resolved.

Deadlock in a single threaded application when garbage collection occurs

Apple Reference 3277451

ISSUE:

Under some circumstances, some customers were seeing deadlocks when some EnterpriseObjects were being finalized and an attempt to take a lock on them occurred.

RESOLUTION:

This issue has been resolved.

Potential deadlock when EOSharedEditingContexts are involved

Apple Reference 3323120

ISSUE:

Under some circumstances, EOF would deadlock when faults were fired and objects were being finalized.

RESOLUTION:

This issue has been resolved.

componentsSeparatedByString wrong when chopping strings of only separators

Apple Reference 3323130

ISSUE:

If a string contains only separators, or multiple separators in a row, this method may produce an array with too few empty strings.

RESOLUTION:

This issue has been corrected.

JSModalWindow inserts a spurious newline

Apple Reference 3323144

ISSUE:

JSModalWindow inserts a spurious newline.

RESOLUTION:

This issue has been resolved.

Deadlock with nested EOEditingContexts

Apple Reference 3342847

ISSUE:

Under some circumstances, unlocked child EOEditingContexts were leaving locks on their parent EOEditingContexts.

RESOLUTION:

This issue has been resolved.

Batch faulting not generating the correct SQL

Apple Reference 3428581

ISSUE:

Under some circumstances, would not generate the correct EOFetchSpecification when batch faulting.

RESOLUTION:

This issue has been resolved.

Performance problems within component caching

Apple Reference 3467030

ISSUE:

Inefficient cache lookups for components caused a lot of disk usage.

RESOLUTION:

This issue has been resolved.

WOComponent.path() breaks API compatibility

Apple Reference 3467194

ISSUE:

WOComponent.path() in 5.2.2 broke previous behavior and returned a URL formatted path. Pre-5.2.2 behavior has been restored.

RESOLUTION:

This issue has been resolved.

NullPonterException in WOResourceManager.stringForKey() for invalid key

Apple Reference 3473069

ISSUE:

If WOResourceManager.stringForKey() is called for an invalid key, we throw and exception instead of returning null.

RESOLUTION:

This issue has been resolved.

The Java source files generated by EOModelder could not be customized in per project basis.

Apple Reference 3473117

ISSUE:

The Java source files generated by EOModelder could not be customized in per project basis by providing a local copy of EOJavaClass.template file in the project folder, as documented in WebObjectsTools_Techniques.pdf.

RESOLUTION:

This issue has been resolved.

primeApplication(String, URL, String) should not be deprecated

Apple Reference 3484678

ISSUE:

WOApplication.primeApplication(String mainBundleName, URL mainBundlePathURL, String nameOfApplicationSubclass) was mistakenly marked as deprecated in javadoc.

RESOLUTION:

This issue has been resolved.

WOSortOrder generates an illegal element "border=0" in the <A> html tag.

Apple Reference 3489479

ISSUE:

The <A> tag generated by WOSortOrder contains an element "border=0", which is not a legal element for the <A> html tag.

RESOLUTION:

This issue has been resolved.

Certain legacy ProjectBuilder projects did not build after upgrading to Xcode projects.

Apple Reference 3493962

ISSUE:

When a legacy ProjectBuilder project was first opened with Xcode, the option of upgrading to Xcode project was offered. However, the upgrading process failed whenever the main aggregate target name of a legacy ProjectBuilder project did not match with the project name. As a result, the upgraded Xcode project does not build properly.

RESOLUTION:

The resolution is to manually rename the main aggregate target name of the project to match with the project name using either the legacy ProjectBuilder or Xcode, save and close the project, re-open the project with Xcode, and finally then rename the main aggregate target name to its original value.

REGRESSION:WO5.2.2: WOFileUpload generates exception when no file selected at submission

Apple Reference 3508033

ISSUE:

WOFileUpload could generate a ClassCastException when no file is selected and the form is submitted.

RESOLUTION:

This issue has been resolved.

wotaskd and monitor leave sockets in a CLOSE_WAIT state

Apple Reference 3535483

ISSUE:

Under some circumstances, a socket leak occurred when http 1.0 was used. We think a majority of the CLOSE_WAIT problems pertaining to wotaskd and monitor are addressed.

RESOLUTION:

This issue has been resolved.

NullPointerException at EOEditingContext._setRecordIsInitialized()

Apple Reference 3538032

ISSUE:

It is possible to see this exception when an EO is deleted and updated within the same event (usually save changes)

RESOLUTION:

This issue has been resolved.

Monitor potentially leaked a socket when adding new hosts

Apple Reference 3551310

ISSUE:

When adding new hosts, Monitor potentially could leak a socket per host.

RESOLUTION:

This issue has been resolved.

To-one relationship does not update correctly when destination entity has boolean attribute

Apple Reference 3108071

ISSUE:

Upon saving changes, the destination entity with boolean attributes does not commit correctly to the database because the snapshot is in an invalid state.

RESOLUTION:

In order to resolve this problem, the behavior of a boolean attribute that is defined with a Number value class and value type of 'c' will now return a Boolean value instead of an Integer value.

Troubleshooting

1. My application is throwing the exception "com.webobjects.foundation.NSForwardException for java.lang.NoClassDefFoundError: javax/servlet/ServletContext"

For some reason, the necessary packages are not in your classpath. Debug your classpath to make sure the javax.servlet.* classes are there. If the classes are not found, the resolution is to download the servlet.jar and put it into /Library/Java/Extensions or in your classpath. The servlet.jar can be found with many open source distributions (e.g tomcat).

2. How do I convert my legacy WebObjects application to build as a true war bundle?

1. In Xcode, configure your build settings to the following:

```
SERVLET_SINGLE_DIR_DEPLOY = NO
SERVLET_STUB_WAR = NO
SERVLET_TRUE_WAR = YES
SERVLET_DEPLOY_LICENSE = <your deployment license>
SERVLET_WEBAPPS_DIR = /Library/JBoss/3.2/deploy
```

2. Add the JavaWOJSPServlet.framework to your project
3. You should also verify that all of your custom frameworks are being built as jar files and are installed or linked into /Library/WebObjects/lib.

Mac OS X Server: Guidelines for relocating the server during initial setup

If possible, you should place a server in its final network location (subnet) before configuring it for the first time.
This article has been archived and is no longer updated by Apple.
If you are concerned about unauthorized or premature access during setup, you can set up a firewall to protect the server while you're finalizing its configuration.

If you can't avoid moving a server after initial setup, you must change location-dependent settings before it can be used. For example, the server's IP address and hostname must be updated.

When you move a server, take these guidelines into account:

- Minimize the time the server is in its temporary location so that the information you need to change is minimized.
- Postpone configuring services that depend on network settings until the server is in its final location. These include Open Directory replication, Apache settings (such as virtual hosts), DHCP, and other network infrastructure settings that other computers depend on.
- Avoid importing final user accounts. Limit accounts to test accounts so you minimize the user-specific network information (such as home directory location) that will need to change.
- After moving the server, use the changeip command-line tool to change IP addresses, host names, and other data stored in Open Directory NetInfo and LDAP directories on the server. Because changeip doesn't actually change the server's IP address, you use the networksetup or serversetup command (or Network preferences) to change the server's IP address in its network settings. See the command-line administration guide for more information.
- Reconfigure the search policy of computers (such as user computers and DHCP servers) that have been configured to use the server in its original location.

Mac OS X Server 10.3: Upgrading Password Server users to Kerberos and single sign-on

After upgrading a Mac OS X Server from 10.2 to 10.3, follow the steps listed here to upgrade Password Server users to Kerberos.
This article has been archived and is no longer updated by Apple.
After the upgrade, user accounts whose password type was Password Server automatically have a password type of Open Directory and can use the authentication methods supported by Open Directory Password Server. If you want them to use Kerberos and single sign-on authentication, you need to upgrade the accounts.

1. Open Workgroup Manager.
2. From the **View** menu, choose **Accounts**.
3. Click the Users button.
4. Click the small globe icon (above the list of users).
5. From the pop-up menu that appears, open the directory domain where the user accounts reside.
6. Click the lock and authenticate as a directory domain administrator.
7. Select one or more user accounts in the list, and click Advanced.
8. Set User Password Type to "Crypt password" or Shadow Password (whichever is available).
9. Enter and verify a new password for the selected user or users.
10. Click OK, then click Save.
11. Set User Password Type to Open Directory.
12. Enter and verify a new password for the selected user or users.
13. Click OK, then click Save.
14. Tell users the password you assigned, and advise them to change the password in Accounts preferences the next time they log in.

Mac OS X Server: Windows 95/98 clients do not see share points or printers with longer names

Windows 95/98 clients do not see the names of share points or printers hosted from the server when the names are longer than 12 characters.
This article has been archived and is no longer updated by Apple.
To browse or connect to printer or disk shares on Mac OS X Server from a Windows 95/98 client, the share name must be 12 characters or less. For more information, see the Microsoft support site.

Safari: eBay access may be blocked for some legally sensitive items

If eBay thinks you are located in a certain country, they may block your access to certain legally restricted items.
This article has been archived and is no longer updated by Apple.
This is the message you see from eBay:

"Unfortunately, access to this particular category or item has been blocked due to legal restrictions in your home country. Based on our discussions with concerned government agencies and eBay community members, we have taken these steps to reduce the chance of inappropriate items being displayed. Regrettably, in some cases this policy may prevent users from accessing items that do not violate the law. At this time, we are working on less restrictive alternatives. Please accept our apologies for any inconvenience this may cause you, and we hope you may find other items of interest on eBay."

If you are not in Germany, follow these steps:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **International**.
3. If the Language tab is not already selected, click it.

4. Click the Edit button.
5. Deselect Deutsch, and click OK.
6. Quit Safari.
7. Reopen Safari.

Mac OS X Server 10.3: When is diskless NetBoot available?

You can use diskless NetBoot with Mac OS X 10.3 and later NetBoot images.
This article has been archived and is no longer updated by Apple.
Diskless NetBoot is not available with Mac OS 9 NetBoot, Mac OS X 10.2 NetBoot, or for any Network Installation images.
Published Date: Oct 7, 2016

Bluetooth: Static heard on Bluetooth headset

Other wireless devices around you could cause static on your Bluetooth headset.

This article has been archived and is no longer updated by Apple.

When this happens, the clarity of your audio is reduced. It may sound "digitized."

Wireless devices that use the same frequencies as your headset increase the likelihood of this happening. Examples include AirPort (802.11) connections, cordless phones, and other Bluetooth devices.

Turn off any Bluetooth or AirPort services and devices you're not using, and move your phone or its base away from your computer.

Published Date: Oct 7, 2016

Mac OS X, Managed Client: Users with low UIDs do not appear in the login window

Users with identification numbers (UIDs) lower than 500 do not appear in the login window, whether or not the client is managed.
This article has been archived and is no longer updated by Apple.
Mac OS X normally creates user accounts with UIDs of 501 and higher. Under some circumstances, you may have users with lower UIDs. Examples include when:

- Binding to an Open Directory server, such as LDAP or NIS
- Importing users
- Changing UIDs with administration tools

An alternate scenario in which some users may not appear is when you have more than 500 LDAP users.
Published Date: Oct 7, 2016

AirPort Extreme: WDS auto setup may not work if the admin computer has a static IP address

When you are using AirPort Admin Utility to set up a wireless distribution network (WDS), make sure the admin computer's Network preferences are set to get its IP address via DHCP.
This article has been archived and is no longer updated by Apple.
If the admin computer has a static IP address, the AirPort Admin Utility won't be able to connect to a remote base station to configure it.

If you don't want to change the admin computer's settings, you can create a second location for configuring the base stations. In the second location, drag AirPort to the top of the port configurations list.

WebObjects 5.2: Fixing a java.lang.NoClassDefFoundError exception after upgrading to Mac OS X 10.3

Learn how to set the correct JVM in a WebObjects application that failed to run with a java.lang.NoClassDefFoundError exception. This would occur when using WebObjects 5.2.2 after an upgrade to Mac OS X 10.3.
This article has been archived and is no longer updated by Apple.
Running a WebObjects application that was created on an earlier system can produce an immediate java.lang.NoClassDefFoundError exception upon launch. This will happen even after the project is rebuilt on a Mac OS X 10.3 system.

To check that the proper JVM is set:

1. Open the application with Xcode.
2. Expand the "Targets" column on the left.
3. Select the main project target. For example, if the main project is named "MyApp", select "MyApp" target.
4. Double-click the project target to get the Settings display.
5. Select Expert View.
6. Set the correct value for the JAVA_VM variable:
7. JAVA_VM = java

The reason is that the JVM version was hard-coded into a variable in the project. After upgrading to Mac OS X 10.3, the default JVM, as defined in the project, has not changed and still points to the older JDK 1.3.1 with the following value:

JAVA_VM = /System/Library/Frameworks/JavaVM.framework/Versions/1.3.1/Commands/java

Setting the JAVA_VM to the correct value will fix the runtime error. Please note that Mac OS X 10.3 requires JDK 1.4.1.

Using client-side certificates in Safari

Safari 1.2 and later offer support for client-side certificates, which are a security used by some websites that place a high priority on security.
This article has been archived and is no longer updated by Apple.
To use Safari 1.2 or later, you must have Mac OS X 10.3 or later.
Published Date: Oct 7, 2016

Mac OS X: Recursively removing files and directories on HFS file systems

Some implementations of the "rm" command line tool (and other tools that support the recursive removal of files and directories) depend on an unspecified behavior outlined below.
This article has been archived and is no longer updated by Apple.
The unspecified behavior is outlined in the following "pseudo code":

```
opendir();
while (readdir()) unlink();
closedir();
```

The unspecified behavior is what readdir() should return after the directory has been modified. Many file systems have been implemented such that subsequent readdir() calls will return the next directory entry. The implementation of the HFS file system cannot guarantee that all enclosed files or directories will be removed using the above method.

The Mac OS X "rm" command does not exhibit this behavior because it uses the fts(3) library functions to traverse the directory hierarchy, which causes the entire contents of the directory to be read before modifying it.

The Solaris and GNU "rm" commands are known to be implemented using the readdir/unlink loop above. So, attempts to recursively remove files and directories using those tools may fail.

Symptom

You are unable to reliably recursively delete files and directories on HFS file systems using tools other than the Mac OS X "rm" command.

Products affected

Any operating system using a tool to recursively remove files on an HFS file systems

Examples: Linux, Solaris, and so forth on an NFS export of the HFS file system

Note: The Mac OS X "rm" command is able to properly execute a recursive removal of files and directories.

Solution

The readdir()/unlink() loop needs to call rewinddir() either after each unlink() call, or whenever readdir returns NULL immediately after files have been unlinked. For example:

"The following pseudocode describes this solution:"

```
opendir();
do {
    unlinkedfiles = 0;
    while(readdir()) {
        unlink();
        unlinkedfiles = 1;
    }
    if (unlinkedfiles)
        rewinddir();
} while (unlinkedfiles);
closedir();
```

The GNU coreutils "rm" command was recently updated to do this on "affected" systems. However, that code is only used if the configuration scripts can determine that the system has this issue. This requires that the GNU coreutils be built on an HFS file system (NFS-exported, if building on a non-Mac OS X platform). Alternatively, one could simply modify the GNU coreutils source to force the constant HAVE_WORKING_READDIR to be undefined or defined to be zero (0).

Muting audio on a Bluetooth headset

To mute audio on a Bluetooth headset, turn down the volume in the application that is providing audio.

This article has been archived and is no longer updated by Apple.

For example, if you're listening to music in iTunes, drag the volume slider all the way down to mute the headphones.

You might still hear audio on a Bluetooth headset after:

- Pressing the mute key
- Turning the system volume all the way down using the media keys on the keyboard
- Turning the volume down with the audio menu bar item

The media keys on your Apple keyboard can be used to adjust the sound level of your Bluetooth headset, but not to completely mute it.

You might also notice that the Mute option is dimmed in Sound preferences.

Apple Remote Desktop 1.2.1: Meanings of the menu bar icons

The Apple Remote Desktop menu bar item displays an icon when Apple Remote Desktop Client is running. The icon changes according to the status of Apple Remote Desktop and the type of observation or administrator control that is active.

This article has been archived and is no longer updated by Apple.

This table describes the icons used in version 1.2.1 or later.

Icon	Description
	Not Active ARD has been installed but is not running on the client system.
	No Administrator ARD has been installed and is running on the client system, but no administrator is available.
	Ready ARD is installed and running on the client system, and an administrator is available.
	Observed ARD is installed and running on the client system, and an administrator is available and currently monitoring activity on the client system.
	Assisted The system is being monitored by an administrator who also shares control of the screen with the user. The administrator and the user are both able to view the client system's screen and work with the client computer.
	Remote The system is being monitored and controlled by a remote administrator. The local user is a passive observer.

Mac OS X Server 10.3: "We hit a bug" message appears when creating a mailing list

Mac OS X Server 10.3 includes a Web interface for mailing list administration. If you create a new mailing list with this tool, you may see a message that says, "We're sorry, we hit a bug!"
This article has been archived and is no longer updated by Apple.
This Mailman interface is available at http://myserver.com/mailman/admin, where "myserver.com" would be replaced with the address of your server.

When you try to save a new mailing list, you see this message:

> Bug in Mailman version 2.1.2
>
> We're sorry, we hit a bug!
>
> If you would like to help us identify the problem, please email a copy of this page to the webmaster for this site with a description of what happened. Thanks!

This message is followed by a detailed traceback.

To resolve the issue, follow these steps:

1. Open Terminal (/Applications/Utilities/).
2. Type: `sudo chmod g+w /var/mailman/data/aliases.db`
3. Press Return.
4. Use Server Admin to remove the partially created list.

Mac OS X Managed Client 10.3: Duplicate Apple bookmarks in the Dock

If you have used Workgroup Manager to configure Dock items for more than one kind of account (user, group, or computer list), a user's Dock may contain duplicate Apple bookmark items.
This article has been archived and is no longer updated by Apple.
This occurs when you have given the affected account the ability to add and remove Dock items as part of your Managed Preferences settings for that account and when you are managing at more than one account level (user, group, and/or computer list).

The user can manually remove duplicate bookmark from the Dock.

Alternatively, the duplicate item should go away if you deselect the "User may add and remove additional Dock items" option for that account.

Xserve: Apple File Service, Windows sharing, and KDC do not automatically start after restarting the server

Apple File Service (AFP), Windows sharing (SMB), and the Kerberos Key Distribution Center (KDC) may not automatically start after you restart the server.
This article has been archived and is no longer updated by Apple.
This happens if you are using only the PCI Ethernet card and not the built-in Ethernet port. This issue affects:

- Mac OS X Server 10.3 to 10.3.2
- Xserve

There are two ways to avoid the issue. One is to use the built-in Ethernet port. The second is to configure the built-in Ethernet port, but not use it. Follow these steps:

1. Enable the built-in Ethernet port.
2. Configure it for a static IP address.
3. Save the changes.
4. Don't connect a cable to the port.

This document will be updated when more information is available.

Mac OS X Server 10.3: SMTP server may remain "disabled" after you try to start it

The SMTP server included in Mac OS X Server 10.3 may not appear to start in some situations. Learn to work around this issue.
This article has been archived and is no longer updated by Apple.

After you turn on the SMTP server (shown above), it may still appear to be disabled.

This happens when using Mac OS X Server 10.3 to 10.3.2.

Follow these steps to resolve the issue:

1. Stop the Mail server by clicking the Stop Service button in the Mail Service module of Server Admin.
2. Wait 10 seconds.
3. Restart the Mail server by clicking the Start Service button in the Mail Service module of Server Admin.

Mac OS X Server 10.3: Home directories not created for some users

If you select several hundred users in Workgroup Manager and click the Create Home Now button in the Home tab, some of the selected users' home directories are not created.
This article has been archived and is no longer updated by Apple.
This happens when using Mac OS X Server 10.3 to 10.3.9.

Note that there is no message to indicate success or failure in creating the home directories.

To avoid the issue, create the home directories in smaller batches. Select up to 250 users at a time.
Published Date: Oct 7, 2016

Mac OS X 10.3: Tasks that use an NFS export from a Linux server may become unresponsive ("hang")

When an application or tool tries to acquire or test for locks on files from a Linux-hosted NFS export, the action may be blocked indefinitely, potentially hanging the application or tool.
This article has been archived and is no longer updated by Apple.
The Linux NFS file locking implementation has a limitation in which NFS file locking requests may only contain cookies that are 8 bytes or smaller.

This limitation means that Linux NFS file locking will not work with NFS clients that use NFS file lock request cookies larger than 8 bytes. Currently, this includes Mac OS X 10.3 and FreeBSD 5 (from which the Mac OS X implementation is derived).

An update for the Linux kernel is available at:

http://www.fys.uio.no/~trondmy/src/Linux-2.4.x/2.4.23-rc1/

Apply the patch linux-2.4.23-03-fix_osx.dif to the Linux kernel sources and rebuild.

Other workarounds:

- Mount the Linux-served NFS filesystems using the -L option, which disables file locking support for that mount.
- To disable all NFS file locking support for the affected client, change its /etc/hostconfig default value "NFSLOCKS=-AUTOMATIC-" to be "NFSLOCKS=-NO-", and restart.

  Note: If the client is also an NFS server, then file locking will also be disabled for service that it offers.

Mac OS X Server: Web service may not start after upgrading from 10.2 to 10.3 or 10.3.1

After upgrading from Mac OS X Server 10.2.x to either 10.3 or 10.3.1, Web service may not start.
This article has been archived and is no longer updated by Apple.
This affects Mac OS X Server 10.2 to 10.2.8 when upgraded to 10.3 or 10.3.1

To avoid this issue, update the server to the most recent version (10.3.2 or later) before trying to start the Web service.

If you've already encountered the issue, follow these steps:

1. Open Terminal (/Applications/Utilities/).
2. Type:`sudo apachectl configtest`
3. Press Return.
4. Type your administrator password when prompted, then press Return.

This will check the syntax of the Apache configuration files. If you see a syntax error with a line number of the file "/etc/httpd/httpd.conf" that says "CacheRoot takes one argument, The directory to store cache files", then take these additional steps:

1. As the root user, make a copy of the file "/etc/httpd/httpd.conf".
2. Still as root, open /etc/httpd/httpd.conf using a text editor.
3. Look for a line that says

   ```
   CacheRoot ""
   ```

   Important: Be sure to choose a line that does **not** start with a number sign (#).

4. Edit the line to say:

   ```
   CacheRoot "/private/var/run/proxy"
   ```

   Tip: If you use a text editor that displays line numbers, this can help you make sure you're editing the line that was mentioned earlier in the syntax error.

5. Save the changes to /etc/httpd/httpd.conf.
6. Type: `sudo apachectl configtest`
7. Press Return. This time, a message saying "Syntax OK" should appear.
8. Open Server Admin and start the Web service.

Web service should now start.

Mac OS X Server 10.2 and Later: Learn about Web Performance Cache

The Web Performance Cache interacts with various Web server functions. This document explains how it is configured by default, which may assist you when configuring Mac OS X Server Web services.

Except where noted, this information applies to Mac OS X Server 10.2 or later.
This article has been archived and is no longer updated by Apple.

Important notes about Web Performance Cache

The Web Performance Cache is enabled by default on Mac OS X Server 10.3 or later. It improves the performance of the Web server under certain circumstances, but you should be aware of the following:

- When the Web Performance Cache is enabled for any virtual hosts, a process named webperfcache runs, and takes over the listener on the configured TCP port (usually port 80). The Apache Web server is then configured to listen on a different TCP port (usually port 16080). All requests are received by the webperfcache process, and they are either served from the in-memory cache, or they are relayed to the Apache Web server. In the latter case, the Web Performance Cache then receives a response from the Apache Web server, saves it in its in-memory cache (if it can be cached and caching is enabled for that virtual host), and returns the response to the requester.

- The Web Performance Cache is not compatible with Apache's connection KeepAlive mechanism. By default, the KeepAlive mechanism is disabled and cannot be controlled by the Server Admin application. If you want to enable KeepAlive for your websites, you must use a text editor to change the KeepAlive setting in /etc/httpd/httpd.conf and use Server Admin to disable Web Performance Cache for all your websites.

- If a request contains Cookie headers, Web Performance Cache considers the request uncacheable and does not cache any responses for that request.

- Web Performance Cache respects the expiration times of cacheable items such as images, audio, and video files. By default these are all configured to expire after one hour. If you are running a busy website with Web Performance Cache enabled, and you notice a heavier load on your Apache Web server once per hour, it may be due to the image, audio, and video files all expiring at once. You may be able to flatten the load profile by staggering the expiration times of these file types. These are controlled by Apache's ExpiresByType directive. This directive is not configurable with the Server Admin application, so you'd need to use a text editor to edit /etc/httpd/httpd.conf.

- Mac OS X Server 10.3 or later only: Web Performance Cache is started at system startup by the Apache startup item, based on the setting of WEBPERFCACHESERVER in /etc/hostconfig.

- Web Performance Cache is not compatible with SSL. You should not enable both Web Performance Cache and SSL for a specific site. Doing so keeps Apache from starting.

- The amount of RAM WebPerfCache uses for its cache is determined by the WebPerfCacheRAMAvailable setting in the `webperfcache.conf` file, if present. That directive is commented out in the default version of this configuration file, so WebPerfCache will use all the physical RAM for its cache.

  Note that WebPerfCache can use a maximum of 2097151 KB of RAM for its cache. If a computer has 2G or more of physical RAM, WebPerfCache will not be able to determine the proper amount of memory to use for its cache. In that case, you must specify a value for WebPerfCacheRAMAvailable in the `/etc/webperfcache/webperfcache.conf` file. The maximum usable value is:

  ```
  WebPerfCacheRAMAvailable 2097151
  ```

- Performance Cache must be disabled if you wish to serve files larger than 2GB via HTTP/Apache. When Web Performance Cache is enabled, downloads larger than 2GB in size get truncated to 2GB.

- When running PHP or other dynamic web page generation, Web Performance Cache can cause the performance of dynamically generated content to be slower. While the Performance Cache will improve the performance of static content, you should disable the Performance Cache when using the server primarily for dynamic content.

- Additional information about the Web Performance Cache can be found in its configuration file: /etc/webperfcache/webperfcache.conf

Mac OS X Server 10.3: Windows client authentication stalls when used as a PDC

When many Windows clients are logging in and Mac OS X Server 10.3 is used as a primary domain controller (PDC), authentication may stall.
This article has been archived and is no longer updated by Apple.
This mainly occurs when a large number of Windows users try to log in simultaneously, such as in a classroom environment.

Lookupd's default of 64 threads may not be high enough for large numbers of simultaneous Windows logins. To verify this is the issue, execute this command in Terminal when the logins are slow:

```
# top -l0 | grep lookupd
```

Tip: The three characters following "top" are minus, ell, and zero. Be sure to include all spaces as above. You can copy and paste into Terminal. The number sign (#) and first space represent the prompt in Terminal, so don't copy them.

While running, the above command will display data about the lookupd process that is updated every second. The number in the fifth column is the number of threads. If this is near 64, the number of threads needs to be increased. Press Control-C to stop the process.

To increase the number of threads, execute these commands in Terminal:

```
# sudo nicl . create /locations/lookupd MaxThreads 128
# sudo nicl . create /locations/lookupd MaxIdleThreads 4
# sudo killall -1 lookupd
```

Threads are created only when needed and killed when no longer needed. This change uses no additional system resources when the system isn't loaded.
Published Date: Oct 7, 2016

Mac OS X Server 10.3: Update software remotely using Server Admin

This article has been archived and is no longer updated by Apple.

In Mac OS X Server 10.3 and later, you can update software remotely using the Server Admin. This is an alternative to using the command line tool for remote updates.

Note: This method does not work with Mac OS X Server 10.4 or 10.4.1. In versions, use the "softwareupdate" command line tool instead. Once you have updated to Mac OS X Server 10.4.2 or later, you can install later updates using this method.

The Server Admin application offers the same function as Software Update preferences, but with the additional ability update your server remotely.

Follow these steps to update your server software using Server Admin.

1. Open Server Admin and connect to your server.
2. Under the Computers & Services column, click the server to be updated.
   Note: If you have not added your server to this list, please do so before trying this step.
3. At the bottom of the Server Admin window, click the Update button.
4. A Check Now button appears in the pane above the Update button. Click this button to see all available updates for your server software.
5. Once you see the list of available updates, select those you wish to install.
   Note: If no updates appear in this window, your software may be up-to-date, or you may not have Internet access.
6. After selecting the updates you wish to install, click the Install button.
7. While the software is downloading and installing, you will see percentage complete progress for each installation, along with the progress indicator.
8. When the Status of each package is "Installed," restart the server.

To learn more, see Getting Started with Mac OS X Server and How to Update Your Software.

Network Image Utility: Can‘t make a NetBoot image from source larger than 2.5 GB

If you try to make a NetBoot image from a source disk image that contains more than 2.5 GB of data, your attempt will not succeed.

This article has been archived and is no longer updated by Apple.

Network Image Utility will report the creation was successful, but it really isn't. The Network Image Utility log, which can be seen by clicking the triangle in the bottom of the window, will show error messages.

This occurs with Mac OS X Server 10.3 or later.

To resolve the issue, follow these steps:

1. Double-click the image to mount it.
2. Select the mounted volume as the source in Network Image Utility.

Published Date: Oct 7, 2016

Mac OS X Server 10.3: How to enable NetBoot 1.0 for older NetBoot client computers

You can enable NetBoot 1.0 for older client computers by using the "nicl" command-line tool.
This article has been archived and is no longer updated by Apple.
If you want older computers such a tray-loading iMac or Power Macintosh G3 (Blue and White) to use NetBoot, you need to enable NetBoot 1.0. You may do this by using Terminal or NetInfo Manager.

Note: Apple does not provide free-of-charge technical support for this configuration. You may receive technical support with an appropriate support contract.

Using Terminal

To use Terminal, execute these commands:

```
sudo nicl . create /config/dhcp old_netboot_enabled port_list
sudo killall bootpd
```

Note: Replace "port_list" with the list of ports you want to enable, formatted like:

```
en0 en1 en2
```

Note: NetBoot 1.0 and 2.0 can run on the same network interface simultaneously.

Using NetInfo Manager

1. Navigate to /config/dhcp in NetInfo Manager.
2. Create a property named: old_netboot_enabled
3. Assign the values for the "port_list", or network adapters you wish to enable this property for.

Additional information

The "old_netboot_enabled" attribute enables NetBoot 1.0 (BOOTP-based) NetBoot on the specified list of interface. You can have only one server providing NetBoot 1.0 BootP addressing on a subnet. Leaving the "port_list" blank will enable this property on all ports.

To learn more about bootp, see the bootpd man page and the Mac OS X Server System Image Administration guide.

Safari: Unable to download attachments from Hotmail

When you try to download an attachment from Hotmail, you are asked to sign in again.
This article has been archived and is no longer updated by Apple.
This happens when using:

- Mac OS X 10.2 or later
- Safari 1.0 or later
- MSN Hotmail

For Mac OS X 10.2 to 10.2.8, use another browser to download attachments, such as Internet Explorer.

For Mac OS X 10.3 or later, update to Mac OS X 10.3.4 or later.
Published Date: Oct 7, 2016

Safari may not work after an Archive and Install

If Safari won't work after you do an Archive and Install, follow the instructions below.
This article has been archived and is no longer updated by Apple.
When you try to open Safari after an Archive and Install, the Safari icon may bounce in the Dock and display the triangle that indicates activity, though no window appears.

This occurs when performing an Archive and Install of an older version of Mac OS X over a newer version. For example, you might Archive and Install Mac OS X 10.3.5 on a computer that, prior to the install, had Mac OS X 10.3.9. The best solution is to update to the same version of Mac OS X that you had before the Archive and Install, or a later version.

iMac, Power Mac G4 Cube: Issues with Nortel Baystack switch

The Power Mac G4 Cube and some models of flat-panel iMac computers are unable to maintain a link with Nortel Baystack 5510-24T and -48T switches.

This article has been archived and is no longer updated by Apple.

Symptom

When data is sent to an affected computer connected to a Baystack switch:

- The link light on the switch intermittently blinks (as the link is dropped, then brought back up).
- Network performance is poor.
- The Macintosh system.log has many "Link is down" and "Link is up" entries.

Products affected

- iMac (15-inch Flat Panel) 700 MHz and 800 MHz
- iMac (17-inch Flat Panel) but not the "17-inch 1GHz" model
- Power Mac G4 Cube
- Nortel Baystack 5510-24T and 48T

Solution

Update the firmware of the affected switch to version 4.0.0 or later, available from the Nortel website.

WebObjects services do not start during system startup after using Applications Server Update 2.0

If you install the version of Applications Server Update 2.0 that was available prior to 18 March 2004 on Mac OS X Server 10.3.3, WebObjects 5.2.3 services do not start during system startup.
This article has been archived and is no longer updated by Apple.
Important: Users who are unfamiliar with command line interface and manual configuration in general should proceed with caution or preferably seek assistance. Assistance in setting up or creating Startup Items is not part of Apple's complimentary technical support for new products. Users interested in fee-based support for setting up and creating Startup Items or shell scripts should contact Apple Professional Services.

Symptom

WebObjects services (wotaskd and, optionally, JavaMonitor) normally start automatically during the operating system's startup process. But after installing Applications Server Update 2.0, WebObjects 5.2.3 services do not start. This will prevent deployed WebObjects applications managed by JavaMonitor from starting automatically and from being managed by JavaMonitor.

Notes:

1. WebObjects 5.2.3 Developer is not affected.
2. If you obtained Applications Server Update 2.0 on 18 March 2004 or later, you do not need to perform the solution.

Solution

Two files deleted from /System/Library/StartupItems/WebObjects by Applications Server Update 2.0 must be replaced. After doing so, WebObjects services will automatically start during system startup. Follow these steps:

1. Be sure you are logged in to the server with an administrator account.
2. Open Terminal, and execute these commands:

```
# cd ~
# mkdir WO523
# cd WO523
# pico StartupParameters.plist
```

3. Carefully copy the text below, and paste it into the pico editor in the Terminal window.

   Begin copying below this line.

```
{
  Description     = "WebObjects Services";
  Provides        = ("WebObjects Services");
  Requires        = ("Disks", "Network");
  OrderPreference = "Last";
  Messages =
  {
    start = "Starting WebObjects Services";
    stop  = "Stopping WebObjects Services";
  };
}
```

   End copying above this line.

4. Save the file (Control-O, Return), and exit pico (Control-X).
5. Execute this command in Terminal:

```
# pico WebObjects
```

6. Carefully copy the text below, and paste it into the pico editor in the Terminal window.

   Begin copying below this line.

```
#!/bin/sh
#
# Start and Stop WebObjects Services
#
```

```
. /etc/rc.common

WOSERVICE="/System/Library/WebObjects/JavaApplications/wotaskd.woa/\\
Contents/Resources/javawoservice.sh"

WOTASKD="/System/Library/WebObjects/JavaApplications/wotaskd.woa/wotaskd"
WOJAVAMONITOR="/System/Library/WebObjects/JavaApplications/\\
JavaMonitor.woa/JavaMonitor"

GREP=/usr/bin/grep
AWK=/usr/bin/awk
PS=/bin/ps

PRINTSTARTSTOPMESSAGES="YES"

##
# Start WebObjects services
# (Services to be stopped by this script must use "javawoservice.sh".)
##
StartService ()
{
    if [ -x "$WOSERVICE" ]; then

        if [ "$PRINTSTARTSTOPMESSAGES" = "YES" ]; then
            ConsoleMessage "Starting WebObjects services"
        fi

        if [ -e /var/log/webobjects.log ]; then
            mv /var/log/webobjects.log /var/log/webobjects.log.1
        fi

        ####

        parents="$parents $parent"

        for child in $WOSERVICECHILDPIDS
        {
            children="$children $child"
        }

}

#kill them all at once
    kill $parents $children
}

##
# Restart WebObjects Services
##
RestartService ()
{
    ConsoleMessage "Restarting WebObjects services"

    PRINTSTARTSTOPMESSAGES="NO"

    StopService
    StartService
}

##
# Stop Process by PID
##
StopPID ()
{
    `kill "$1"`
}

RunService "$1"
```

End copying above this line.

7. Save the file (Control-O, Return), and exit pico (Control-X).
8. In Terminal, execute these commands. Note that the first use of sudo will prompt you for your administrator password.

```
# cd /System/Library/StartupItems/WebObjects
# sudo mv ~/WO523/StartupParameters.plist .
# sudo mv ~/WO523/WebObjects .
# sudo chown root:wheel StartupParameters.plist WebObjects
# sudo chmod 644 StartupParameters.plist
# sudo chmod 755 WebObjects
```

9. Test the validity of the WebObjects shell script with the following command. Fix any errors before proceeding.

```
# sh -n WebObjects
```

10. Execute this command to start WebObjects services:

```
# sudo SystemStarter start "WebObjects Services"
```

You were successful if the output contains "Starting WebObjects services" followed by "Startup complete."

Mac OS X, Mac OS X Server: 10.3.3 Update overwrites /etc/ttys file

If you have customized the file /etc/ttys, back it up before updating to 10.3.3 and restore it afterward. The 10.3.3 updates for Mac OS X and Mac OS X Server replace this file .

This article has been archived and is no longer updated by Apple.

If you updated without backing up the /etc/ttys file, these customized features don't work as expected:

- Login and/or logout hooks
- Secure console in single-user mode
- Customized communication speed on the Xserve's serial port

The change made to the /etc/ttys file for 10.3.3 is to set the communication speed on the Xserve's serial port to 56 kbit/s.

Published Date: Oct 7, 2016

Mac OS X 10.3.3: USB device, FireWire device, RAID card or SCSI card doesn‘t work after updating to 10.3.3

If a USB or FireWire device, RAID PCI card, or SCSI PCI card does not work after installing the 10.3.3 Update (on Mac OS X or Mac OS X Server), then you can resolve the issue by updating to 10.3.4.
This article has been archived and is no longer updated by Apple.
Symptoms you might see on an affected system include:

- External or internal SCSI devices that are not recognized.
- USB or FireWire disks (or devices with file systems) do not mount.
- If the startup volume is on a SCSI drive, the computer may stop responding ("hang") during startup.
- Apple System Profiler may recognize some devices that are not recognized elsewhere in the system.

If the affected computer can start up, update to Mac OS X or Mac OS X Server 10.3.4.

If the the computer won't start up, try using Safe Mode to update to 10.3.4. If it still won't start, these are some tips you can follow.

Xserve RAID Admin 1.3: Documentation for v1.2 also applies to v1.3

Xserve RAID Admin 1.2 documentation also applies to Xserve RAID Admin 1.3.
This article has been archived and is no longer updated by Apple.
Documentation available for Xserve RAID Admin 1.2 continues to apply to Xserve RAID Admin 1.3, which was released to fix a number of issues and improve overall reliability.

For PDF manuals, see the Apple Server Documentation webpage.

Mac OS X Server 10.3: Creating an HTTP network install image

Network Image Utility in Mac OS X Server 10.3 can't create an install image for delivery over HTTP, but you can do it using this workaround.
This article has been archived and is no longer updated by Apple.
If you must install over HTTP, follow these steps to prepare an image:

1. Make sure the image is smaller than 2 GB. If necessary, use Disk Utility to compress it.
2. Use a text editor to open the file NBImageInfo.plist (inside the image's .nbi folder) and change the value of the "Type" key from "NFS" to "HTTP."
3. Open Server Admin, select NetBoot, click Settings, and check in the General pane to make sure the volume containing the image is enabled for storing images.
4. In the Image pane, disable and re-enable the image.
5. Select Web in the Computers & Services list, click Settings, then click Sites.
6. Double-click the default site that supports NetBoot (Library/WebServer/Documents), click Options, and deselect Performance Cache.
7. NetInstall the client.

This information appears in Late Breaking News, available from the Help Center in Mac OS X Server.

AirPort for Mac OS X 10.3 or later: Using different types of wireless security (WEP and WPA)

Wireless networks may use one of several common security schemes, such as Wired Equivalent Privacy (WEP) and Wi-Fi Protected Access (WPA). Mac OS X 10.3 or later automatically recognizes which type of Wi-Fi security is being used and gives you the correct prompt.
This article has been archived and is no longer updated by Apple.
WPA is a very secure encryption method that is now preferred for **computers that can use it**. WEP is an older encryption method that is less secure, but it is useful if your network has systems that are not WPA capable.

Mac OS X 10.3 or later automatically recognizes if the network you are joining uses WEP or WPA, and it gives you the correct prompt. This is the one you see for WEP:

If you join a WPA network, Mac OS X 10.3 or later shows you this prompt:

In addition to being much more secure, WPA is also easier to use. WPA works best in Mac OS X 10.3.3 or later with AirPort software 3.3 or later.

There are two ways to set up WPA, Personal and Enterprise. WPA Personal is easier to set up if you have a small network, such as in your home. You would set it up using AirPort Admin Utility, much as you may have for WEP in the past.

For a school or business, WPA Enterprise can provide each user with unique credentials. WPA Enterprise uses the same security as WPA Personal, but with the added measure of individual usernames and passwords (WPA Personal uses a shared password). Each wireless base station communicates with a RADIUS server to authenticate the user's credentials. When joining a WPA Enterprise network, Mac OS X 10.3 or later would give you this prompt that includes username and password:

The basis of WPA Enterprise is 802.1X, which can be used with either wired or wireless networks. It requires more extensive knowledge to set up than WPA, which is advertised by the wireless access point. If you encounter the older "802.1X Authentication" method, the user will be prompted with a WEP password dialog box. The 802.1x Authentication method is not recommended, because it uses a static key and is less secure. You may need the help of a network administrator to join an 802.1x network.

About the Mac OS X Server 10.3.4 Update

This software updates Mac OS X Server version 10.3.3 to version 10.3.4.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.4. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.3.4: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see How to Update Your Software.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software.

The Mac OS X Server 10.3.4 Update is specifically for updating version 10.3.3. There is also a "combo" installer available, which will update version 10.3, 10.3.1, 10.3.2, or 10.3.3.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements

These are some of the enhancements that are part of Mac OS X 10.3.4 Server Update:

Open Directory (Directory Services)

- Password Server: Addresses issue in which Password Server replicas have incomplete databases and use 100% of the CPU time, causing the server to operate slowly. The affected Password Server Replication log file displays the message "DoSyncWithServer: error = -14090."
- Passwords: Addresses an issue in which inclusion of the dollar sign ($)in the password of the the primary administrator (UID 501) results in unexpected server behavior. Reported symptoms include Password Server not starting, unreliable LDAP services, and the inability to log in at the Login
- LDAP: Addresses issue in which Open Directory client computers will not rebind to an LDAP master after waking from sleep. This issue may also prevent the network users list from appearing on the client computer.
- LDAP: The LDAP server has been enhanced to allow more client connections. This improves server performance by allowing more than 250 client connections and reducing the total CPU usage. Note: The maximum number of client connections is approximately 1000.
- Active Directory Plug-in: Addresses an issue in which attributes/values may be lost if when modified by the Workgroup Manager Inspector, particularly when administrators attempt to change values for attributes that have "multiple" values (all of the old values may be deleted while keeping the new value intact).

- Active Directory Plug-in: Addresses an issue in which clients fail to bind to the directory master when computer is in a domain separate from the user. For example: If all users are members of the top-level domain, and all computers are in a domain lower in the hierarchy, users attempting to bind the computer to the top-level domain will not succeed.
- Addresses an issue in which accounts with a period in the UPN (User Principal Name) may not be able to log in.
- Active Directory Plug-in: Enhances client-server interaction by requiring clients to only read group information for each user as on-demand, reducing network-server bandwidth usage by each client.
- Directory Services: Improves performance of Directory Services (DirectoryS process) by reducing the total CPU usage for servers with significant uptime.

Network Services

- DNS: Enhances DNS code to deal with large network infrastructures (more than 10 DNS servers). This enhancement should improve experience when performing activities such as web browsing, Active Directory integration, and connections to Microsoft Exchange servers in this type of networking environment.

File Services

- NFS: Resolves a situation in which you have issues while trying to search NFS reshared volumes mounted at a client. (The search never finishes in Mac OS X and Sherlock; Mac OS 9 says the volume was modified by another process and to try again.)
- AFP/NFS: Addresses an issue that causes the message "unexpected problems occurred" when executing a Sherlock search for a file or folder on an AFP reshared volume which has originally been exported using NFS (such as from Linux, NetApp, or Solaris).

System Imaging (NetBoot/Network Install)

- Network Image Utility: Addresses an issue in which more than one package added to a Network Install image will not install on the targeted client computers.

User Management (Managed Client)

- Addresses an issue in which the Login Window will not display the list of users when local users or administrators are not enabled for clients.

Mail Service

- Mailman: Addresses an issue in which mailman lists no longer accept new mail after using the repair permissions feature of Disk Utility on the server's startup disk.

Web Services

- Site Administration: Addresses an issue in which no sites can be created on a server that had no defined websites at the time of being upgraded from 10.2 to 10.3. The resultingmessage is "Uncaught exception raised in Web client-side plugin."
- Configuration Files: Multiple RegisterResource directives may now be manually added to the httpd.conf file without being overwritten by Server Admin activities.

Server Administration Tools

- Server Admin Application: Software Update pane GUI has been enhanced to display software updates flagged as requiring "Reboot". This may allow you to better plan your updates during off-hours, for example.

Disk Utility

- Addresses an issue in which Disk Utility will not open on a client computer started up from a NetInstall image that was created from a configured volume (rather than a CD/DVD).

Other

- Addresses issue in which some USB-, Firewire-, SCSI-, and PCI RAID card-connected devices may not mount after applying the Mac OS X 10.3.3 Software Update. See document 107914.

Published Date: Oct 7, 2016

About the Mac OS X Server 10.3.4 Update (Combo)

This software updates Mac OS X Server version 10.3, 10.3.1, 10.3.2, or 10.3.3 to version 10.3.4. It is a "combo" update that combines enhancements delivered with versions 10.3.1 through 10.3.4. If you already have Mac OS X Server 10.3.3, you may download a smaller update that is not a combo.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.4. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

5. If you are updating from 10.3.2 or earlier and use a MySQL database, you must back it up prior to upgrade. See the Additional Information for MySQL section, below.

6. If you are updating from 10.3.2 or earlier and have set up a loginhook, a custom serial port configuration, or have edited the "/etc/ttys" file for other reasons, you will need to back it up prior to installation of this update.This is because a 10.3.3 or later update overwrites the file with a new copy when updating from 10.3.2 or earlier. The new file will set the Xserve's serial port to communicate at 56Kbps. If your serial device cannot communicate at this speed, you must edit this file to reduce the speed.

Installation

There are two ways to update to Mac OS X Server 10.3.4: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see How to Update Your Software.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software.

Mac OS X Server 10.3.4 Update (Combo) updates Mac OS X Server 10.3, 10.3.1, 10.3.2, or 10.3.3 to the later version.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with Mac OS X Server versions 10.3.1, 10.3.2, 10.3.3, and 10.3.4.

Additional Information for MySQL

Data stored in MySQL databases with the version of MySQL that is pre-installed Mac OS X Server 10.3.2 or earlier must be exported and re-imported in order to be compatible with version of MySQL that is pre-installed on Mac OS X Server 10.3.3 or later, in which a byte-ordering issue is fixed.

As with any upgrade install, you should back up your old data. In this particular upgrade, the following process is recommended to convert the data to the correct byte ordering:

Before the upgrade, use the terminal to export the data from your pre-10.3.3 database:

```
#  mysqldump -p table > backup-file.sql
```

or

```
#  mysqldump  --opt database > backup-file.sql
```

After the upgrade, and after initializing the MySQL database, import the data:

```
#  mysql -p table < backup-file.sql
```

or

```
#  mysql  database < backup-file.sql
```

AirPort Management Utility 1.0: Cannot change the "Serve DHCP" or "Provide NAT" settings

AirPort Management Utility (AMU) allows you to update base stations en masse. Due to the nature of DHCP and NAT settings, accidentally changing them across a network of base stations could result in a dysfunctional network.
This article has been archived and is no longer updated by Apple.
To prevent that from happening, AMU intentionally disallows modification of these settings. It will, however, report status of these settings.

When you need to change Serve DHCP and Provide NAT settings, use AirPort Admin Utility to do so on an individual basis.

Note: AirPort Management Utility 1.0 may be found on the software CD included with the AirPort Extreme Base Station (PoE/UL 2043).

Final Cut Pro HD: Projects will not open in earlier versions of Final Cut Pro

Earlier versions of Final Cut Pro cannot open Final Cut Pro HD projects. If you attempt it, you get this message:

This article has been archived and is no longer updated by Apple.

"Unable to read file. It appears to have been corrupted."

The project file isn't really corrupted. The older version of the program simply can't understand its new format.

Published Date: Feb 20, 2012

What‘s new in Final Cut Pro HD?

High Definition Video:

This article has been archived and is no longer updated by Apple.

Capturing, editing, and output of DVCPRO HD high definition video Final Cut Pro HD natively supports DVCPRO HD media.

You can capture, edit, and output DVCPRO HD video using the built-in FireWire port on a qualified Power Mac without any additional specialized equipment.

Editing:

Copying and pasting clips follows track selection in the Timeline.

Final Cut Pro HD performs copying and pasting in the Timeline differently than Final Cut Pro 4.1 and earlier. When you copy clips from tracks in the Timeline, Final Cut Pro pastes those clips in the same tracks unless you specify different destination tracks by clicking their Auto Select controls.

For a full description, see the complete PDF version of this document and Final Cut Pro HD Late-Breaking Features.

Late-Breaking Features in Final Cut Pro HD

This document contains late-breaking information about Final Cut Pro HD. For the latest information about product updates, tips and techniques, and qualified third-party devices, visit the Final Cut Pro website (http://www.apple.com/finalcutpro/).

This article has been archived and is no longer updated by Apple.

High Definition Video Support

720p High Definition Video Support Final Cut Pro HD includes support for 720p high definition video, including both uncompressed and DVCPRO HD formats. For more information about high definition video, see New Features in Final Cut Pro HD .

Editing and Trimming

New Menu Commands and Buttons for Trim Edit Window Options Preferences for listening to audio in the Trim Edit window have corresponding menu commands and buttons in the Button List:

Preference	Description	Shortcut key
Dynamic Trimming	Turns dynamic trimming on and off in the Trim Edit window.	Shift-Command-D
Trim with Sequence Audio	Allows you to listen to all sequence audio tracks while trimming in the Trim Edit window.	Command-Option-A
Trim with Edit Selection Audio (Mute Others)	Mutes all audio tracks except the ones currently selected in the Timeline.	Command-Option-Z

Capture and Output

Edit to Tape Can Output DVCPRO HD Sequence Timecode When outputting with Edit to Tape using DVCPRO HD via FireWire, you can choose to use the existing tape timecode or the sequence timecode. This means you can control the timecode written to tape during output. If you choose this option, sequence and output tape timecode match.

Note: This option is available for assemble edits only, which is currently the only choice available when outputting all types of DV media to tape.

Media Management

Media Manager Provides New Master Clip Options A new checkbox labeled "Include master clips outside selection" allows you to:

- More effectively trim media when generating a new project (by specifically choosing not to include master clips outside the current Browser selection to be processed by the Media Manager).
- Control when master clips are created by media manager operations.

Timecode

Logging Without a Device Connected Supports All Timecode Formats When logging in the Log and Capture window, you can now log clips in any supported timecode format without a device connected. The frame rate of the currently selected device control preset determines the timecode rate choices in the timecode fields in the Log and Capture window.
